DANTON, GEORGES-JACQUES (1759-94), French statesman and revolutionary orator. The son of a solicitor of Arcis-sur-Aube and grandson of a peasant, Danton at the outbreak of the revolution was a successful barrister at Paris. He came into politics through the Paris municipal council and the famous Club des Cordeliers. Until the overthrow of the monarchy on the tenth of August, 1792, he remained a local figure, half boss, half agitator. He unquestionably helped prepare the *sections* for the revolt of August 10, and he found himself minister of justice in the provisional government, a leader of the new republic. He helped by his fervent oratory to encourage the French in the war against Austria and Prussia. Elected to the Convention he played for the next two years a difficult role in party intrigues. Danton was an opportunist in the midst of a revolution where interests were clothed—if not indeed shackled—with principles. His policy of balancing led him to oppose Robespierre and his program and, working with his friend Camille Desmoulins, to call for clemency to replace the Terror. He was caught without real support and guillotined in April, 1794.

Danton cannot be said to have contributed to political thought. His speeches are excellent examples of popular oratory, of the art of the man who wishes to move large numbers to group action. They are full of a great deal of material suitable for slogans and stereotypes and have been very useful to schoolmasters of the Third Republic. But they are devoid of original ideas. Danton is important to the newer historian first because of his role in modern French patriotism and second because his methods throw light on the technique of revolution. Yet perhaps his real importance is wholly indirect. What has been written about Danton forms one of the best possible bases for a study of historical method, since the leading exponents of objective, scientific history of the French Revolution have been for years at odds as to his character and role. To Aulard he was a hero and a statesman; to Mathiez a grafter, a potential traitor, a mere demagogue. Agreement has not yet been

reached, although to the younger generation of historians the quarrel has lost importance.

CRANE BRINTON

Works: *Discours*, ed. by A. Fribourg (Paris 1910), tr. into English (New York 1928).

Consult: Fribourg's introduction to the *Discours* above; Madelin, L., *Danton* (Paris 1914), tr. by Lady Mary Loyd (London 1921). The quarrel between *Dantonistes* and *Robespierristes* is best studied in the files of the *La révolution française* (pro-Danton articles by Aulard and pupils), and the *Annales révolutionnaires*, and the *Annales historiques de la révolution française* (anti-Danton articles by Mathiez and pupils).

DARGUN, LOTHAR VON (1853-93), German sociologist and economist. Dargun, who wrote in Polish as well as German, was professor of German law and legal history at the University of Cracow. Sharing the views of Bachofen and McLennan and those who contended that every social group necessarily undergoes a similar course of development he attempted in his studies of the early primitive forms of law, property and the family to derive an evolutionary scheme for the Aryan peoples, particularly the Germans. Thus in *Mutterrecht und Raubehe und ihre Reste im germanischen Recht und Leben* (Untersuchungen zur deutschen Staats- und Rechtsgeschichte, pt. xvi, Breslau 1883) Dargun applied his thesis of the matriarchy as the universally original form of kinship to the case of the Aryans and also advanced the notion that wherever wife purchase appeared it was always preceded by wife capture. Subsequently in *Mutterrecht und Vaterrecht* (Studien zum ältesten Familienrecht, pt. i, Leipsic 1892) Dargun developed the idea that the patriarchy with its legal, protective relationship between father and child replaced by force the blood kinship system of the matriarchy. Dargun's most significant work in economics is *Egoismus und Altruismus in der Nationalökonomie* (Sociologische Studien, pt. i, Leipsic 1885). Here he opposed the one-sided interpretation of eco-

nomic phenomena as arising out of exclusively egoistic motivations of the individual. On the whole, it may be said that his work suffered from a neglect of national differences, an over-emphasis on law and theory in history and a tendency to hasty or preconceived generalizations.

HERMANN TRIMBORN

DARJES, JOACHIM GEORG (1714-91), German cameralist. Darjes was professor of law first at Jena and later at Frankfort on the Oder during the reign of Frederick the Great. He was a leader of the movement which transformed early cameralism into an administrative science presented as a university discipline with the object of training officials for the service of the absolute state. Differing from the classical mercantilists in his specific purpose and in general ignoring their commercial and monetary doctrines, Darjes retained the fundamental mercantilistic idea that the state was entitled to guard its interests by unrestricted intervention in the affairs of the people—a position which he supported in *Discurs über Natur- und Völkerrecht* (3 vols., Jena 1762) by the customary appeal to the peculiar cameralistic interpretation of natural rights. The officials of the state must be scientifically trained not only to levy and collect taxes but to handle the manifold problems involved both in the preservation and development of its capital, defined by Darjes as the combined wealth of its entire population, and in the judicious expenditure of its revenues for the general happiness. Hence for Darjes cameralism in its broadest sense embraced *Polizeiwissenschaft*. Before formulating a policy for regulating industries and agriculture the cameralist must also become intimately acquainted with various technological processes as well as with the pecuniary aspects of production. Darjes himself made interesting calculations of the rentability of certain representative farms and manufacturing plants and manifested an insight into the problem of amortization which helped him to arrive at an accurate analysis of production costs. In his treatment of public enterprises he speculated as to the optimum size of plants and the most advantageous proportion of factors. In spite of the emphasis which he placed upon the importance of an empirical foundation he was chiefly concerned with expounding the principles of the science of management rather than with describing the actual processes. In this respect he differed from the first cameralistic

professors, Dithmar and Gasser. Darjes' capacity for systematization, attributable in part to his training under Christian von Wolff, is perhaps the distinguishing merit of his *Erste Gründe der Cameral-Wissenschaften* (Jena 1756), an admirably successful attempt to shape an encyclopaedic mass of material into an ordered whole suitable for presentation to university students.

LOUISE SOMMER

DARWIN, CHARLES ROBERT (1809-82), English naturalist. He was born at Shrewsbury, the grandson of the scientist Erasmus Darwin. He collected the basic evidence and obtained the initial inspiration for his theory of evolution during his voyage as a naturalist on the *Beagle* between 1831 and 1836. Illness prevented him from ever leaving Great Britain again and he remained at his home in Down patiently experimenting with plants to verify his hypothesis. His first public statement of the evolutionary theory was made in 1858 simultaneously with a comparable formulation of the hypothesis by Alfred Russel Wallace. His epoch making book, *The Origin of Species*, appeared in 1859, and the fifty years that followed its appearance might well be called the Darwinian era in biology, psychology and the social sciences. For while he was only one of many mid-century evolutionists and always remained a laboratory worker, leaving the polemical work to be done by Huxley, Spencer and Haeckel, his work was so thorough and so far reaching in its implications that it became the central agency in a revolution of thought in all the humanistic studies. Even today evolution is popularly conceived to be his doctrine of descent. By placing man wholly within the organic realm he upset creationism, raised doubts as to the unique spiritual nature of man, undermined belief in miracles, revelation and answer to prayer, destroyed the myths of the fall and original sin and compelled a complete recasting of the argument from design and of theology in general. In addition, his emphasis on continuity and naturalism stimulated extensive inquiries into the origin,

nature and evolution of ideas of the soul and of religious beliefs and practises. The religious controversy thus aroused still rages in certain quarters, although elsewhere the logical outcome of his discoveries is only now being formulated as naturalistic humanism.

Darwin saw that the connecting link between biological and psychological evolution is to be found in instinct. While his treatment of instinct is somewhat influenced by Lamarckianism, he made variation, natural selection and heredity the chief sources of innate adapted responses, of the emotions and their expression, of play, the "social instincts" and intelligence. He thus gave a new orientation to researches in comparative, genetic and animal psychology and mental inheritance. His position ultimately affected the conception of the nature of mind itself. Since continuity on the organic plane implies inheritance, the evolution of mental traits must have rested on organic changes. The outcome could be none other than a behaviorism which considers mind, including consciousness, as not an entity but the functioning of psychophysical structures.

His influence on anthropology was largely in stimulating researches on the origin of man and human races. He raised expectations regarding "missing links" and fossil men which have in part been realized and intense interest in the now partially delineated genealogical tree of man. His views stimulated the study of the comparative anatomy and physiology of races, the effects of race crossing and of environmental selection and racial adaptations and modifications due to temperature, moisture, altitude, sunlight and type of food.

The Darwinian concepts were transferred from the biological to the ethical, political, economic and sociological fields. Darwinism as an expression of a fundamental law of nature became a new orthodoxy to which appeal was made to justify diverse opinions in many spheres. It was invoked to explain social evolution in general and to support individualism and socialism, competition and cooperation, aristocracy and democracy, brute force and kindness, militarism and pacifism, ethical pessimism and optimism, creative emergent evolutionism and evolutionary naturalism.

Darwin's discoveries were directly responsible for intensive study of human heredity—the relative influence of heredity and environment in individual differences and the rise of eugenics, as typified by Galton and Pearson; for the theories

of the social selectionists, such as Ammon and Lapouge, as to the effects of differential fertility, migration, urbanism, poverty and other social conditions on human stock and social progress; and for the vast literature of social Darwinism on the biological, ethical and social significance of competition, conflict and war, as in the works of Bagehot, Kidd and Gumpłowicz versus Kropotkin and Novicow. His theories gave rise to such influential doctrines of racial supremacy and racial determinism as Aryanism and Nordicism.

DAS, "DESHBANDHU" CHITTA RANJAN (1870–1925), Indian nationalist. Das was the son of a Brahman intellectual. He received an English education, earned a fortune as a lawyer and made his first contact with politics as defense counsel in political cases. In 1917 he was president of the Bengal Provincial Conference and delegate to the Indian National Congress. In December, 1920, he made a political pact with Gandhi, abandoned his law practise and adopted a Spartan mode of life. Elected president of the Indian National Congress of 1921 he was unable to serve because of his arrest, followed by six months' imprisonment. The withdrawal of the boycott against the government and Gandhi's imprisonment in 1922 gave Das an opportunity to become the leading Nationalist figure. As president of the congress of 1922 he launched a new program, which urged participation in politics. His Swaraj party won a plurality in the Bengal legislature in 1923,

and in the Calcutta Corporation in 1924, making Das mayor. In 1923-24 he played an important role in the trade union movement.

His program was representative of the liberal bourgeoisie of India, opposed to Great Britain and the native feudal aristocracy of princes. His demand for Swaraj (self-government) was never clearly defined. He desired decentralization, emphasizing village autonomy, but preferred to remain within the British Empire if it would assure scope for the growth and development of India's life. He often changed his policy. After opposing non-cooperation he accepted it, then abandoned it again for active obstructionism. The Swaraj party rejected the Montagu-Chelmsford reforms as insufficient, refused to form a ministry in 1923, opposed the payment of salaries to ministers in 1924 and 1925 and forced the suspension of diarchy in Bengal. With the rise of a revolutionary wave Das again changed his policy. His repudiation of violent revolution on ethical as well as practical grounds aroused the attention of the India Office and led to negotiations in which Das showed a readiness to cooperate with the imperial government even to the extent of forming a ministry and approving the Montagu-Chelmsford reforms. His labor policy was undefined; he offered no program beyond favoring some social legislation contradictory in essence neither to capitalism nor to western civilization. He argued that administrative decentralization would save the Indian masses from being ruled by a native bourgeoisie and bureaucracy after self-government had been attained. Communist doctrine he opposed vehemently. He set a personal example as a social reformer by encouraging his three children to marry outside their caste. A few months before his death he made over his properties to philanthropic enterprises administered by his wife.

J. VIJAYA-TUNGA

Consult: Ray, P. C., *Life and Times of C. R. Das* (London 1927); Roy, Evelyn, "The Metamorphosis of Mr. C. Das" in *Labour Monthly*, vol. iv (1923) 363-76; Kohn, Hans, *Geschichte der nationalen Bewegung im Orient* (Berlin 1928), tr. by M. M. Green (London 1929).

DATO E IRADIER, EDUARDO (1856-1921), Spanish jurist and statesman. His name is associated with the introduction into Spain of effective legal measures for the protection of workers. As minister of the interior he was called upon to promulgate two laws which mark

the beginnings of thoroughgoing Spanish labor legislation—the labor accident law of January 30, 1900, and the law of March 17, 1900, dealing with female and child labor. Although a representative of conservative interests Dato during the serious controversies aroused by the former law lent his influence as a jurist to the modern theory of occupational risk, defending it as more just, despite the added burden to employers, than the classic theory of liability. Thereafter he maintained a continuous interest in the progress both of social legislation in Spain and of international organization directed toward similar ends. During the World War he was absorbed as president of the ministerial council in preserving Spanish neutrality; but in 1920 he again manifested his interest in the reform movement by revitalizing the Instituto de Reformas Sociales and still more by creating the ministry of labor, which should constitute an official agency for extending the work of this institute. Ironically enough, Dato was assassinated, during a period of great unrest in Madrid, by a member of the syndicalist party.

Eduardo Dato e Iradier . . .," and Moreno Calderón, A., "Significación social y jurídica de Eduardo Dato" in *R. Academia de Jurisprudencia y Legislación, Publicaciones*, no. xxxvii (Madrid 1921), and no. lxi (Madrid 1922); Madariaga, Salvador de, *Spain* (London 1930) p. 389-418.

DĀ'ŪD AL-ZĀHIRI (b. Khalaf al-Isfahāni Abū Sulaymān) (815-83), Arabic jurist. Dā'ūd studied under various leading theologians and settled in Bagdad, where he acquired a large group of pupils. None of his writings are extant, but his doctrines have been reconstructed from quotations by later authors.

Dā'ūd al-Zāhiri means David the literalist, and his school of Mohammedan law marks a distinct reaction from the liberalizing tendencies of al-Shāfi'i. Of the four sources of authority in Mohammedan legal philosophy, the Koran, prophetic usage, analogy and the consensus of opinion, he accepted only the first two. He rejected analogy entirely and admitted the consensus of opinion only in the limited sense of the agreement of the immediate companions of the prophet. He based his law upon the Koran and the usage of Mohammed and insisted upon a literal interpretation of both. To go beyond the strict meaning of the words was to err in the direction of analogy. He had of course

eventually to admit analogy into his system; for as an earlier jurist had pointed out, the number of possible cases was unlimited, while the number of authentic decisions of the prophet was limited, a gap which at times could be bridged only by the use of analogy. Dā'ūd insisted, however, that where analogous cases were admitted they should be considered only as a proof and not as a source of law, a somewhat meaningless distinction. He also held that the reasons for a decision of the prophet could be investigated only when they were clearly stated. He refused to infer the reasons or to apply those stated in one case to a decision in another case.

The Mohammedan world soon discovered that the uncompromising doctrine of the Zahirite school made it impracticable. Most Moslems held that a Zahirite could not legally act as a judge. Yet for centuries Zahirite doctrine had a following among the common people, who could not understand the somewhat involved reasonings of other jurists and who preferred to base their law upon "the word of God" and the clear statements of His prophet. It gained a strong foothold in northern Africa and in Spain.

WILLIAM M. RANDALL

Consult: Goldziher, Ignacz, *Die Zāhiriten, ihr Lehrsystem und ihre Geschichte* (Leipzig 1884).

DAVANZATI, BERNARDO (1529-1606), Italian merchant and economist. After living for a time in Lyons he established himself as a merchant in Florence. Davanzati had many literary interests: he wrote a history of the Reformation in England (*Scisma d'Inghilterra*, Rome 1602) and his translation of Tacitus (Florence 1637) at once took its place as a masterpiece of Italian literature. He was a member of the Florentine and other academies.

Davanzati's contributions to economics are contained in two short essays: *Notizia dei cambi* (1582), dealing with foreign exchanges, and *Lezione delle monete* (1588), a lecture on money delivered before the academy in Florence; both of which are published in his *Opere* (ed. by E. Bindi, 2 vols., Florence 1852-53, vol. ii, p. 425-57). Except for a few unimportant quotations he does not appear to have been influenced by the canonistic literature on the legitimacy of usury and of dealing with foreign exchange. His approach is that of a merchant who analyzes facts and attempts to explain them. He recognizes the economic function of

the foreign exchange market and describes the variations of exchange rates around par and between gold points which are fixed by the amount of interest lost pending the transmission, the cost of carriage and risk. Between these points exchanges fluctuate according to the supply and demand of bills.

Davanzati was one of the first writers to point out the quantitative relationship between the volume of money and the level of prices and explained the great increase in prices in the sixteenth century by the influx of gold from America. He was in favor of free coinage and severely criticized princes who debased their currency for the sake of an immediate gain and to the detriment of public finance, creditors and society as a whole. He also noted the influence of scarcity and subjective utility as factors in price determination.

LUIGI EINAUDI

Consult: Noaro, G. C., *La teoria dei cambi esteri di Bernardo Davanzati* (Rome 1920); Arias, G., "Davanzati et Montanari" in *Revue d'économie politique*, vol. xxxvi (1922) 733-50; Sewall, H. R., "The Theory of Value before Adam Smith" in *American Economic Association, Publications*, 3rd ser., vol. ii, no. 3 (1901) 52-55.

DAVENANT, CHARLES (1656-1714), English writer on economic and political subjects. From 1683 to 1689 Davenant held office as commissioner of excise and from 1705 to 1714 as inspector general of exports and imports. He was three times elected to Parliament, in 1685, in 1698 and in 1700. Whether or not he was influenced by his attachment to the Tory party and by his violent antipathy to the Whigs, whom he satirized in his animated *True Picture of a Modern Whig* (3 vols., London 1701-07), Davenant consistently attacked the Whig policy of restriction of trade with France. Fundamentally, however, despite isolated evidence in his acts and writings which seems to point toward economic liberalism Davenant was in agreement with the current mercantilistic theories of his time. He deplored evasions of the navigation acts and believed in regulating the development of plantations. When he declared in his *Essay on the East India Trade* (London 1696) that "trade is in its Nature free, finds its own Channel and best directeth its own Course," he added that government should take a "providential care" of its general workings. The chief arguments of this essay, written to defend the East India Company in the controversy over the effect of its importation of Indian

textiles on English woollens, were based on practical rather than theoretical grounds, namely, that large quantities of these imports were re-exported to the continent and that any limitation imposed by England would divert the trade to the Dutch. English interests would best be served by a reduction in the production costs of English woollens so that wider markets could be gained abroad. This purpose could be achieved if the poor were properly set to work, for Davenant unreservedly accepted the contemporary assumption that a large population, fully employed and living near the subsistence level, would necessarily contribute to the increase of national wealth. In monetary questions Davenant was the most enlightened of his contemporaries. His *Discourses on the Publick Revenues and on the Trade of England* (2 vols., London 1698) asserted that "Money is at Bottom no more than the Counters with which Men in their dealings have been accustom'd to reckon" and that its value, like that of all commodities, was determined by its "want or scarcity." Perhaps his most notable observation on the money problem, contained in the same treatise and emphasized by his citation of the example of Spain, was that "Gold and Silver are often a surfeiting Diet to a Nation; and there may be as well too much as too little of this kind of Treasure, if it be not turn'd to proper Uses." Davenant was deeply interested in political arithmetic, which he defined in terms that have since become classical as "the art of reasoning by figures upon things relating to government." In his *Essay upon the Probable Methods of Making a People Gainers in the Ballance of Trade* (London 1699, 2nd ed. 1700) he endeavored to correct what he regarded as the lamentable recklessness of his adversaries in the use of figures by extensive quotations from the estimates of Gregory King. It was through Davenant's *Essay* that these estimates (which were otherwise available only in manuscript) became public and served as the basis for much eighteenth century statistical discussion.

Davenant; Ein Beitrag zur Kenntniss des englischen Mercantilismus, Beiträge zur Geschichte der Nationalökonomie, vol. vii (Jena 1930); Ashley, W. J., "The Tory Origin of Free Trade Policy" in his *Surveys, Historic and Economic* (London 1900) p. 268-303.

DAVENPORT, HERBERT JOSEPH (1861-1931), American economist. Davenport spent two years at Harvard Law School and two more in study abroad and received the doctorate in political economy from the University of Chicago in 1898. He returned to high school teaching for another four years and in 1902 became an instructor at the University of Chicago. In 1908 he went to the University of Missouri as head of the department of economics and from there to Cornell University, where he taught from 1916 to 1928. Davenport commands consideration both as an economic theorist and as a teacher. He was the author of several economic textbooks and of numerous articles in economic periodicals, such as the *Journal of Political Economy*, the *Quarterly Journal of Economics* and the *American Economic Review*. His two principal books are *Value and Distribution* (Chicago 1908), a critical survey of economic doctrines and *The Economics of Enterprise* (New York 1913), an exposition of his own system. He left in manuscript a critical study of Marshall which represents in a sense the culmination of his criticism of classical and neoclassical theory.

In economic theory Davenport's guiding principle was to keep attention fixed on the facts of price and price relations and on competition between gain seeking entrepreneurs as the process determining prices, including the distributive payments. In all this he recognized the conservative, back-to-Smith character of the emphasis and also acknowledged the leadership of Cannan in "the return to the better way." This approach at once involved the scrapping of the Ricardian rent concept and the reduction of utilities and costs to purely relative terms. Davenport was thus the leader in a vital crusade against all notions of the determination of prices or control of economic activity by real values or real costs. The detailed features of his work involve issues which are more controversial. One point which he greatly stressed and for which he claimed originality was the loan-fund doctrine of capital. Here he grasped a fundamental problem, although he may not receive credit for a major original contribution to its solution. The post-war work on money and economic cycles by British, German and Scandinavian writers has

built rather upon Wicksell, who undoubtedly had a deeper insight; but Davenport arrived at his views independently, although they were not altogether new. An important limitation of Davenport's thought was that he never learned to think on economic problems mathematically even in such fields where little special technique was required. Therefore he never fully understood some essentials in a pure theory treatment, such as continuous variability and the role of small increments, especially in relation to variability of proportions of joint factors, as well as the notions of mutual determination and general equilibrium.

These technical deficiencies of Davenport's thought are probably explained by a division of interest, the extent of which he never realized. Davenport was a reformer and sometimes, perhaps, a reformer before he was a scientific analyst. His reformism ran in the direction of "stalwart individualism," that is, contrary to the state socialism which dominated social radicalism in his generation. Very significant is the final sentence of the preface to *The Economics of Enterprise*, in which he inveighs against monopoly and especially against "the monopoly, so far enjoyed by the reactionaries, of all authoritative economic doctrine." Another discordant factor was the combination of a logical mind and a craving to generalize with a bent for realism, somewhat opposed to abstraction and theoretical refinement as such. He even liked to play with ideas and words, so that his works are not easy reading; but he was not concerned to think his conflicts through. In particular he did not carry his anti-apologetic attitude in theory through to an analysis of the grounds for failure in the competitive system nor did his radical individualism lead to an elaboration of a concrete program of reform. He combined an almost fervent admiration for Veblenism with personal work conspicuously conservative and "sound." So too he could advocate the single tax "in principle" while opposing its inequity in application. For such reasons his work lacked apparent unity and constructiveness and he tended to remain something of a voice crying in the wilderness.

As a teacher especially Davenport was a radical. He believed in education as a creative activity on the part of the student and abhorred lecturing to his classes, although he loved rhetoric and dialectic and on the platform could be impressive and even moving. Moreover, he had the moral courage lacking in most teachers of

similar convictions: he could remain silent before a class until someone else started a discussion and even while the group wrangled over irrelevancies. He was a real teacher.

FRANK H. KNIGHT

DAVID, EDUARD (1863-1930), German economist and politician. He studied history and philosophy and became a college teacher but soon abandoned this profession and started his public and political career as a member of the Social Democratic party, which he had joined as a student. He was one of the very few academically educated people who joined the Social Democratic party during the last century, and his influence on its development in Germany was manifold. He founded and edited several Social Democratic newspapers, and his scientific works, which dealt especially with the agrarian problem, were of greatest significance. Chief among them was *Sozialismus und Landwirtschaft* (Berlin 1903, 2nd ed. 1922). In decided contradiction to the teachings of Karl Marx, David tried to prove that the agrarian development was not leading inevitably to the establishment of large sized holdings and that the maintenance and further enlargement of a peasant class under a system of intensified agriculture was economically necessary and desirable. He maintained that this was compatible with socialism and favored peasant proprietorship. The practical agrarian policy which he and the Social Democratic party followed was largely based on these results of his studies. David took an active part in the struggles which were taking place at the turn of the century in the Social Democratic party on the question of whether the party should follow a more evolutionary or a more revolutionary program. He was on the whole a follower of Bernstein and an opponent of Kautsky and Bebel and was one of the ablest leaders of the revisionists.

David was also an important parliamentary figure. He was a member of the parliament of Hessen from 1896 to 1906 and of the Reichstag, where he often exerted considerable influence, from 1903 until his death. His influence was greatest in February, 1919, when he became the first president of the national convention which drew up the new Weimar constitution of the German Republic. One of the first German Social Democrats to accept a high political office, David entered the cabinet during critical periods in German history. He became under secretary of foreign affairs under the kaiser in

October, 1918, when the imperial government was placed on a parliamentary basis; and he was a minister of the republican government from February, 1919, until June, 1920. During the latter period as minister of the interior David was responsible for the final steps and decisions in drafting the new constitution and in passing it through the Constituent Assembly.

OTTO NATHAN

DAVIDS, THOMAS WILLIAM RHYS (1843-1922), British orientalist. He was born in Colchester and after studying Sanskrit with Stenzler at Breslau went in 1864 as a civil servant to Ceylon, where he studied under Buddhist monks, especially Yatrāmullē. He was a notable popularizer and produced the little manual *Buddhism* (London 1878, 23rd ed. 1914), which is the basis of popular western ideas on the subject and is still a standard work, and others of like nature. As founder of the Pali Text Society and its chief scholar he performed a task as important for the study of history, anthropology, philology and religion as was the publication of the Vedas, inasmuch as the works of the Buddhist elders made available by the society are proving of great and increasing value in correcting and amplifying those of the Brahmins. After nearly half a century of strenuous work Rhys Davids left the Pali Text Society with its library almost complete, with about 25,000 octavo pages printed and with a great Pali dictionary well under way. His widow and his chief helper, Dr. Caroline Rhys Davids and Dr. William Stede, are completing the work.

Davids was professor of comparative religion at Manchester from 1904 to 1915. Although he succeeded in reconstructing the political and social setting of early Buddhism he did not see it clearly enough as an organic part of Brahmanism and assumed too readily that the Pali canon represents a primitive Buddhism. He made a rationalist of the Buddha and of *Nibbana* an ethical rather than a mystical experience, and he gave too little place to textual criticism.

K. J. SAUNDERS

DAVIDSON, THOMAS (1840-1900), Scottish born philosopher and educator. After teaching at various schools in Great Britain and Canada, and in St. Louis under W. T. Harris, Davidson in 1875 broke away from academic connections to become a free lance scholar. In the early sixties he had imbibed the religious radicalism then emanating from Germany and from revolution-

ary French émigrés, like Louis Blanc, at that time in London. But in the eighties he became closely associated with the Rosminian Order of Charity in Italy, translated and edited in 1882 Rosmini's *Sistema filosofico* and was on the point of joining the editorial staff of the Vatican Edition of St. Thomas. His Scottish individualism, however, made it impossible for him to accept the discipline and politics of the Catholic church, much as he admired its art and religious philosophy. In such a mood during a short stay in London in the winter of 1882 he interested a group of young men and women in a society for religious, ethical and social regeneration. With this nucleus the Fellowship of the New Life was formed, with Havelock Ellis, Edward Pease, William Clarke, Hubert Bland and Percival Chubb among its members. The majority, led by Frank Podmore, soon broke away and organized the Fabian Society, devoted primarily to political and economic questions and taking a socialist turn. The fellowship continued, however, for fifteen years and published a quarterly, *Seedtime*, from 1889 to 1898. In 1884 Davidson organized an American branch of the fellowship. In the same year he became associated with the Concord School of Philosophy and thereafter himself conducted summer schools of philosophy or of the cultural sciences, first at Orange, New Jersey, then at Farmington, Connecticut, and finally from 1890 to the end of his life at Glenmore, near Keene, in the Adirondacks. In the final stage of his thought he tried to establish a religious basis for democracy in a pluralistic, individualistic and extremely subjectivistic philosophy. He became associated in 1898 with the Educational Alliance on the East Side of New York and in his plans for a Breadwinners' College found the educational work most congenial to his interests and ideals. His plan was to make cultural studies available to persons working in the daytime. In the last two years of his life he gave the movement such an impetus that it continued for eighteen years after his death.

DAVIES, DAVID (d. 1819?), English writer on the poor laws. Davies, the rector of a rural parish in Berkshire, wrote a protest, *The Case of Labourers in Husbandry* (Bath 1795), concerning the struggle for subsistence of the class represented by his parishioners. His book, addressed to the newly formed Board of Agriculture, is based chiefly upon a series of brief family budgets gathered by himself and other clergymen during 1787; it thus antedates Sir Frederick Eden's more famous series by nearly a decade. Davies, writing just before the scarcity of 1794-95, already draws a very black picture. The poor rate, he finds, is being used in lieu of wages. Whereas at least ten shillings is necessary to support life in a family of five, the common weekly wage is only seven or eight shillings. At least a fifth of his own parish receives relief. Not one child in three receives any schooling. Davies' budgets bear him out: his families spend from 75 to 80 percent of their income on food ("it is but little that the belly can spare for the back"), and that food is almost entirely bread.

Davies advocates a minimum wage, similar to that subsequently embodied in Whitbread's bill, to be set, consonant to the Statute of Elizabeth, by the local justices of the peace in accordance with changes in the price of bread. It should suffice to support two young children. For additional children the poor rate should furnish partial payment in kind without attaching to the recipient the stigma of pauperism. All persons over eight years of age should support themselves. For the unemployed, after proper registration, there should be another automatic allowance equal to two thirds of full wages. Parish officers are to be responsible for furnishing work wherever possible.

Davies is typical of the best humanitarianism of his period. Although he is temperate and circumscribed in suggesting remedies his description of conditions is strikingly frank.

DOROTHY W. DOUGLAS

DAVIES, (SARAH) EMILY (1830-1921), English feminist and educator. A sister of J. Ll. Davies, who was cofounder with F. D. Maurice of the Workingmen's College, she became during the sixties a leading figure among the pioneers of the women's movement, to which she had been introduced by her friend Madame Bodichon. When in 1864 a Schools Enquiry Commission was appointed to make the first systematic survey of English secondary education, Emily Davies recognized a unique oppor-

tunity for directing the government's attention to the neglected question of girls' education. She agitated for and secured the inclusion of girls' schools in the inquiry, a step which led directly to the establishment of the modern system of girls' schools and to university education for women. In 1865 largely through her exertions Cambridge opened its local examinations to women. She then organized a movement for establishing a woman's college of university rank, which led to the foundation of Girton College, Cambridge, opened in 1869. For thirty-eight years she devoted to this college her remarkable powers of organization.

During her earlier years in London Emily Davies took part in the first women's suffrage agitations (1865-67). She resigned this work in order to devote herself to Girton, but resumed it in 1904 and voted at the age of eighty-nine in the first election open to women.

Emily Davies' great aim was to secure for women equality of opportunity with men, and it is largely because of her that there is now no intellectual field in England from which women are excluded. Although her principal achievements were in education, she was an organizer and agitator rather than an educationist. Her bent of mind was conservative and in her later years she strongly opposed the militant suffrage movement. She published two books, *The Higher Education of Women* (London 1866) and *Thoughts on Some Questions Relating to Women* (Cambridge, Eng. 1910), as well as many magazine articles and pamphlets.

DAVIS, JEFFERSON (1808-89), American statesman. Davis had a humble birth and a migratory childhood, but these were offset by a West Point education, life among Mississippi plantation gentry and the strong personal influence of a prosperous and patriarchal elder brother. Entering federal politics as a Democrat he supported the war against Mexico and served in it with distinction as a colonel of volunteers. On his return to Washington he was, whether as senator or secretary of war, a steadfast advocate of enlarging and improving the United States army. From the time of the Wilmot Proviso, however, he was most keenly concerned with safeguarding the South against the possibility that northern power would overturn the existing

racial adjustment as embodied in Negro slavery. Dissatisfied with the Compromise of 1850 he contemplated secession with some favor at that time, adopting Calhoun's doctrine of state sovereignty and insisting that slave territory must be extended if the Union was to be preserved. The revival of the crisis in 1860 put him into the forefront of the movement for southern independence and paved the way for his selection as president of the Confederate States. In that office he showed more weakness than strength. His financial policies were unwise and his interferences with strategy sometimes disastrous; his avoidance of personal contacts and particularly his proneness to controversy were damaging to public morale. In his second year as president he lost control of the Confederate Congress, partly because of the doctrine of state sovereignty, which was turned against him when his intense concern with waging effective war led him to resort to policies of doubtful constitutionality. When the drain on the Confederate armies became too great he entertained the idea of enrolling slaves as soldiers and emancipating them after the war, but this ran too radically counter to ingrained southern ideas to escape violent opposition. Before the end of the war ill health and manifold misfortunes reduced him to psychopathic denials of reality. The collapse of the Confederacy, however, found him sane enough. In flight from Richmond, seeking an exit from American jurisdiction, he was captured in Georgia and imprisoned but was later freed. In a mellowing, dignified old age he was widely beloved among the southern people as a relic and symbol of the "lost cause."

DAVITT, MICHAEL (1846–1906), Irish nationalist and agrarian reformer. Davitt, who in contrast to Parnell and other Irish nationalist leaders was born of peasant stock, lived as a child in Lancashire, where his family had

emigrated following the Irish famine of 1847. His father had been an agrarian agitator in Ireland, and from an early age Davitt himself was associated with the Fenian movement. In 1870 he was convicted of treason felony and sentenced to fifteen years penal servitude. After serving seven, however, he was released on ticket of leave and followed his family to America. During his years in prison he had convinced himself that extreme revolutionary methods should be abandoned in favor of a constitutional program linked to the agitation for land reform. These views were confirmed and expanded by his association with Henry George in America. On his return to Ireland, therefore, Davitt attempted, although with little official encouragement, to institute a new type of nationalist movement, contrasted on the one hand with Fenianism, on the other with Parnell's parliamentarianism. In 1879 he founded the Land League, with a platform declaring for the abolition of landlordism. For a time there was a close alliance between Davitt and Parnell, which was seriously weakened, however, in the period following the suppression of the Land League (1882) by Parnell's repudiation of Davitt's campaign for land nationalization. After the O'Shea scandal Davitt joined the anti-Parnellite section of the nationalist movement but subsequently helped William O'Brien found the United Irish League, which effected a reconciliation with the Parnellites. He was strongly opposed to the Wyndham Land Purchase Act of 1903, which because of its extreme concessions to the landlords he regarded as a nullification of his life's work. This work constitutes the connecting link between revolutionary and constitutional nationalism as well as between nationalism and agrarian reform. Davitt was also instrumental in bringing the Irish Nationalist party into contact with Fenians in America. His social views were more radical than those of his colleagues in the nationalist movement, being colored by collectivism, agrarian socialism and anticlericalism. His personal character, however, was so high and his patriotism so disinterested that he secured the respect and admiration even of those who disagreed with his views.

GEORGE O'BRIEN

DAWES PLAN. See REPARATIONS.

DAWSON, SIR JOHN WILLIAM (1820-99), Canadian educator. Dawson was educated at Pictou Academy, Nova Scotia, and at Edinburgh. He was a pioneer geologist and earnestly encouraged the Canadian geological surveys upon whose work the great Canadian mineral development since 1890 has been based. He had a great gift for popularization, and in books and articles running to editions of tens of thousands he labored on behalf of his generation for the reconciliation of natural science with religion and against the Darwinian variation theory. No nineteenth century educator with the exception of Ryerson left a broader mark on Canada. Convinced not only that popular education was necessary in the Canadian communities which had recently become self-governing but that it must keep pace with the growth of scientific knowledge, he set up from 1850 to 1853 the comprehensive educational system of Nova Scotia and carried his ideas to New Brunswick in 1854 and to bilingual Quebec in 1855. Here he laid down the main outlines of a system to preserve and encourage the culture of the English speaking minority. Also, by affiliating McGill University with smaller institutions in Quebec and elsewhere in Canada he started a process which ultimately extended the university's influence nationally from the Atlantic to the Pacific. He was principal of McGill from 1855 to 1893. He found it on the edge of oblivion and, having won the support of wealthy Montrealers, left it one of the world's great universities, whose professional graduates not only served the growing Canadian community but went as well to Great Britain and the United States. As early as 1869 Dawson endeavored to extend higher education to women, although he objected to coeducation, and he was able to provide university classes for them after 1884. His great mark on national education, however, rose from the insistent emphasis which he placed on the close relation of scientific advance to professional training. To him may be credited a large share in promoting high standards of Canadian education in medicine and the various branches of engineering (notably, of course, geology and mining) as well

as in pure science. The impetus for the study of anthropology in Canada was provided by Dawson's son, George Mercer Dawson (1849-1901).

Dawson's autobiography, *Fifty Years of Work in Canada*, was published posthumously (London 1901).

DAY NURSERY. The day nursery, or crèche, is primarily a by-product of the world wide industrialization of women's work. The participation of mothers of young children in occupations additional to those of housekeeping and family care preceded the industrial revolution, but it is only within the last hundred years that any considerable number of mothers of young children have engaged in work which takes them away from the child and the home. At the outset of this period the creation of the day nursery was primarily a result of charitable effort to alleviate the problem of neglected children. At the present time day nurseries may be classified as charitable, commercial, industrial or employers' crèches in factories or factory vicinities and crèches which are municipally controlled or aided either as a separate unit or in connection with schools or other public institutions.

The rise and most rapid development of the day nursery movement in the nineteenth century occurred in France, although the first day nursery was founded at Detmold, Germany, in 1802. The early realization of the effects of a constantly declining birth rate in France at the time when the birth rate in other European countries was rising and of the high percentage of infant mortality in districts housing working mothers has undoubtedly been a factor in this development. The first day nursery in France to survive was founded in 1844 at Chaillot, a suburb of Paris, by Firmin Marbeau, whose investigations as to the causes of excessive infant mortality, especially for children under two, led him to correlate the death of children with the neglect due to the absence of their working mothers. In 1846 Marbeau founded the Crèche Society of France with the idea of fostering such child care throughout the country, and within thirty years there were 130 crèches in France, 40 in the department of the Seine alone. Other continental countries followed the example of France

A legal status was definitely given to the *crèche* in France by decree of 1897 and provision was made for regular inspection of its operations. Government encouragement, including local and national subsidies granted to those whose requirements met standards, has influenced the development of the day nursery movement there.

Factory *crèches* with provision for employed mothers to leave employment at certain periods in order to nurse their babies have been a continental development, often meeting with public approval and support. In Italy the first factory nursery, created through a cooperative effort of workers and employers, was sponsored by the organization, *Umanitaria*, in 1909. The first factory *crèche* in France was opened in 1846 at Beauvais, and by 1912 such *crèches* had been established in fifty factories.

The earliest factory *crèche* in Germany was opened in 1874 at Linden, near Hanover, and in 1877 a *Crèche Association* was organized in Berlin. By 1913 day nurseries existed in most of the large cities, and in that year, impressed by the extensive industrialization of women's work, the minister of the interior urged factory inspectors to advocate the institution of factory *crèches*. Many municipal *crèches* have been opened in Germany since the war and in Dresden municipal authorities have undertaken the entire financial responsibility. The day nurseries in Charlottenburg and since 1917 in Lübeck have been connected with the elementary schools. But in spite of this rapid growth most children of working mothers are still "boarded out"—left to the care of relatives or neighbors—a type of care preferred by many competent authorities in Germany.

As the industrialization of women's work increased, other countries—Spain, Italy, Austria, the Scandinavian countries, Russia, India and Japan—adopted the day nursery idea.

In England the first day nursery was opened in 1850, but due to lack of public support and the meagerness of private philanthropic efforts the movement has not spread as rapidly as on the continent. Somewhat similar experiments, such as the Country Home for Nursery Children at Tunbridge Wells, which is open the year round for day nursery and other children in need of such care, were later undertaken.

In the United States the movement was at its outset largely philanthropic. The first day nursery in the country was opened in 1854 by the Nursery and Child's Hospital of New York

City to provide daytime care for children of working mothers who had been patients at the hospital. The oldest institution still in existence is that which was founded in Troy, New York, in 1858. The social effects of the Civil War led to the establishment of the First Day Nursery in Philadelphia in 1863 and to similar nurseries elsewhere. In addition to the philanthropic enterprises there sprang up individual enterprises on a commercial basis. The movement was sufficiently widespread by 1898 to lead to the foundation of a National Federation of Day Nurseries.

The most important developments in the day nursery movement in the United States and in Europe as to both the number of nurseries established and the type and quality of care provided took place during the World War and have continued since that time. The sudden great increase in the number of working mothers, due to the shortage of other types of labor, led to a realization on the part of most European countries of the need to provide some form of care for their children under government supervision and often with government aid. The governments of England, France and Germany gave their sanction and aid to the opening of day nurseries in munition centers, and in Italy alone eight hundred factory nurseries, *nidi* (nests), were opened during the war period. France by its legislation of 1917 provided allotted rest periods and in cases where more than a specified number of women were employed a rest room for mothers of nursing children. Subsidies were granted to day nurseries, amounting in the case of the English nurseries to 50 percent of their expenditure, and were regarded as measures both of war relief and of education. The reported existence in 1922 of 150 day nurseries in England and Wales may be laid to this encouragement. In Scotland, where the system of boarding out is preferred, only 20 such day nurseries were reported. These subsidies were considered necessary supplements to the provisions through maternity grants for financial assistance to mothers during the period of confinement. There has developed an increasing tendency for public bodies to make government supervision more stringent in order to develop new and better standards of housing, equipment, medical provision and personnel.

In the United States no similar system of public day nurseries or of public aid or subsidy to private institutions developed during the war. Nevertheless, in 1923 there were 22,822 children

in 613 nurseries; and the magnitude of the problem, particularly as it was disclosed by studies of the high rate of infant mortality among children of working mothers, led to ... awakening of interest on the part of government bureaus and social workers' organizations. Up to 1919 the discussion of the day nursery was not scheduled on the programs of the National Conference of Social Work; state surveys of work for children, prepared by national welfare organizations, made little or no mention of the nursery. The lack of public control and supervision led to grave abuses especially in the commercial day nurseries, which were closely allied to the notorious "baby farms." In 1924 out of forty-eight states only six had some measure of state protection and thirteen had no state or city provisions for licensing of day nurseries. At the present time state boards of health and welfare are exercising increasing control over nursery work.

Part of the neglect of the problem has been due perhaps to the widespread disparagement of the day nursery as an institution of child care. In all countries there has been a belief that public funds might better be apportioned among the mothers themselves. In many instances there has been a preference for the boarding out system. It has been pointed out that the day nurseries have never been popular with working mothers either in the United States or in Europe. A study made in Philadelphia in 1918 showed that out of 558 working mothers with small children only 9 percent used day nurseries, although the families lived in parts of the city where day nurseries had long been established. Reasons given for this prejudice are fear of institutional care, the stigma of charity, the strain of traveling, the exclusion of the child for a slight illness, the occasional quarantine of the nursery itself. Moreover, contrary to European practise the better nurseries in the United States have always tried to secure for very young children alternate types of care through relief from family agencies or through foster home or institutional care. Some nurseries refuse children under nine months of age, and others have a minimum of two or even three years.

It is interesting to note in this connection a procedure, undertaken in 1927 by the First Day Nursery of Philadelphia and now being contemplated by another Philadelphia nursery, which may vitally affect the future of nursery work. Because of the shift of population the First Day Nursery had become so difficult of access that

the building was sold, and instead of relocating the nursery an experiment in foster home care and placement of children in homes near those of their parents has been undertaken. The new elements in the plan are the regular service of the trained case worker and the supplementing in most cases by the nursery of the cost of board.

Failure to encourage the day nursery movement also has roots in the fear that its spread would be an added inducement for mothers to enter industry in such numbers as seriously to endanger child and family welfare and in addition to affect detrimentally wage rates for men workers and the introduction of systems of maternity insurance and pensions. This has shown itself in the discouragement in England and the United States of the factory crèche, even during the war.

Reports indicate, however, that the mother of the day nursery child is in many cases the resourceless mother without relatives, friends or husband to assist in child care or support. The largest number of children in the day nurseries of the United States today come from homes in which families have been broken by the death of one parent, by separation or desertion. A recent study by the Federation of Day Nurseries of its affiliated nurseries in New York and Philadelphia shows that of the total number of families whose children are in day nurseries 37 and 51 percent respectively come from such homes. The percentage of the total number of children is probably much higher and in one state ran as high in 1924 as 89 percent. Moreover, in only 8 cases out of 100 in that state was the wage of the father who could be called upon for support adequate to provide for the minimum wants of the family.

A more realistic attitude therefore, especially in view of the fact that not all states provide mothers' pensions or other forms of family assistance and that the adequacy of the provision varies from state to state, has led to a movement for the improvement of conditions within the day nurseries.

This movement has had several aspects. There has been an increase of legislative regulation and inspection of day nurseries, public and private; standards of equipment and personnel have been improved. The nursery has been used in experiments such as that undertaken by the Fitch Crèche in Buffalo as a training school for workers. It has also been extended in function as an educational institution for both experimental education and child guidance work. It

has been demonstrated that the extension of such functions can transform the day nursery from a mere receiving agency into an agency offering health service and other benefits to the child and his family.

The development of the nursery school movement in England, where it originated, and in the United States, although arising to meet needs of other groups, has to some extent justified the separation of mother and child for part of the day in order to group children for educational activities and has influenced the introduction of nursery school methods into some of the more advanced day nurseries. Thus, for instance, the Bethlehem Day Nursery of New York City has a progressive nursery school; a behavior clinic for mental hygiene service is provided for the nurseries of Cleveland; and in many instances the nursery and day nursery school are combined. There is still, however, a functional distinction to be made between the day nursery and the nursery school. The day nursery may embrace the nursery school but their goals are different, for even when nursery school facilities and opportunities are added, the most important factor in deciding whether to grant or withhold aid is the economic status of the family. Yet most progressive day nurseries feel that it is within their widened scope to offer to children of lower economic status the same service the nursery school extends the child of the wealthier parent, who selects the nursery school he can afford.

The connection between school and day nursery has to some extent been fostered by public school authorities, especially in Germany. In the United States, as a result of an attempt during the war to keep in school high school children who might otherwise be called upon to substitute for their mothers in child care, Los Angeles public school authorities have created day nurseries for the younger children, and thirty of the thirty-eight day nurseries in the city are financed and controlled by the public school authorities.

It is interesting to note that in the intensive child saving program carried on in Russia after 1917 the day nursery played a considerable part. In 1917 there existed 14 day nurseries in industrial neighborhoods; during the famine period these reached a peak number of 914 in 1922; in 1925, however, there were still 584 in existence. In the period from 1913 to 1923 the rate of child mortality decreased from 27 to 17 percent. The exact relationship between the day nursery movement and the lowering of the infant mor-

tality rate in any country would of course be difficult to prove.

With improvements in management, provisions for adequate regulation by public bodies and close coordination with other agencies for child care the day nursery may very well function as an effective agency for child care. Its role in any program of social welfare is interrelated, of course, with the broader problems of child welfare and of the continued industrialization of women's work.

DEADLOCK. In modern democratic governments the legislature has attained so dominant a position that the dangerous form of deadlock between it and a powerful executive rarely occurs. Deadlocks between the king and the legislature, like that in England which led to the revolution of 1648 and like those between

the king and the sovereign courts, or *parlements*, in France which hampered the administrative programs of the French royal governments, are hardly possible in a modern government where there is direct responsibility to the people on the part of both legislature and executive. Deadlocks in a popular government may occur, however, as a result of conflict between the houses in a bicameral legislature or through party differences. They may arise over the passage of laws or the voting of taxes or appropriations. While inability to pass legislation may seriously hamper the program of a government, the latter can continue to function so long as funds are available. Legislative failure to vote taxes or appropriations, however, may absolutely prevent the continued existence of the government and may lead to revolution or other violent extraconstitutional action.

A deadlock between two houses of a legislature may become very serious where the houses represent different classes of the population. An outstanding case is the Parliament of England with the hereditary House of Lords, having a permanent conservative majority, and the elective House of Commons. As the suffrage was extended the Commons became the active body in legislation reflecting public sentiment. The threat of deadlock was finally ended by establishing the supremacy of the House of Commons and leaving the Lords only the power of a delay for a certain time.

In parliamentary governments like that of France, where both chambers are elective and where the economic interests of majorities and the party composition in the two chambers may differ, there is a possibility of serious deadlock. In practise, however, party and personal responsibility to the voters acts as a check on a situation that has in it the seeds of revolution.

Deadlocks are always possible in the American Congress between the House of Representatives and the Senate. Every two years the whole House of Representatives, but only one third of the Senate, is elected, so that one party may win control of the House while the other remains in power in the Senate. The different relative influence of different geographic areas, resulting from the right of each state to have two senators while congressmen are allotted on a basis of population, may result in the predominance of different interests in the two houses. The power of the minority in the Senate to obstruct, especially by unlimited debate, legislation approved by the House forces

consideration of the minority point of view—an important safeguard in a popular government—but may lead to deadlock with the House, which is more effectively controlled by the party machinery. The Senate has at times threatened to refuse to vote all or part of the appropriation bills in order to force certain action by the dominant party in the House and by the president. One check on deadlock lies in the responsibility to the popular vote. As members of a party senators and representatives are obliged to consider the effect of persistence in a deadlock on the fortunes of their party; as individuals they are subject to the pressure of their constituents. Another check lies in the multiplicity of bills and variety of policies depending on action in Congress, so that the opportunity for compromise is very great. Furthermore, a deadlock may continue for a long period on a particular measure without interfering seriously with the working of the legislative machinery in other fields. Finally, the lack of a definite majority in Congress does not prevent the existence or continued functioning of the independent executive.

Party control lessens the danger of deadlock between two houses, but party and group are a prolific source of difficulty in each house. In the United States the loose two-party system permits the formation within the parties and frequently across the parties of more or less temporary blocs representing particular interests. Such blocs may result in deadlocks on particular measures.

Under the parliamentary form of government, where the executive is a committee of parliament, party rivalries may cause a deadlock. Under a two-party system with strict party control deadlock in a parliament disappears, since the executive ministry is also the steering committee of the parliament and can force through its legislative as well as its financial program. If it loses the confidence of the parliament it is replaced by a different party with a different program strong enough to secure the passage of finance measures and of the important legislation to which it is pledged. Should there be doubt as to which of the two parties has the confidence of the people, a new election can be called and there will normally be a majority returned which under party discipline can create an executive and carry on the government without danger of deadlock. Where, however, there are a number of parties and groups based on economic interests, polit-

ical ideals or allegiance to individuals, the parliamentary system becomes difficult to operate. In a parliamentary state the result of a party or group deadlock is not merely, as in a country like the United States, a delay in legislation. A ministry must be formed if the executive is to function. This can be done only through a grouping of parties with wide differences in their programs and personal antagonisms among their leaders. The power which this gives to parties must be counterbalanced by a strong sense of national unity which will induce the sacrifice of personal ambitions and party programs in the national interest. The consequences of continued deadlock are so grave that the pressure of public opinion will ordinarily compel some kind of a compromise which may be temporary and ineffective in securing important legislation. If the remedy applied is a dissolution of the parliament, the new chamber may be as hopelessly divided as the old. As economic questions come increasingly to the fore, enlisting the economic interests of different groups, the difficulty of forming governmental coalitions and of passing the necessary economic legislation increases.

One device for overcoming a deadlock occasioned by a multiplicity of parties is that of permitting the tax and appropriation laws to continue in effect until they are changed by parliamentary action. Thus the functioning of the government is assured. This alone is not sufficient in a modern state, particularly in Europe where the conduct of foreign affairs is of such importance. Nor does a government immobilized by internal dissension and incapable of action fit the needs of a country in sore economic stress or in which new economic or social ideals are supported by a large and active section of the population. The deadlock must be broken, a ministry with majority support formed and remedies applied. If this cannot be accomplished through the vote of the people or through compromise, the stage is set for the drastic solution through dictatorship, either constitutional, as in Germany in 1930, or extra-constitutional, as in Italy.

under which deadlocks may appear can be seen in Lees-Smith, H. B., *Second Chambers in Theory and Practice* (London 1923); Rogers, Lindsay, *The American Senate* (New York 1926); Hasbrouck, Paul De Witt, *Party Government in the House of Representatives* (New York 1927).

DEAF. The term deaf is applied indiscriminately to three groups in the population: those who are entirely without sound perception; those who are partially deaf; and those who are deaf mutes, that is, who not only are unable to hear but also lack normal speech. Deafness in the last sense is comparatively rare. Devices for testing and measuring auditory power reveal that most of those who are known as deaf and even the majority of deaf mutes have a certain degree of undeveloped hearing.

Deafness and mutism are quite distinct. No anatomical connection exists between the organs of hearing and those of speech. Lack of speech results from lack of hearing because without hearing one cannot learn to speak unless specially taught and cannot distinguish voice modulations and inflections. A deaf mute is thus one who was born without hearing or has lost it at an early age and who therefore has not acquired speech. The later the age at which such an individual has lost his hearing the better will be his speech. Persons unable to speak despite the possession of hearing are very rare, their condition being due in nearly all cases to some mental or nervous disorder.

There has been but limited research upon the subject of the cause of deafness and little accurate knowledge is available. From one third to two fifths of the deafness of deaf mutes is congenital; from three fifths to two thirds is acquired, usually, from some disease of infancy or early childhood which affects the middle ear or the internal ear. About 17 percent of acquired deafness is caused by meningitis and 17.6 percent by scarlet fever. Measles, typhoid fever, whooping cough, diphtheria, pneumonia, catarrh and inflammations in some part of the auditory apparatus sometimes result in deafness. Some deafness is of hereditary origin, either directly or indirectly, although little is known of the exact extent or nature of hereditary deafness. Inter-marriage of the deaf does not play a large part in deaf mutism, probably because as a rule each parent suffers deafness from a different pathological condition. Much deafness can be prevented through general measures for the protection of the health and for the improvement of living conditions. The immediate prac-

tical program is the arrest and control of diseases in infancy and childhood, especially communicable diseases which leave deafness in their wake, and the education of the deaf in speech and lip reading. The hard of hearing, although still frequently exploited by quacks, are being increasingly aided by perfected mechanical appliances.

There has been little investigation in any country of the total number of persons wholly or partially deaf or with impaired hearing. In the United States the conservative estimate for deaf mutes is about 53,000. Deaf mutism is relatively more frequent among males than among females. In the population at large there are 104 males to every 100 females; the ratio of male deaf mutes is about 121.

In most ancient civilizations the deaf were regarded as abnormal and mentally defective. They were exposed to death in Greece and survivors received no special care or protection. In Rome, however, deaf mutes were granted definite rights as citizens and care was provided for those in special need. In the countries of Europe adopting the civil law, especially France, the rights of deaf mutes were respected but their physical disqualifications kept them from meeting certain legal formalities. In England under the common law the early status of deaf mutes was very low. According to the dictum of Blackstone it was a presumption of the law that they were almost idiots.

Both in the British Isles and on the continent a fundamental change in the attitude of the public toward deaf mutes appeared when it was discovered that they could be educated. The first school for the deaf was established by Charles-Michel, abbot of L'Épée, near Paris in 1755. Schools were also established about the same time by Samuel Heinicke near Hamburg and by Thomas Braidwood in Edinburgh. In 1784 a school was founded in Rome, in 1788 in Madrid and in 1801 in Genoa, followed by many others in the cities of Europe.

The first school for the education of deaf mutes in the United States was opened at Hartford, Connecticut, in 1817, and since then their spread has been rapid. At present only a few of the less populous states in the Union are without special schools for deaf children. In about half a dozen states deaf and blind children are educated in the same school, an arrangement generally regarded as undesirable. In many schools the presence of feeble-minded or mentally backward children among the deaf complicates the

problem of education. Most schools for the deaf are state institutions under the immediate direction of a special board of trustees or a state board. A few schools in the East are private institutions, partially endowed but depending largely upon state per capita appropriations or subsidies. In addition to the state institutions day schools for the deaf have been established as parts of local educational systems, often operating under special state laws. With the pupils residing in their own homes a normal order of living is provided. Gallaudet College, located at Washington, D. C., and maintained entirely by the federal government, is a special institution for the higher education of the deaf. Within recent years, largely in consequence of similar work for children with defective eyesight, special classes have been organized for children with defective hearing in the schools of the larger cities. Ear clinics are being established in connection with such classes.

In Europe the oral method has been the prevailing one used, formal adherence to this method having been established at an international convention of the instructors of the deaf at Milan in 1880. There has been far less direct recognition of the sign language than in the United States. In the most advanced European schools for the deaf increasing attention is being given to the possibilities of acoustic instruction and to vocational training, but the physical facilities for the latter are generally inferior in extent and efficiency to those in the United States. Both special institutions and day schools for the deaf are now found, with an evident trend toward the latter, and classes for the hard of hearing are being established on a wider scale. Compulsory education laws are being extended to the deaf. In some countries education of the deaf is not considered a function of the state, although the trend is distinctly in that direction. Private schools, found more frequently in southern than in northern Europe, usually under the control of some religious body, are often subsidized by the state. Little organized provision is made for higher education of the deaf in Europe. The deaf have not achieved the social and economic position of the deaf in the United States but have been regarded to a greater degree as charity dependents.

As a result of their education the legal limitations and disqualifications against the deaf have gradually disappeared. Apart from the provision for schools legislative action has taken but occasional notice of the deaf whether in measures

of material assistance, protection or discrimination. In judicial proceedings the tendency has been to put deaf mutes on an equal footing with others. They are now generally held quite responsible for their criminal misdeeds. They are qualified as witnesses if proper interpreters are available and are capable of making wills and of entering into contracts. In the economic sphere the differences between deaf mutes and the general population are minor as compared with the status of the blind. While their handicap is a barrier to their entry into certain commercial and professional fields, there are a variety of other semiskilled industrial positions where deafness does not act as a drawback. Provision is generally made for occupational training in the special schools for the deaf.

The deaf suffer as a result of their social cleavage from the rest of their fellow men, but they compensate for this by close association among themselves. They form their own societies and organizations and communicate by the sign language and by finger spelling or by a combination of the two. The sign language consists of both natural and arbitrary signs and embraces pantomime and many expressive gestures, all of which become codified for the experienced user. Finger spelling is reserved for uncommon words. Some of the deaf employ speech and lip reading, which they have been taught in their schools, but with many this method of communication proves unsatisfactory. Writing is resorted to when other methods are not available. In most of the schools both the sign language and speech with lip reading are being taught. In certain schools no other methods of communication except speech and lip reading are permitted. The auricular method, by which the residual powers of the ear are brought into use, is being increasingly used in schools and is likely to become an important factor in the education of the deaf.

As compared with the blind and cripples there have been relatively few organizations created for the benefit of deaf mutes apart from the activities of certain religious bodies and an occasional measure by some social welfare agency. Leagues for the hard of hearing are being organized whose chief purpose is the instruction of adults in speech and lip reading, and which sometimes provide in addition certain forms of social welfare work, such as special employment service. It is generally recognized, however, that there is a close connection between the social and economic status of the deaf and their degree of education and that the problem of creating

normal relationships and independence for deaf individuals is chiefly a problem of overcoming their educational handicap.

DEÁK, FERENCZ (1803-76), Hungarian statesman. Both in the formulation of a reform program and in the struggle with Austria Deák was an outstanding leader of Hungarian moderate liberalism. Shortly after his election to the national Diet in 1833 Deák led the liberal opposition in its reform measures of toleration for Protestants and Jews, improvement of the lot of the peasants and abolition of the exemption from taxation of his own class, the landowning magnates and gentry. The intensity of counter-agitation aroused by certain phases of his program led him to refuse his seat in the Diet, to which he was unanimously elected in 1843 and 1844, but in 1848 he accepted the post of minister of justice. His draft of a modern criminal code, which provided for the abolition of capital punishment, won him considerable international repute. After the compromise of 1867 Deák devoted himself again to the cause of religious tolerance, and in 1873 he wrote at length in support of the separation of church and state. His speeches have been collected and edited by M. Kónyi (6 vols., Budapest 1882-1903), but neither these nor his "A contribution to Hungarian public law" (Pest 1865) have been translated.

His most outstanding contribution was, however, as mediator in the contest with Austria prior to, during and after the Revolution of 1848. His program of resistance to Austrian aggression on constitutional rights was, like that of Eötvös, far less radical than the demands of Kossuth. Nevertheless, in the Diet of 1839-40 Deák led the fight for amnesty for Kossuth. After the failure of conciliatory methods and the suppression of the Revolution of 1848 Deák, who had been court martialed but acquitted, retired from public office. During the entire period of repression he continued his agitation for constitutional liberty, refusing to accept defeat as permanent but opposing the radical plans for a second revolution. In 1860 after the disastrous war with Italy Francis Joseph sought to placate Hungarian discontent by a promise of constitutional liberty and Deák was chosen by the Hungarian Diet—in spite of the opposition of its majority to his radical policy—to frame the address to the emperor. He proposed as basic measures the restoration of the constitution of 1848 and the creation of an independent ministry. The effort failed and the Diet was dissolved. Nevertheless, in 1865, when Austrian defeat by Prussia and Italy led to renewed efforts for peace with Hungary, Deák at the risk of his popularity advised against exploitation by Hungary of Austria's weakened condition, counseled the development of reciprocal good will and encouraged the resumption of negotiations on the theory that in such controversies it was the sovereign who acted as protector of the people and often blocked infringement by his own ministers on constitutional liberty. The compromise of 1867 embodied substantially the program Deák had drafted in 1861. Although he declined to accept the post of prime minister as a mark of recognition for his services in behalf of peace Deák continued until his death to exercise considerable influence on the policy of his country and of the Austrian empire.

HENRY MARCZALI

Consult: Csengery, A., *Ferencz Deák* (Budapest 1877), German translation (Leipsic 1877); Laveleye, E. de, "Ferencz Deák" in *La Prusse et l'Autriche depuis Sadowa*, 2 vols. (Paris 1870); Arnold-Forster, F. M., *Francis Deák* (London 1880); Wlassics, G., *Ferencz Deák* (Budapest 1923).

DEAKIN, ALFRED (1856-1919), Australian statesman. He entered the Parliament of Victoria in 1880. As a Victorian minister from 1883 to 1890 he brought about the first Australian irrigation and factory legislation. Through-

out the nineties he refused office, worked for Australian federation and virtually carried Victoria into the commonwealth. He became the first commonwealth attorney general in 1901 and was thrice prime minister, in 1903-04, 1905-08 and 1909-10.

In essentials Australia's settled policy today goes back to the Liberal party under his leadership. In British politics Liberalism connotes *laissez faire*. Australia's Liberalism has a tradition of protective tariffs and paternal government—*socialisme sans doctrine*. Such was the Liberalism of Deakin. Until his retirement from the commonwealth Parliament in 1913 there were few essential matters on which Liberal policy differed from that of Labour. His ideal Australia was a white Australia, developed by state assisted British immigration, guaranteeing by law "fair and reasonable labor conditions" and protected by tariffs from underpaid labor overseas. These have become Australia's settled policy. In external affairs Deakin was both a sturdy nationalist and an ardent imperialist. Australia was to be a free nation (defended by a citizen army and an Australian unit in the imperial navy) within an empire whose unity should be institutionally organized and cemented by preferential trade. Imperial federation apart, this is Australia's spirit still. However regarded, Deakin is the central figure in the political history of the Commonwealth of Australia.

Deakin did not actually originate all the policy which he advocated; he brought to Parliament not so much the gifts of the political inventor as the eager receptive mind, constructive grasp and moral earnestness of the prophet. He brought also magical eloquence and a personal charm which held ministry after ministry.

K. H. BAILEY

Consult: Murdoch, Walter, *Alfred Deakin: a Sketch* (London 1923).

DEATH CUSTOMS are generally supposed to have their roots in the emotions, especially dread. Savages, among whom death customs are generally more elaborate than among the highly civilized peoples, are alleged to feel an overwhelming fear of death which prompts measures for self-protection. This is not confirmed by observation. Savages live and die publicly, so that the sight of death is often familiar from childhood. In the more civilized groups death is hidden. Contact with it is much rarer and for that reason gives a greater shock;

it is their greater horror of it that makes them keep it out of sight.

Attempts to derive death customs from affection and sorrow are open to similar objections. Death ceremonies may provide an outlet for emotions, but they may tend to renew the pain. People who feel most are usually the most averse to elaborate ceremonial. They can scarcely endure much of the ritual prescribed by the traditions of many non-European peoples or even European peasantry, for instance, buffoonery, obscenity, merrymaking and intoxication. Even the lamentations cannot be entirely explained by grief, since it has often been observed that they begin and end abruptly at the moment prescribed by custom. All rituals provide some sort of outlet for the emotions. What is common to all cannot explain any particular one or its many variations and opposite effects. Nor does it follow because a custom has a beneficial mental effect that it was designed for that effect.

We cannot hope in our present state of knowledge to determine the origins of death customs, but we can make some progress toward that end if we analyze the various conceptions of death and the structure of the death rituals as an expression of those conceptions.

All peoples are tacitly assumed to have the same conception of death. But Rivers in his *The Primitive Conception of Death* pointed out that different races classify differently, that the Melanesians draw the line not as we do between life and death but between healthy life on one side, illness and death on the other. Their word *mate* covers illness and death; the converse of *mate* is healthy, vigorous. Rivers generalizing assumed this to be a phase in the evolution of thought. It is really the product of a school of thought which has spread from an unknown center to include such "advanced" peoples as the Indians. In Vedic literature the antithesis is between *amrita* and death. *Amrita*, usually translated immortality, is really a hale and long life, freedom from disease, accidents and the assaults of enemies; it is opposed to death, old age and illness and so does not materially differ from the Melanesian idea of life.

Owing to the lack of inquiries in other areas the distribution of this conception remains unknown. We know that a considerable portion of the world regards death not as a crisis but as a process which begins with illness and merely culminates in what we know as death. Furthermore, this process is one of rebirth. One of the clearest statements is found in sub-Vedic liter-

ature. "A man is born three times. At the beginning he is born of his mother and father. Then when he to whom the sacrifice inclines performs a sacrifice this is his second birth. Then when he dies, when they put him in the fire; in so far as he comes into existence thence, that is his third birth." The idea occurs as far apart in time and space as in ancient Egypt, Peru and among the Hottentots. It suggests an explanation for the common custom of burying with knees drawn up in what is called the embryo position, a custom at least as old as the Cro-Magnon race.

Wherever this theory has penetrated, the death customs show a distinct resemblance to those of birth. We do not know as yet whether it has penetrated everywhere and whether all death ritual has the same origin, but a whole family of death rituals is based upon it and has spread very extensively. The following remarks apply only to that family. Lustration and bathing are common to birth and death. It is not clear whether their use at birth is purely utilitarian or based on the life giving properties of water. The corpse is still washed in western Europe. It cannot be from motives of cleanliness, since the deceased may have been washed that morning; it can only be ceremonial. Unction with oil is also common to both birth and death although less constant. The deceased is clad in clean garments, but this is not imitated from clothing after birth, since in warm climates children are often not clothed until puberty. Watching at night, jesting and rejoicing are also common to birth and death. The baby receives its first name, the deceased a new one.

We must keep in mind that real birth is physical, while death is a rebirth only spiritually. The two cannot therefore have many ceremonies in common since the ceremonies are imitations of physical processes. Thus the child comes forth from the real triple membranes of the womb; for the dead it is necessary to symbolize the womb by means of garments. Moreover, the whole object of rebirth is to provide the grown up with qualities that were lacking at birth. Birth ceremonies usher in life without thought or sexual power; initiation ushers in the mental efflorescence; subsequent consecrations raise it to a higher potential, death ceremonies being the last. The greatest ceremonial analogy is therefore to be expected between death customs and the sacraments or consecrations that begin usually about puberty. In Egypt, Moret says, "the dead man is consecrated king by funeral rites which

are identical with those which make of Pharaoh a god in his life-time." The dead man in Egypt is conceived as a god. Fijians say that at a funeral everything is done in chiefly style because the dead are chiefs. The dead are universally treated as of higher rank than the living.

The analogies between death customs and consecration ceremonies are striking. The fact that fasting usually precedes initiation and coronation may explain why in many cases no feast is held for a few days after death: the feast is an offering of which the dead partakes; delay is equivalent to fasting. Similarly, ordeals commonly precede initiation and coronation; the dead body cannot undergo them but the soul can. This is very explicit in Egypt but is common to most eschatologies, including the Christian and Mohammedan. The ordeals are reflected in the customs: the living assist the soul by speaking formulae or writing them down for interment (the Egyptian *Book of the Dead* is a good example) or by placing with the body some object which is required for the test. A ritual object may symbolize the real instrument: in India the altar is regarded as the scale in which the sacrificer's good deeds are weighed in his lifetime, so that he escapes being weighed after death. The initiate and the king both have to win a ceremonial victory. The *Book of the Dead* harps on the idea of victory; one chapter was recited while the priest laid a beautiful crown of victory upon the brow of the deceased. The rejoicings that follow death after an interval are probably rejoicings at victory. Death as a contest ending in victory has descended to the Christian ritual through St. Paul: "Death is swallowed up in victory. O death, where is thy sting? O grave, where is thy victory?" It has here received an ethical significance, but in primitive rites it gives access to higher magical powers. The period of quiescence which precedes consecration ceremonies is copied from the quiescence before birth and after death. "It was an ancient custom in the funerals as well as the triumphs of the Romans," says Gibbon, "that the voice of praise should be corrected by that of satire and ridicule." Jestings as a death custom is recorded in German mythology and at present is found as far apart as Fiji and the Cameroons. It often takes an obscene turn, a feature of consecration ceremonies such as the horse sacrifice in India. These obscenities indicate a sexual element which is present in all primitive sacraments and generally sublimated in later forms but is especially prominent in initiation ceremonies. The

clothing of the dead is analogous to the robing of an initiate or king, since the clothes are those of state: the dead chief is commonly invested with the regalia. Where the regalia are a national palladium they cannot be buried but must be preserved as a national treasure. The soul does not, however, require the actual object but only its shadow, and this can be supplied by imitations like the Chinese paper money burnt at funerals or even by mere formulae. Thus the Egyptian formulae make the deceased "crowned king of the gods" and prevent his throne being taken away from him. Popular ideas of heaven in Europe still include crowns and thrones of gold. The altar, the throne and the tumulus are often indistinguishable. Like the initiate and the new king the deceased often receives a new name. The queen is invariably consecrated with the king. This explains the custom of suttee, or immolation of the wife at the husband's funeral. Suttee is not peculiar to India. A rule common to Greece, Rome, India and other regions does not allow a man to be consecrated without a mate. Since death ceremonies are the final consecration, the wife must go through them with her husband. At the coronation the vassals or court officials are installed along with the king. Discoveries at Ur show to what lengths this principle was applied at the death consecration. Such ruthless holocausts have for obvious reasons not found as much favor as suttee. The suicides that still follow the death of an emperor of Japan are probably survivals. It is possible that man hunting and head hunting have arisen out of this custom through the substitution of strangers for fellow citizens.

As a rule the wife and the mourners die not physically but spiritually. Thus in the *Rigveda* the wife lies down beside the corpse on the pyre but is led away by the deceased's brother. It is only later that suttee becomes rigorously enforced among all the better classes. In the Solomon Islands suttee is confined to the chief's wives; the widow of a commoner undergoes a fictitious death, being confined out of sight for a time, sometimes with knees drawn up like a dead man in the embryo position. Many of the observances of mourners are to be explained after the manner of suttee. This is clearly shown in Fiji by the use of the word *iloloku*. A widow who undergoes suttee, a man killed at a chief's death, mats placed in the grave, boys circumcised at the same time as the chief's son, are all *iloloku*. In these cases the word means some person or thing that undergoes the same rites as

the principal. A mitigation of the *iloloku* is practised in cases where people lie down during the period of mourning or a finger is amputated at the death of a chief. It is as *iloloku* that all the little children put on clothes for the first time at the death of a chief. It is clear that the Fijian mind associates the clothing of the dead with a boy's first assumption of clothes. Sexual abstinence is common both as a funeral practise and as a prelude to initiation. The fictitious death of mourners may explain *I Corinthians* xv: 29, "Else what shall they do which are baptized for the dead, if the dead rise not at all? Why are they then baptized for the dead?" Evidently the baptism of kinsmen was supposed to help the dead to resurrection by the identification of the living with the dead.

The living undergo the same rite as the dead but with a difference. The deceased is clad in all his finery, but the mourners wear tattered or dark colored clothes and eschew ornaments. The wife who commits suttee is elaborately dressed, but the widow who survives must be shabby. Thus another idea comes in to modify the basic one of imitation: the death ritual raises the dead to a higher rank than all the preceding consecrations; therefore the living humble themselves before him as vassals before the king.

The gradation of sacraments explains apotheosis, or deification, after death. The king is divine in his lifetime but not to the highest possible degree. The consecration at death makes him completely one with the god. This is also true of saints, especially in India. There the individual soul, prepared by a long course of austerities, becomes absorbed in the universal soul. A kind of pantheism results.

In apotheosis the deceased is supposed not to die but to be translated. Thus the image of a Roman emperor was treated as if he were asleep not dead. Both in South India and Fiji a chief is said to sleep not to die. The distinction between dying and extinction which is not death is puzzling. In India it is expressed thus: "For men they slay the victim on the frontal bone. . . . For gods they choke or strangle it, and say, not, 'Slay, kill it,' after the human manner, but 'Quiet it. It has passed away.' For when he says, 'It has passed away,' then the sacrificer passes away to the gods." In interpreting this it must be remembered that the victim and the sacrificer are identified. Of an Egyptian king it is said, the sun god "has not given him to Osiris. He has not died the death. He has become a great and glorious one on the horizon." Such texts evi-

dently use the word death in a much narrower sense than the modern western world; by it they mean a way of dying which leads to the underworld as opposed to another way which translates to the world of the gods in heaven or even to the sun disk. The antithesis is so strong in India that Yama, who might be called the god of death, is not there regarded as a god because he died and gods do not die. On the other hand, the Buddha, although a man according to western notions, does not die but passes away, "sees Nirvana," that is, extinction. The antithesis between Nirvana, the fruit of enlightenment, and death, the ever recurring fate of the unenlightened, is one of the cardinal doctrines of Buddhism. The idea of extinction as opposed to death is doubtless obscure because it is based on some practise that disappeared before the beginning of the records. This practise was possibly the bloodless putting to death of the king before he could die of sickness or old age. This was not accounted death. This suggestion is borne out by a south Indian myth of "an age when men did not die, but simply dwindled, from sheer age, until it became necessary to get rid of them by shutting them up" in stone lined graves with food, water and light (Cammiade, L. A., in *Man*, vol. xxx, 1930, p. 187-89).

Methods of disposing of the corpse have called forth a variety of explanations. A desire to get rid of it is generally accounted a sufficient reason for simple interment. It is not a sufficient reason, for the simplest method of disposal is to leave the body to rot. Modern western squeamishness must not be attributed to other groups. Many are content to let animal carcasses rot in frequented places rather than take the trouble to remove them. True, the sight of a human corpse is not merely repulsive but distressing; but the dwellers in a sparsely populated country can easily remove the corpse to an unfrequented spot, as some tribes are still content to do. Interment was practised as early as palaeolithic times, and there could be no question then of a dense population. One possible reason for interment is an idea we know to have existed from very early times, that of planting the body in the earth like a seed for rebirth. In India the site of the tumulus "is ploughed with six oxen after a prayer, 'May Savitri grant thy bones a place in the earth.' Seeds representing all herbs are sown, then the cremated bones are poured out with the prayer, 'Savitri strews thy flesh in the lap of thy mother the earth.' " Savitri is a

sun god: thus the sun sows the flesh of the deceased as a seed in the womb of the earth. The idea is used by St. Paul: "So also is the resurrection of the dead. . . . It is sown a natural body, it is raised a spiritual body." Basing his sermon on this passage a modern preacher says, "The Church sprinkles the dead body with holy water. She censes it because it was the organ of expression, and is the seed of the spiritual body which we shall wear hereafter." He then proceeds to refute scientific objections by showing how the green stalk grows out of the little brown seed. In the Vedic passage just quoted the idea of seed is coupled with that of the earth as mother and the grave is the womb. It is impossible as yet to say whether these two conceptions represent two independent streams of thought that have coalesced. The womb idea by itself would account for the embryo position.

It may be the same idea of planting the body in the earth that prompted the custom of dismembering the corpse for burial. Just as the ear of corn is broken up to sow, so the body is broken up before being committed to the earth, a practise which existed in prehistoric Egypt. There are abundant memories of it in Indian ritual. Myths relating how the world was created out of a dismembered human victim are found all the way from Germany to the Gilbert Islands at least.

Cave burial seems at first sight to require no explanation: men lived in caves, therefore nothing seems more natural than digging a hole in the floor to stow away the body or than continuing the practise after cave dwelling was given up. This hypothesis, however, does not explain why in some cases, for instance in Fiji, cave burial was the privilege of chiefs nor why so much labor was incurred in excavating caves where natural ones were lacking. Furthermore, as early as palaeolithic times the innermost recesses of caves most difficult of access and unsuitable as habitations had their walls painted with figures which to the minds of archaeologists were not a mere exercise of the aesthetic faculty. The use of caves for burial seems therefore to be derived from their religious associations rather than the other way around.

Long barrows would appear to be imitation mountains with caverns inside. They cannot be explained on grounds which moderns would consider utilitarian, as a mere method of disposing of the body, since they involve a labor far in excess of what is needed for that purpose. The reason for them may be known when the

beliefs that are now associated with long barrows in the countries where they are still piled up and the legends centering around the prehistoric ones are collected. A new set of ideas came in with the bronze age to alter the shape of the barrow to a circle. Round barrows still survive in Buddhist countries as shrines containing the cremated relics of the Buddha. In Ceylon they were built to receive the ashes of kings and are still built for priests. Stone or brick has taken the place of earth. The Sanskrit term is *stupa*, corrupted in Hindustani to *tope*. Round barrows belong to eastern India. Western India favored the square shape on the ground that the round one does not distinguish the four cardinal points. The Indian evidently regards the square and the round barrows as merely variations of the same thing: the function is essential, the form a matter of opinion. We are thus justified in assimilating the pyramid to the genus barrow. All three forms, long, round and square, still occur in some places side by side.

Bas-reliefs of Indian topes show that these originally carried a small shrine. Evidence from other countries points the same way. The Indian tope represents the universe: the top surface is the sky, the ground the earth and the intervening space the atmosphere; the square masonry on the top of the dome is adorned with the disks of the sun and moon, and the drum of the pinnacle above is called the rampart of the gods. The relative positions in Buddhist cosmogony are thus reproduced in the tope. The Persians placed a similar construction on their cave temples. In this connection it is significant that the Latin *mundus* means both the world and an underground shrine. The tumulus or the shrine must then have been regarded as an epitome of the universe from very ancient times. The idea survives in Europe as an artistic device: domes are commonly painted inside with scenes of heaven and occasionally studded outside with stars.

Elliot Smith places the original home of mummification in Egypt. Nowhere did climatic conditions so favor attempts to insure continued existence after death by preserving the flesh as well as the bones, and nowhere was the technique so highly developed. He supports his theory by pointing to cases of imperfect mummification in other lands and of purposeless technique which can only be explained as misunderstandings of a complete and purposeful mummification as practised in Egypt. Most significant are the cases in which some sort of embalmment is followed by cremation, an addition

which takes away the whole point of the original process (see Levin, Mary, in *Man*, vol. xxx, 1930, p. 29-34, 44-48, 64-66).

Such cases further disprove the idea that cremation is merely a convenient way of disposing of the corpse; instead of simplifying the procedure it complicates it, for it is often followed by interment. Its origin must lie then not in convenience but in ideas concerning the properties of fire. As yet only the lines of inquiry can be suggested. Fire is believed to be latent in trees (among the Turks, Indians, Polynesians and others), stones and even in water. It is present underneath the earth; the sun and stars are heavenly fires. The wide distribution of these ideas shows that the pervasive nature of fire was recognized at a remote period. Fire is immaterial. These properties make it a very convenient vehicle for the immaterial essence of things. A Solomon Islander says, "If you destroy the offering in the fire the spirit can eat it. Just as a man when he rots goes to the land of spirits, even so if you destroy a little pudding the spirit in the land of spirits can eat it." Compare the Vedic address to the body on the pyre: "Let the eye go to the sun, the breath to the air. Go to the sky and to the earth according to fitness; go to the waters. If it is pleasing to thee, there abide in plants with thy limbs." Matters are here complicated by the idea of man as a microcosm: fire conveys each part to the corresponding part of the universe. The precremation practise of dismemberment seems to have left traces here.

Cremation and burnt offerings have the same roots. They go together in Greece, Rome and elsewhere, but we often find cremation combined with unburnt offerings and natural putrefaction with burnt offerings. In such cases it is sometimes possible to prove that two different traditions have been fused owing to the interaction of two cultures or two classes of society. For cremation is not always common to all ranks but seems to have been originally aristocratic, as it is still in India (in Ceylon only kings and priests are cremated). Cremation has recently gained ground in Europe under classical influence, but the offerings remain unchanged, hence the inconsistency.

Rarer methods of disposal include throwing the body into the sea, eating it, removing the flesh from the bones, leaving it for animals to devour. This last was no doubt the original method, but not every occurrence of it must be mistaken for a survival from the most primitive ages. The Parsees have substituted it for crema-

tion, a custom which, it is shown by comparative evidence, their forbears have practised.

Not all death customs can be derived from rebirth. Inversion, one of the commonest features, cannot as yet be linked up with it. It takes all kinds of forms, not all found always together: returning in inverse order from the burial ground, wearing the Brahmanic thread on the left instead of the right side, "backward speech," inverting weapons and the like. The living are by inversion imitating the dead, among whom everything is inverted: our day is their night, black men become brown and brown men black. This inversion is limited to the underworld. Thus Indians walk clockwise round the shrine of those who have not died, viz. the gods and the Buddha; but counterclockwise round the pyre of those who go to the underworld. It seems that under the earth everything is upside down.

Many death customs are due to the supernatural powers of the spirits. Consecration ceremonies bestow supernatural powers; death rites being the highest confer them in greatest measure. Further, they set free the immaterial part of man completely and thus enable it to act at a distance without visible contact, which is the essence of magic. In many religions this power is enhanced by identification with heavenly bodies, especially the sun, the source of life. It is disputed when the dead were first connected with the sun, but it is older than our earliest records, since Osiris, the Egyptian king of the dead, is solar. Yama, his Indian counterpart, is the son of the sun god. The sun and death are associated, sometimes identified, doubtless because the sun yearly grows faint.

Offerings are made in order to maintain the dead in vigor and friendliness. The Egyptians went further than any other people in filling their tombs with all the objects or models of objects which a man requires in his lifetime. The climate facilitated this tendency as it did mummification.

Fear of harm inspires devices for driving out ghosts: making a noise, hurling stones, kindling fires, burying in earth instead of merely exposing and so on. This is especially the case with evil ghosts, e.g. women deceased in travail, who are widely considered dangerous. Various devices are used to prevent the ghost from returning, such as carrying out the body foremost with toes tied, carrying to the other side of a river, blazing a false trail near the grave, tying a clog to the foot. The custom of burying suicides at

crossroads was possibly designed to mislead the ghost, who does not know which way to turn. Many of these customs assume incredible stupidity in the ghost. The reason for this stupidity is not known, but it has descended to the devil, who often takes the place of the earlier ghosts.

Death customs in their earliest known forms are designed to be useful in the narrow sense of the term; for instance, they influence the food supply by increasing the potency of the ghosts and by directing this into channels which will promote life and wealth. Some of these practises turn out to have some psychological value as well. They arouse emotions which tend to transform the customs. There is a continual conflict going on between the reasoned necessities of society and the personal emotions of the relatives. A sensitive soul is compelled to endure buffoonery and obscenity because the tribe holds it to be necessary to the welfare of all. If public opinion weakens because the utility of the custom has been disproved, then the private emotions see their opportunity to tone down and finally abolish what offends. It is painful to a parent to see his suicide son buried in unconsecrated ground. Society insists that for the public good the necessary measures shall be taken against a maleficent ghost, but when increasing knowledge discredits the old idea affection is able to gain ground inch by inch. We see the conflict going on in the burial scene of *Hamlet*. It has not ceased altogether, although affection has practically won the day by recourse to the fiction of temporary insanity. Verdicts of *felo de se* have become exceedingly rare. This is merely one example of a process that has completely remodeled the death customs of Europe, divesting them of almost everything that has not a psychological value.

This value is twofold. The rites are in harmony with the mourner's frame of mind; for instance, dark colors are congenial. Secondly, they give scope for activity—nothing is more dangerous to a lacerated mind than the feeling of impotence. Washing, originally inspired by eschatological ideas, has been retained as a last performance of a daily service. Offerings, once thought to be useful, have become a continuation of those acts of generosity that brought pleasure during life. Outward signs of mourning also act as a protection: they are a warning to others to avoid anything that may hurt. In small communities where everyone knows everyone else this is not as important as in large communities where the mourner constantly meets those

who do not know the news of the death. Observances also satisfy public opinion as to the presence of grief. The sincerest grief is not insensitive to public approval or censure. This tends to elaborate death customs, but this tendency is counteracted among peoples of greater sensitiveness and introvert disposition by an aversion to much outward display. In ages of great emotional development, like the present, quiet funerals accord better with the mood.

DEBATE, PARLIAMENTARY. Debate has been historically and is still theoretically a determinant of legislative action. Only through discussion and the expression of opinion by rank and file as well as by leaders can a legislative assembly secure the necessary information, isolate issues, determine the "sense" of the body and proceed to an intelligent decision.

Freedom of parliamentary debate was of great importance in the evolution of representative government. The House of Commons struggled for a long time before it finally secured satisfactory safeguards. The Bill of Rights, for example, declared "That the freedom of speech, and debates or proceedings in Parliament, ought not to be impeached or questioned in any court or place out of Parliament." The office of speaker was finally created because debate was not free and the Commons wished to have an official who would be able to present their grievances to the crown.

As representative government developed, however, assemblies were forced to create safeguards against their own members rather than against kings. Necessary regulation of debate has been secured by formal rules of procedure and by customary usages. Members participating in debate must receive recognition from the speaker or from the presiding officer and must address themselves to him and not to fellow members. On almost all questions more orators wish to speak than can be heard in the time available; the power of recognition which the speaker usually enjoys may consequently be of considerable importance at times. In the House of Commons a new member always has first rights for his "maiden speech." For important debates the speaker usually has lists of those who wish to speak on both sides and preference is given to ministers and ex-ministers. In the House of Representatives the number of hours for debate is usually fixed in advance. The time is then divided between, and parceled out by, the chairman and the ranking minority member of the committee having the measure in charge. The ability of individual speakers to limit their own speeches is not relied upon as it is in Great Britain. In France the rules give preference to ministers, reporters of the parliamentary commissions and orators mandated by the political groups of the chamber.

Most standing orders stipulate that debate must be germane to the pending subject, that personalities must be avoided and that motives may not be questioned. When language used

in debate is alleged to violate the rules, the presiding officer may intervene or the words objected to may be "taken down" by the clerk and repeated to the House, which decides whether they are offensive. Lord Balfour once declared that in parliamentary debate the opponents beat each other over the head with torrents of words, resulting in a maximum of noise and a minimum of damage. It occasionally happens, however, that the verbal quarrel fails to satisfy the participants, that *avouirdupois* is substituted for argument and that Marquis of Queensberry rules would be an appropriate addition to the ordinary procedural regulations.

As a factor in influencing the decisions of legislative bodies parliamentary debate has during the last half century been of rapidly dwindling importance. This is true whether the business in hand is a pending bill or criticism and dismissal of the ministry. In cabinet systems the continuous duel between executive and legislature makes debate more important than it can be under other forms. But as government has had to reach out into the economic field, legislative business has become so complex and technical that all debate is necessarily less informing and influential. In the United States the system of standing legislative committees makes debate in the House of Representatives extremely unreal. In England also the grand committees have contributed to the lowering of the level of debates in the House of Commons. Even when debate is still informing and interesting, votes are rarely influenced thereby. The increasing power of party organizations determines the opinions of legislators long before debate begins. Many members, to paraphrase W. S. Gilbert, vote at their party's beck and call and never think of thinking for themselves at all. Even where there is a good deal of non-partisan voting, as in the United States Congress, debate has but a shadow of its former importance in influencing the result. Local situations, the wishes of constituents and the personal convictions of the representative or senator are more influential than what may be said on the floor. In the Chamber of Deputies, on the other hand, eloquence can on occasion be highly important in determining the fate of a ministry. The reason for this is that many deputies of the center groups are always teetering between support of or opposition to the ministry. Frequently they cannot decide which way to fall and abstain from voting. When there is such an absence of conviction and when a

handful of votes is important, eloquence may have more immediate and far reaching results than in other assemblies.

For all major legislatures complete publicity prevails and full stenographic records of what is said in debate are available. One or two secret sessions of the Chamber of Deputies and of the House of Commons were held during the war but the experiment did not prove to be a happy one.

The growth of a cheap press and of other means of communicating intelligence has helped to decrease the importance of parliamentary debate. There is much less education of the nation by the legislature. Newspapers pay less and less attention to legislative proceedings; they are interested in drama and not in debate. Public sessions with the fourth estate in attendance, however, mean that a speaker can address a nation as well as his fellow members of the legislative body. Frequently therefore he is inclined to think more of the effect of his speech on his constituents than on his immediate audience. Sooner or later legislative debates will be broadcast. Politics is in such a state of flux and parliamentary tempers are so mercurial that any prophecy as to the effect of broadcasting upon debate is likely to be far wide of the mark. In part the tendency may be for broadcasted debates to be more decorous and businesslike in order to make a favorable impression on the country. On the other hand, many orators will undoubtedly ignore their immediate hearers and speak only to their "great unseen audience." The printing press, the telegraph, the complexity of governmental business and the power of party organizations have combined in robbing parliamentary debate of its former interest and importance. The radio may be another thief or may serve as a returner of stolen goods.

(New York 1921); Barthou, L., *La politique* (Paris 1923); Rogers, L., *The American Senate* (New York 1926); Ilbert, C., "Secret Sitzings of the House of Commons" in *Political Science Quarterly*, vol. xxxii (1917) 28-35.

DEBENTURES. The term debenture is commonly used in Great Britain to designate all classes of certificates or written instruments is-

sued under seal and evidencing indebtedness of companies (i.e. corporations). Its English use is thus largely equivalent to the word bond in the United States, where debenture is ordinarily restricted to certificates of corporate obligations having no special security such as mortgage, lien or assignment of property. The common British expression, debenture stock, designates "borrowed capital consolidated into one mass for the sake of convenience" (see Lindley, N. L., *A Treatise on the Law of Companies*, 2 vols., 6th ed. London 1902, vol. i, p. 346) and partakes somewhat of the nature of preferred stock. A similar usage sometimes occurs in America and Canada, as in General Motors Corporation 6 percent cumulative debenture stock and Canadian Pacific Railway 4 percent irredeemable consolidated debenture stock. Debenture is rarely used in connection with governmental or individual indebtedness, although the first mortgage bonds against German industry issued in connection with the Dawes plan are called debentures.

A specialized use of the term occurs in connection with the collection of customs, to designate certificates representing an amount of customs duties paid on imported commodities and refundable when the same or other commodities are exported. It is thus a "drawback certificate." The proposal for an export debenture in connection with the McNary Farm Relief Bill in the United States is derived from this meaning of the term.

The origin of the use of debenture in corporation finance is uncertain. Sir Francis Palmer, who has traced the use of the word, finds it mentioned in the Parliamentary Rolls in the year 1415 and in 12 and 13 Edward IV, 1472. The common significance of the term is of relatively recent origin. The word does not appear in the British Companies Act of 1862 but is first mentioned in British company law in the Directors' Liability Act of 1890. It occurs, however, in its present day sense in the British Stamp Act of 1870 and in the Bills of Sale Amendment Act of 1882. In the United States there is no evidence of its use in corporation literature prior to the Civil War, and it is only since 1900 that the term has come into general use to designate unsecured corporate obligations.

Although American debentures are without special security, it has become customary since 1900 for the debtor corporation to execute an indenture or deed of trust for the convenience and protection of the bondholders. The change is illustrated in the General Electric Company's

debenture issues, the issue of 1912 being accompanied by a trust agreement where the issue of 1892 was not. The deed of trust frequently contains a provision prohibiting the debtor corporation from mortgaging its property or requiring that the debentures are to be prior or equal to future issues of mortgage bonds. In this way a number of American railroad debenture bond issues are now secured by mortgages. Among these are the debentures of the New York, New Haven and Hartford, the Boston and Maine and the New York Central railroads. Mortgage restrictions do not as a rule prevent the renewal of existing mortgages or the assumption of mortgages already existing on property acquired through the creation of the debentures.

Even when issued with restrictions debentures do not generally have as high investment standing in the United States as mortgage bonds. This is due to the possibility of the creation by a debtor corporation of an indebtedness, either funded or unfunded, which ranks equally in claim against assets and earnings with the debenture bonds. In the event of default in payment of interest or principal ordinary creditors as a rule have the same rights and claims against the debtor as the debenture holders, since the latter, having no lien, pledge or assignment of property, have no rights of foreclosure. To protect debenture bondholders against the adverse effects of excessive indebtedness by the debtor corporation, the deed of trust under which the bonds are issued generally provides that the corporation must always maintain its current assets above its current liabilities and in some cases above the amount of outstanding debentures as well.

As a matter of financial policy debentures are preferable to mortgage bonds for the acquisition of capital inasmuch as the creation of liens on assets tends to impair the current borrowing on open account or on unsecured notes and other certificates of indebtedness. Nevertheless, general credit conditions or the restrictions imposed by investment bankers or by investors directly may force a business corporation to secure its obligations by a mortgage. Borrowing on mortgage bonds presents the compensating advantage of securing capital at considerably lower cost. Thus many American railroad companies have preferred such bonds, when permitted, as a means of obtaining capital, although they could readily sell debentures at somewhat higher interest rates. With the constant trend toward larger mortgage indebtedness, particularly among the

railroads, the limitations on the amounts of bonds outstanding have compelled recourse to debentures as a means of obtaining additional capital. In order to make these debentures, which are second grade investments, attractive to security purchasers, some privilege, such as the right to convert the bond into stock or the right to purchase stock at a fixed price, is frequently attached to the issue. Obligations of this nature have had a wide appeal to investors desiring speculative opportunities as well as a fixed income return.

DE BOW, JAMES DUNWOODY BROWN—SON (1820-67), American editor and statistician. He was the founder of the *Commercial Review of the South and West*, later known as *De Bow's Review*, at New Orleans in 1846. Rescued from early financial difficulties by Maunsel White, a rich New Orleans merchant, the magazine came to have the largest circulation of any in the South. It was a journal of fact and opinion, devoted to the practical economic and political interests of the South, and it exerted a wide influence. De Bow was appointed to the chair of political economy and commercial statistics, subsidized by his friend White, in the University of Louisiana. Since, however, he had no students he took charge for a year of the state Bureau of Labor Statistics and also issued a three-volume work with statistical appendix, *The Industrial Resources . . . of the Southern and Western States* (New Orleans 1852-53), based upon materials in the *Review*. These two publications form a veritable encyclopaedia of the old South and are valuable source materials for economic historians. Appointed superintendent of the United States census by President Pierce he edited and compiled the census report of 1850 and issued a compendium of that work, the *Statistical View of the United States* (Washington 1854), in which he advocated maintenance of a permanent census staff between decen-

nial periods. He was president of the Knoxville Commercial Convention in 1857 and served as chief agent for the purchase and sale of cotton for the Confederate government. Despite his other activities he published the *Review* monthly until 1862 with but few interruptions; it was revived in 1866 and existed spasmodically until June, 1880. The *Review* showed throughout De Bow's attachment to the principles of Calhoun and its partisanship contributed to hurry on the Civil War. Nevertheless, De Bow refused to exclude such nationalist policies as a protective tariff and federal aid to internal improvement.

BROADUS MITCHELL

DE BROSSES, CHARLES (1709-77), French writer on history and the social sciences. De Brosse was born of a family of lawyers, was educated in local schools and became first president of the parliament of Dijon. His prodigious literary activity fills fifty-two volumes and ranges in subject matter from an account of the excavations at Herculaneum to a treatise on the origin of language, *Traité de la formation mécanique des langues* (2 vols., Paris 1765). His minute erudition is never pedantic and his writings are marked by penetration, originality and sanity of judgment. President de Brosse's posthumously published letters from Italy, *Lettres familières écrites d'Italie en 1739 et 1740* (3 vols., Paris 1799), have been pronounced by Beyle the best account of Italian society in the eighteenth century and are still read for the brilliancy of their style and their searching analysis of social conditions. At the suggestion of Buffon, de Brosse collected the available material on Australia and Polynesia, names which he was the first to bestow on those regions, and published it in his *Histoire des navigations aux terres australes* (2 vols., Paris 1756). His edition of Sallust with elaborate commentaries, *Histoire de la république romaine dans le cours du septième siècle* (3 vols., Paris 1777), he regarded as his literary testament. De Brosse was a pioneer of the science of comparative religion. In his memoir *Du culte des dieux fétiches* (Geneva 1760), reprinted in the *Encyclopédie*, he combated the then prevailing tendency to interpret ancient mythologies and religious systems, notably that of Egypt, as profound symbolism and upheld the thesis that ancient Egyptian religion did not differ substantially from the primitive cults of native Africa. The work, which the French Academy refused to print in its transactions and which gave rise

to violent attacks, anticipates the modern anthropological method of approach to the history of religions.

DEBS, EUGENE VICTOR (1855-1926), American labor and socialist leader. Originally a railroad worker, Debs rose to be national secretary of the Brotherhood of Locomotive Firemen, a powerful conservative craft union. He was one of those conservative unionists who after the events of 1892, when strikes were broken ruthlessly and bloodily and state organs put themselves at the disposal of employers, concluded that labor must revise its tactics. He resigned from the brotherhood and launched the American Railway Union, an industrial organization of all railroad workers, of which he became president. After winning a significant victory over the Great Northern Railroad in April, 1894, the new union in June instituted a boycott of Pullman cars involving twenty-four roads, to assist the striking Pullman employees. Debs' appeal to American Federation of Labor leaders for a sympathetic general strike was rejected, and those leaders even urged the strikers to return to work. By means of a sweeping federal court injunction (which established the injunction firmly as an antilabor instrument) and United States troops sent to Illinois by President Cleveland over the protest of Governor John P. Altgeld, the companies broke the strike and smashed the American Railway Union. Debs was jailed and his career as a trade union leader came to an end. After campaigning for W. J. Bryan in 1896 he joined forces with the Socialists, who had approached him while he was in jail. Convinced of the necessity of political action to advance labor interests he helped form the Socialist party of America in 1901 and became its outstanding popular leader and agitator through his nation wide speaking tours and his writings in the *Appeal to Reason* and other radical journals. He was five times Socialist candidate for president of the United States: in 1900, 1904, 1908, 1912 (when he received over 900,000 votes) and 1920 (when he was in prison and polled 919,799 votes).

Debs helped organize the Industrial Workers of the World with William D. Haywood and Daniel De Leon. While he had no faith in Haywood's sabotage tactics he regarded himself as a "revolutionary unionist," and his break with the I. W. W. was on the ground of opposition to their antipolitical attitude. He continued to oppose American Federation of Labor tactics and to favor a policy of "boring from within and without."

In 1918 Debs was sentenced to ten years in prison for making an antiwar speech. Despite an international campaign for his release Woodrow Wilson refused amnesty. Because Debs had declared himself a Bolshevik from head to foot and because of his record of ultraradicalism the Communist party tried during and after his prison term to win his support. Although he criticized the Socialist party for a loss of revolutionary tone and aims and a tendency to chase votes he never joined the Communists. Released by President Harding in 1921 without restoration of citizenship rights, broken in health, Debs returned to a socialist movement disintegrated by the inroads of patriotic antiradicalism and communism.

His greatest importance was probably as a trade union leader who developed the industrial union idea with wide if fleeting success. To American socialism he contributed nothing new in the way of policy or procedure. Although he appreciated the value of political activity denied by "pure and simple" unionists and the value of struggle in the economic field neglected by most American socialists he made no such close synthesis of his ideas as was achieved by Daniel De Leon. He brought to vast audiences a hopeful evangelical socialism based on a deep feeling for the oppressed. As a native American he made socialism for a time a domestic and hence respectable if vague ideal. He brought internal harmony and a rallying point to the party in a personality sufficiently beloved to attract numerous non-proletarians but insufficiently integrated to build a firm working class movement.

DEBT. Debt is that relationship which exists between two persons when one, the debtor, can be compelled in some fashion to furnish services, money or goods to the other, the creditor. It may be created by failure to pay *wergild* or damages to an injured party or a fine to the community. But ordinarily debt implies that the debtor has received something from the creditor in return for which he is to make repayment at a later time. Debt therefore generally arises when economic development has advanced sufficiently to show decided differences in wealth between different members of the community. As a rule debt is not an isolated phenomenon in a particular society: there is a large class of persons who are constantly, almost permanently, in debt to a smaller class, although these classes in most cases do not constitute the entire communal group.

The loan of property which the borrower is under moral obligation to return when and if he can is a form of philanthropy which must have shown itself sporadically in many parts of the world, particularly in societies in which the sense of kinship is very strong. The *ερανος* among the Greeks and similar associations among the Hebrews were based upon the principle of contributions by a group for the temporary support of a person who was obligated to make repayment when able. In the eastern Mediterranean, as in other parts of the world, philanthropic loans were considered the only justifiable loans. This attitude is reflected in the ethical philosophy of Plato and Aristotle and in Christian, Jewish and Mohammedan ethics.

But of far greater significance for economic development were advances made with the understanding that an amount greater in value would be returned at some future time. The excess of the payment made over the credit extended is called increase in the Old Testament. The term usury, which implied that a charge was made for the use of the loan, gave way in the Renaissance to interest and has since been used to indicate excessive interest charges.

The prevalence of loans for profit implies that the possession of accumulated property beyond that needed for immediate or prospective consumption has become increasingly important

economically and socially. It does not necessarily demand a direct connection between property and political power. But there has been a marked tendency in western Asia and Europe for holders of property to become the holders of political power even in communities theoretically controlled by a hereditary aristocracy. An elaborate system of lending at interest, such as the curious potlatch system so fully developed among the Kwakiutl Indians, may even be the means of establishing and maintaining social prestige. The recurring opportunities for redistribution provided by the potlatch hindered its use for the accumulation of large amounts of property. But where lending for profit is much developed in precapitalistic societies it generally tends to become the most certain and consequently the principal method of accumulating wealth, thus emphasizing the existing economic inequalities.

In the case of the charitable loan or the potlatch, repayment was insured only by public opinion or the sense of propriety, sanctions powerful enough in small and primitive communities. The debt created by unpaid wergild or default in some other penalty developed a type of sanction which went beyond mere public disapproval. The debtor was subjected to retaliation or to being held for ransom by the person or clan injured. Outlawry, such as the Greek *ἀνύλη*, seems to have been a common penalty for default on such debts.

But when the debt was created by a loan for profit, public opinion tended to be on the side of the debtor. A sanction more certain than public opinion and less penal than outlawry or retaliation was needed. Among the Iroquois, it is said, a defaulting debtor was publicly beaten, which may illustrate the transfer of an existing sanction for debt created as a penalty to debts of this nature. Usually, however, sanction was provided by pledging the property or the person of the debtor for the payment of his debt. Property pledged was obviously less immediately needed by the debtor than the thing borrowed. The value to the creditor of pledges such as a ceremonial blanket or a ring lay in the sense of honor which would impel the debtor to redeem them. In most cases, however, the pledge was utilizable property—cattle or slaves—from which the debtor could derive profitable services.

As the money economy became fully established and the economic structure grew in complexity, debtors increased in number and were less likely to have property to pledge. The resulting increased use of the person of the

debtor or members of his family as a pledge caused debt to be associated with slavery in primitive and ancient societies, for in case of default these persons were turned over to the creditor to perform compulsory service. Their status approximated that of slaves captured in war with tribes outside the kinship bond, and in many parts of the world the term slave was unhesitatingly applied to them.

Among the tribes of Washambala and Wasove in east Africa, for example, defaulting debtors seem to have become slaves in the fullest sense of the word, to have lost their personality and to have become as freely usable and alienable by their owners as other property. The same situation is found among the ancient Teutons and Celts as well as in the society depicted in the Vedas. The debts specifically mentioned, however, are almost always penalties imposed for some infraction of law or custom, although in a few instances it is clear that the origin of the debt had no consequences in its nomenclature or treatment. Such apparently was also the case in the few instances of debt slavery which are to be met with in America.

But in the Mediterranean countries, in Mesopotamia, Syria, Egypt, Greece and Italy, a distinction was always maintained between debt slavery and ordinary slavery. Some practical distinction was inevitable, since the debt slave had free kinsmen and friends who would actively resent abuse, although it is probable that abuse of slaves of any kind was extremely rare in ancient communities. There was also a theoretical distinction in accordance with which the debt slave was inalienable, at any rate outside the community, and he could be held only for a limited time. After a period of three years in Mesopotamia and six years at a maximum in Palestine he was to be set free. In Greece and in Italy there was apparently no limit of time, but a vague understanding existed that he was to be released when the accumulated value of his services equaled the debt and accrued interest. These restrictions were constantly evaded and more and more openly disregarded as a money economy became an increasingly marked feature of the community. Especially obnoxious was the frequent sale of debtors into foreign slavery, a practise into which creditors were readily enough tempted by the fact that it was the readiest way of obtaining a real repayment and much the most profitable form of disposing of what was an irksome security.

The fact that a large part of the free popula-

tion was thus constantly threatened with reduction to a servile condition colored the political history of Mediterranean nations. The Solonic reorganization in Athens in the sixth century B.C. was based upon the demands of debtors for protection and relief, and even the highly idealized accounts by Roman historians depict the civil disturbances of the state as the direct outcome of movements to relieve oppressed debtors. In both Rome and Athens the relief ultimately took the form of a complete abolition of debt slavery and the prohibition of loans on the security of the debtor's person. If it is true that the half mythical lawgiver King Bocchoris of Egypt abolished debt slavery in the eighth century B.C., it was only as a regular incident of debt. Apparently a debtor could still contract in advance that judgment be taken against his person if he failed to pay. Documents prove convincingly the presence of debt slavery in Egypt throughout Ptolemaic and Roman times in a form deprived even of the ancient safeguards, since such slaves were freely alienable except in Alexandria where, as in very ancient Rome, they might be sold abroad but not within the city itself.

Credit on the security of land or chattels had always been found side by side with loans on personal security and was doubtless preferred by creditors. Bad harvests or periodic depressions would result in many defaults and cause the dispossession of the small holder, who thus increased the number of the landless proletariat and created new economic and political problems.

But in Rome, for example, when this process of dispossession was nearly complete and debt slavery legally abolished, the increase of wealth by loans for profit ceased to be an important form of acquisition (about the second century A.D.). The great Roman fortunes were built on agriculture, on foreign commerce and above all on financial speculation in tax farming. Lending of money at interest was freely practised, largely by Greeks and Syrians but also by Romans; it was, however, of relatively minor economic importance.

None the less, the exactions of petty creditors in the later empire were sufficiently oppressive to contribute to the general wretchedness of the economically weakest classes. Personal execution after legal judgment had long existed; and while it was not debt slavery, since the debtor's services could neither be used nor his person disposed of, it enabled the creditor by arresting

the debtor to obtain the same result as though he held him for ransom. There were also abundant traces in Rome, as in Europe until recent times, of an ancient custom of seizing the corpse of a defaulting debtor as a means of enforcing payment from his heirs. But all the later imperial legislation and jurisprudence tended toward lightening the physical burden of debt. Exemptions and a system similar to that of bankruptcy barred personal execution in most cases; its continued use was probably due to laxity or corruption in the administration of justice.

Under the system of the colonate and under feudalism money and commerce receded as primary factors in the life of the people and credit was insignificant. The principal way in which debt arose was from penalties and amercements for infractions of law, and this type of debt was always enforced by seizure and detention of the person. In the tenth and eleventh centuries, however, credit showed itself in two fields. The countless military organizations required by the feudal states and the multiplication of military enterprises, which culminated in the grandiose undertakings of the crusades, involved larger accumulations of money than were readily available. The growth in northern Italy and later in western Europe of large scale commerce as distinguished from local fairs and markets also required credit.

But the new credit arrangement did not create a powerful creditor class facing a weaker debtor class. Power was still associated almost exclusively with ownership of land and the church prohibition of all lending for profit made the credit risk very high. As long as this prohibition restricted money lending to foreigners—Jews, Lombards, Caorsini—the creditor class could rely in case of default only on the possibility of future retaliation. But as commerce increased in each particular country and the feudal organization decayed, credit transactions within the community itself became frequent. How were creditors to be assured that the engagements of their debtors would be fulfilled? The mediaeval practise of pawning signet rings and jewelry could not be widely extended. The most obvious form of security was landed property and the widespread use of mortgages on land as security for debts was inevitable.

The essence of the mortgage is that the debtor remains in possession and enjoyment of the land until the debt is due. The instruments that created or proved the debt generally provided that upon default the land at once became the prop-

erty of the creditor (the mortgagee). The special importance of land in the feudal system created an intense repugnance to any such easy forfeiture. Land was still essentially the basis for social rank and the paternalism that succeeded the feudal relation of lord and serfs in England and France offered marked resistance to any easy change of personnel. Mortgage forfeiture was granted only reluctantly and redemption was favored, as it had been under Roman law.

Creditors were favored by an extreme rigidity in the interpretation of formal contracts. In general a man was bound by what he had signed or sealed and excuses or explanations were given slight attention. This was emphasized by the growth of bills of exchange, in which the tenor of the instrument was conclusive and claims of fraud and overreaching were rare, once the bill was issued and current.

Obviously a debtor class that can offer land as security is not a proletariat. Indeed, debt was rarely found among the economically poorest of the population—the tenant farmers whose leases were usually for short periods or terminable at will and the agricultural laborers. The system of imprisonment for debt, which existed throughout the post-mediaeval period well into the nineteenth century and which has left substantial vestiges, primarily affected the ruined members of the middle and upper classes. The mass of the people was unaffected. As far as England is concerned, this is evident from Dickens' *Pickwick Papers* and *Little Dorrit* as well as from scattered references by other English writers of the eighteenth and nineteenth centuries. It was even more true on the continent, where conditions in many countries remained feudal until recent times. Men burdened or ruined by debt normally belonged to the fringes of the propertied classes and their displacement made no great impression on the country as a whole.

It must have come as a distinct shock to those to whom the moral implications of debt were paramount to realize that constant and permanent indebtedness of large numbers of the community was an essential element of capitalist organization. Security in capital investments did away with the necessity for periodic repayment, since the capital would merely be reinvested. Therefore money loaned out on mortgages need never be called in, even though the mortgage was for a definite period of time. The landowner was fully compensated for permanent indebtedness by the increased profits which flowed from wise use of borrowed capital. Unwise use of the

capital, however, might add a constant burden to the land and make it inadequate as a source of livelihood. The debtor would then be in danger of being dispossessed and forced into the proletariat.

The large scale enterprises of the post-Renaissance period gathered capital from many individuals for terms which tended steadily to increase in length. These enterprises continued and expanded the practise of "bottomry loans"—speculation on the successful voyage of a sailing ship—which already had a long history. The fact that these companies were all engaged in trade with distant ports is an indication of the part played by imagination and the desire for adventure in the advance of credit. Men who would be loath to lend money except on ample and visible security at home readily entrusted their accumulated wealth to a few men, with power to use it as they chose in lands thousands of miles away. The Virginia Company, the East India Company, the Muscovy Company and the Hudson's Bay Company were the models followed by many other companies which promised magnificent returns to all who would entrust money to them. The disastrous failure of the South Seas scheme in England and of Law's financial enterprise in France checked only temporarily the willingness of people to provide money for enterprises which promised profit.

The tendency to look upon debt as a more or less normal characteristic was aided by the example of the public debts. Such debts increased enormously in size while the view gained strength that they need not be repaid immediately since so long as interest requirements were met they furnished the safest form of investment for funds. Debts similar to those of the state in size and duration were increasingly contracted by the large corporations which developed after the first part of the nineteenth century. Corporate bonds were frequently secured by mortgages on tangible property but their value came increasingly to depend upon the earnings of the corporation. Similarly corporate stockholders have tended to lose their control over the corporation and have become more and more like lenders of funds to the corporation. No effective means have yet been found to insure that corporations will manage their borrowed money with that reasonable, prudent and honest management which alone can offer anything approaching security to the lender.

The recognition of several standards in which

payment may be made lends uncertainty to debt agreements. Ancient contracts therefore frequently stipulated payment in a particular currency—the Aeginetan, the Euboic or the Alexandrian stater, for example. Modern provisions for payment in gold partake of a similar nature, but their primary function is to guard against changes in the value of legal tender in a particular country. In Roman history such changes were rarely abrupt enough seriously to affect private debts, which were usually of short duration. Prices mentioned in Greek papyri indicate, however, that a marked change did take place in the second half of the third century. The Jewish rabbis provided for an adjustment of debts in accordance with changes in the purchasing power of money. The debasement of the coinage by public debtors during the Middle Ages had little significance for the question of credit in general, which was of relatively slight importance at that time. Not until the end of the eighteenth century in the era of political and industrial transformation did the notion of relieving the debtor class by varying or multiplying the forms of money obtain its extraordinary hold on great masses of people. It is around this question of inflation or cheap money that the modern struggle between debtor and creditor has been waged.

The history of the United States during the nineteenth century illustrates the large scale operation of the debtor-creditor relation. The rapid construction of railroads and the sudden rise of large communities after the middle of the century caused a feverish speculation in agricultural investments in the states on both sides of the Mississippi. Since the resources of the land were unquestioned, money was readily forthcoming from banks that were directly or indirectly controlled by eastern banks and by European financiers. The depression of 1873 left most of these newer communities in a condition of insolvency, burdened with debts which the profits of their crops could not amortize and for which they could barely meet the interest charges. This large scale indebtedness, however, did not produce movements directed to social and economic reform; rather, the fact that entire states were involved made other and simpler devices seem feasible. The peculiar political organization of the United States might have enabled debtor states to deal rather summarily with obligations owed by its citizens to citizens of other jurisdictions, if the full faith clause of the constitution and the federal control

of bankruptcy had not interposed a check. Repudiation of state debts was attempted by a number of states, chiefly in the south. In general, however, financial legislation, particularly the multiplication of paper and silver money to make money "cheap" and thus facilitate discharge of obligations, seemed the easiest way of removing the financial pressure. Whatever may have been the economic soundness or unsoundness of these proposals, their social and psychological bases are clear enough. Communities that had grown rapidly and had, perhaps prematurely, developed a sense of local unity and pride of accomplishment found their plans of development checked or rendered possible only under an onerous and galling control by outside forces.

It was primarily the accumulation of individual debts rather than state obligations that created the notion of burdened communities in the United States. But state obligations also involve an increase in private burdens through taxation and when very large may hamper the important function which the state normally assumes in facilitating the growth of the community. This was never fully and drastically illustrated until after the World War. After 1918 the public debts and obligations of most European nations reached the crushing total of many billions of dollars superimposed upon the normal national debts, which had become one of the commonest and most popular forms of investment. Except for Russia, which a cataclysmic revolution placed in a wholly separate class, the process of rehabilitation in all European communities was obviously hindered by the need of carrying this huge total of debt as a first lien on all the resources of the respective countries. It was feared that these resources would be permanently drained in paying the debts. If the creditors were nationals of the debtor countries, the matter could be handled by a virtual repudiation of the internal debt, however the operation might be disguised. The creation of a wholly new currency in Germany was a practical repudiation of its entire internal debt, public and private. The process of inflation caused the almost complete ruin of what had been Germany's middle class. The stabilization of the French franc at one fifth its former value in gold was a somewhat similar measure, which did not result in the elimination of the small creditor class only because inflation had been more gradual than in Germany.

But the war debts were owed largely to other governments, especially to the United States

They could thus be neither repudiated nor manipulated. The effect has been to create in Europe what had previously existed in the debtor section of the United States, an almost intolerable sense of debt servitude to foreigners, and to give rise to all the emotional outpourings which such a feeling carries with it. The picture of the United States as a relentless creditor has seriously impaired unified cooperation in an economic restoration in Europe. The expressions capitalist and proletarian have been applied to countries as a whole, and not merely demagogues but responsible leaders of opinion have left no doubt that they regard the situation as abnormal and unstable. Refunding processes have removed the immediately coercive character of the creditors' demands, but they have not taken away the attitude of resentment and hostility that are inevitable under the circumstances.

In ancient society all the risks of the credit relation were borne by the debtor. His need was urgent; he could rarely stipulate for favorable terms; he regularly pledged his freedom or his livelihood; and a single untoward accident was certain to result in default and forfeiture. If governmental aid was desirable, it was the debtor who could claim it. Measures of various sorts were devised for his relief—the abolition or limitation of interest, the Biblical sabbatical year, compulsory remission of debts or of accrued interest. A system of exemptions withdrew from seizure for debts certain goods which the debtor required for the sustenance of himself and his family—his plow, his cow, his harness. In Roman law an exemption, which came to be called the *beneficium competentiae* and whose extent was left to the magistrate's discretion, appeared fairly early. These systems of exemption greatly multiplied in the United States. Nearly every state has a list of such exemptions, some of which indicate clearly enough the date at which they were introduced and imply an obsolete social background. The most extensive is the homestead exemption, which protects the property actually used as a home, although its value may be relatively high.

In the eighteenth century the spectacle of small tradesmen ruined by improvident extension of credit must have been frequent enough to suggest that not all the burden rested on the debtor. But it was reserved to the nineteenth century to increase many fold the insecurity of the creditor by removing imprisonment and other penalties for debt and by facilitating discharge in bankruptcy.

The agitation in England against imprisonment for debt was chiefly humanitarian and was countered by arguments based on the immorality of encouraging extravagance and fraud. The economic implication of the system did, however, appear to some extent in newspaper discussion and parliamentary debate. The agrarian classes, both landholders and farmers, were indifferent or opposed to repeal on the ground that the risk of imprisonment acted as a restraint on incurring debts. It was taken as an economic axiom that credit was an evil, to be kept within the narrowest possible limits. It is noteworthy that the parliaments before the Reform Bill, largely composed of landowners, showed no interest in the matter, and that the reformed parliaments, with their much greater percentage of business men, almost immediately took steps to remedy what seemed an ancient abuse. Arrest in mesne process, that is, imprisonment of the debtor to insure his appearance, was abolished in 1838 against vigorous opposition, and at the same time a Judicial Commission reported in favor of abolishing entirely imprisonment for debt. This recommendation was repeated in 1842, and a law to that effect was finally passed in 1869 as part of a general bankruptcy act. This law has been amended several times but its general purpose is to distinguish between an ordinary contract debt, which may not be enforced by threat of imprisonment, and a debt involving fraud or wilful disobedience of court orders, which may be so enforced.

The effect of the Debtors' Act was to remove from the operation of imprisonment for debt most persons of the type depicted in literature as victims of this institution, the insolvent members of the middle and upper classes. But a relatively large number of small debtors continue to suffer imprisonment, since the local courts not infrequently find fraud or contumacy when a judgment remains unpaid. Thus in 1905, 11,427 debtors were imprisoned by the county courts; in 1927 the number fell to 2875. The fraud required is usually far short of the penal offense of that name, and the court regularly finds contumacy present when it is satisfied that the debtor could raise the money if he tried; it is thus evident that the agitation which condemned imprisonment for debt *in toto* has not quite attained its object. E. H. Parry in *The Law and the Poor* (London 1914) cites numerous instances which demonstrate that the residue of the system is still sufficiently oppressive.

In the United States a great many state con-

stitutions undertake to wipe out imprisonment for debt by a single sentence, but in almost every case the qualifications—very much like those mentioned in the English debtors' acts—have produced the same results as in England. A certain number of poor debtors—the indefiniteness is due to the hopeless inadequacy of American judicial statistics—are annually committed to jail for failure to meet obligations which in popular view are indistinguishable from ordinary contract debts.

Agitation against imprisonment for debt took the same tone in both Germany and France as in England. In France the Convention abolished it in 1793, but the revolutionary assemblies promptly reintroduced it; it was finally abolished in 1867. It was eliminated in the North German Confederation and in Austria in 1868 and in the whole German Empire by the Code of Civil Procedure of 1877. The only vestige in France is in connection with judgments for damages obtained as an incident to criminal prosecutions, which include a great many cases that would be classed as torts under the English common law. In Germany imprisonment for debt is retained only in cases which indicate what amounts to wilful contumacy on the part of the debtor.

Bankruptcy as originally known in Roman law and in mediaeval Italy was primarily concerned with preventing the defrauding of creditors by concealment of inequitable distribution of the debtor's assets. It was not until the eighteenth century that a few carefully safeguarded cases enabled an honest bankrupt to make a fresh start, wholly or partially relieved of his debts. In England and on the continent, however, the law and practise of bankruptcy are chiefly concerned with the interests of the creditors and debtor relief is incidental. Some slight changes in the debtor's favor have recently been made in France but not enough to alter the character and tone of the system.

In the United States the bankruptcy statutes have almost from the beginning been designed to aid the debtor rather than the creditor, although courts profess to have the interests of both equally in mind. Discharge of the bankrupt is in most cases obligatory. The check on repeated bankruptcies is slight and inadequate. The privilege of bankruptcy is not confined to merchants, as it is abroad. Farmers and wage earners are favored by making it impossible to force them into bankruptcy, although they may voluntarily take refuge in it. The result is that

most persons may repudiate their accrued debts almost at will and suffer only a relatively slight loss of credit by so doing. The amount thus repudiated, far over a billion dollars a year, must somehow be carried by debtors who do meet their obligations.

Even where there is no formal discharge, the burdens and difficulties of enforcing collection from an unwilling debtor are often great enough to induce the creditor to write the debt off rather than attempt to collect it. In the absence of body execution the creditor's only resource is execution against property. When the property was an interest in tangible goods or immovable landed estates, a certain amount of security for the creditor was created by that fact. But an enormous fraction of modern wealth consists of intangible rights easily transferable and far more elastic in value than goods or lands. The property owned by a debtor is itself likely to be obligations of other persons, stocks, bonds and bank accounts, which can be readily concealed or disposed of rapidly and secretly and which when seized may turn out to be worth much less than their face value.

Speculation, economic instability, the corporate structure, inflation and bankruptcy are as important in the modern debt problem as was the reduction of the debtor class to a semiservile condition in ancient society. It has been seriously maintained that existing conditions are inevitable and that any change is undesirable since it would slow up social progress considerably. International economic cooperation, however, may remove many of the elements of instability from our system; with the elimination of many of the most effective stimulants to speculation and unwise expansion, the debtor-creditor relation may acquire a totally new aspect.

DEBTORS, RELIEF OF. *See* DEBT.

DECADENCE is a concept which signifies the descending swing of the cycle of change. It is applied to the apparent decline of any social phenomenon for which observation or philosophy suggests a serial development: races, nations, institutions, religions, manners, techniques, arts. Similar periods of decline in the phenomena of the natural sciences may be analogous to decadence but fundamentally they involve different problems. A progressive decline in vigor which results from physical or biological changes represents degeneration (*q.v.*) rather than decadence. The latter is primarily a term of description and evaluation for certain aspects of social change.

There may be profound social changes, however, without decadence in the forms which those changes affect. Mechanical inventions,

discoveries, cultural innovations, supplant or alter the old way of life while it is frequently still in its full vigor. Sailing ships may be considered decadent today, but the vessels produced by the old shipbuilders when the first steamship made its ominous appearance were in every way true to the traditions of the craft, and the sailing ships of the present although they are diverted to the whim of sportsmen have never been surpassed in craftsmanship. Decadence is not always involved even in insalutary changes. The latter may be of short life and small significance; they may result from chance, violence, an authoritative fiat, an accidental blunder. The concept of decadence premises a continuous state of inaction or debility.

Occasionally entire cultures have been described as experiencing a state of decadence—imperial Rome, for example, or Bourbon France. But the complexity and diversity of cultural activities are so great that it may be doubted whether all forms of a culture are ever likely to undergo decline simultaneously. It is true that they are largely interdependent, but the decadence of one form of activity may merely point the direction for the development to be taken by another form. The decadence of Rome's political power and of her economic competency in the fourth century furnished issues with which her religion might struggle, but Christianity in Rome was certainly not decadent at that time. Paganism was in its decadence while Rome was still a powerful state. A particular cultural form, moreover, can be considered decadent only in the context in which it has developed. The Roman administrative system, for example, was decadent at Rome, its base, because the requirements put upon it were too severe for its machinery; but that same system transplanted to Constantinople continued to function satisfactorily for another thousand years. The term decadence can safely be applied only to the gradual decline in a particular environment of a particular cultural institution or technique.

As an aspect of historical change the problem of decadence has figured indirectly in the efforts of scholars to construct a philosophy of history, and its ultimate significance has been variously suggested, although seldom examined as a problem in itself. To the early Christian historians, their followers in the Middle Ages and their ultimate exemplar, Bossuet, the course of history was explained in theological terms and decadence was thus an irrevocable punishment

inflicted by God. To the philosophers of progress and of universal law—Bodin, Montesquieu, Turgot, Kant, Condorcet, Comte, for example—periods of decadence were only incidental aberrations from an indomitable advance. To Voltaire decadence was the accident of chance and to Rousseau all civilization was decadent and would become increasingly so as it departed from the state of the noble savage. And to a long list of scholars, from Ibn Khaldun through Vico, Hume and Burckhardt to modern German philosophers of history, notably Oswald Spengler, decadence is part of a ubiquitous process of cyclical fulfilment and decay, of birth, adolescence, maturity and death.

Thus a search for the significance of decadence gives historians, as critics, a disguised outlet for their moral prejudices and it furnishes them, as philosophers, with one of the premises for their favored interpretation of events. The logic of decadence can more profitably be considered without reference to a philosophy of history. When a phenomenon gradually disappears or passes into a new phase, what are the causes and what the characteristics of that transition?

In the utilitarian items of culture—those forms which exist to serve a practical purpose, such as political, economic and social institutions—there are two principal reasons for decadence to which all minor causes can be referred: functional debility and inadequate leadership. The first may mean a decline in functional efficiency, as in the political decadence of seventeenth century Spain; or a disappearance of function leading to decay of the form, as in the replacement of feudalism as a way of life for western Europe; or a growing inability to compete with other means for fulfilling the same function, as in the decline of monarchy in favor of democracy. Inadequate leadership led to the dissolution of the commercial supremacy of Venice and also of Spain and was a factor in the decay of feudalism. Obviously a particular cause can seldom be found operating *in vacuo*. Neither are these generalized causes of decadence in themselves the complete explanation. The causes and the characteristics which develop from them are scarcely separable. Inertia and the grip of tradition, overelaboration of procedure, unearned privileges, tyranny and corruption, exaggerated individualism, absence of curiosity and of hardy experimentation, are equally stigmata, whether causal or consequential. They become obvious in institutions which

are merely traditional and no longer functionally necessary, in sovereignties which can neither control nor protect, in administrative machineries which are cumbersome and ineffective, in economic structures which are an imposition on the masses of the population, in pervading philosophies of self-indulgence and of disregard for the future.

The bitterly fought concept of racial degeneration, whose advocates cite such disabilities as decline in stature, liability to disease and infertility as evidence of its reality, has been valiantly advanced as a cause of social decadence. Scientific proof, however, shows a conspicuous lag behind the claims of the faithful. Racial degeneration depends on the biologists for proof and until something more is known of it than at present its cultural implications are merely conjectural.

Contemporary institutions may have some of the familiar evidences of decadence, and history may suggest that they have run their course. Capitalism, the family, democracy, Christianity, are frequently described as approaching their ruin. Spengler is the foremost contemporary prophet of decadence and his thesis of the impending doom of the entire western civilization, coming appositely on a war ridden and discouraged world, found thousands of sympathetic readers. But Spengler posited inscrutable laws which work majestically and, unless circumvented by almost superhuman energies, inevitably toward a cyclical progression of all cultures. If this premise is doubted his argument of contemporary decadence may also be doubted, for we have not the perspective to evaluate shorter cycles. It is possible, for example, that it is merely our familiar form of capitalism that is decadent and that there is in preparation a new capitalist economy, such as Wells' world state; or it may be that capitalism is only in its adolescence and that what looks like its death agony is no more than growing pains.

Whether a civilization or a nation can avert an imminent decadence, whether an institution or a religion, an art or a complex of manners, can be diverted from an impending disintegration, are questions that have always interested students of society. The impossibility of their solution makes them only the better adapted to speculation. Inadequacies and corruptions in a current scheme of things can perhaps be reformed. Improvement and adaptation are as much a part of the course of events

as are paralysis and collapse. The extent to which improvement and adaptation come of themselves, as a result of a process of *laissez faire* and muddling through, or the extent to which they can be imposed by brilliant administrators, the extent to which even these administrators are themselves only the fortunate instruments of favorable circumstances, are questions probably forever moot.

Those forms of culture which are primarily intellectual, emotional or creative rather than practical—such as religion, morals, art, science, thought—are shaped to purposes which are uncertain of definition and they are therefore less susceptible of pragmatic evaluation.

In reference to these forms decadence has been used with various connotations. Any departure from traditional standards, for example, implies a state of decadence to those persons who believe in the permanent value of established norms. To the fundamentalist and the authoritarian new banners of thought and new explorations of creative energies are symbols of decadence, whether they be indicated in liberal religious doctrines, the moral codes of younger generations, revised patterns of conduct, innovations in the arts, counter-Biblical theories in the sciences or any other form of progressivism.

On the other hand, a mere absence of interest, of whatever quality it might have been, or a protracted dearth of significant production is sometimes considered an indication of decadence. There was a widespread intellectual apathy, for example, in the Scandinavian countries during the early nineteenth century; the early American frontier, actively concerned with the business of keeping alive, produced no great art and showed little interest in art; there is at the present time a growing indifference toward religious dogma and moral standards. But a mere inhibition of creative energies or suspension of general interest implies decadence only superficially. There are other and more significant connotations of the word which derive from positive and integral characteristics. These are most easily illustrated in the arts, although there are obvious analogies in other related forms of culture.

There seems to be an inner katabolism in specific art forms which brings them to decadence after the complete expression of that form has been stated and exhausted. The process in its simplest terms is first groping and experimentation, then a flowering in full creative vigor and finally a consolidation of the

tradition, characterized by creative sterility. The stigmata of this decadent period are various. Subject matter may become the artist's central interest rather than a search for appropriate expression, and thus in his desire for novelty he may reach for the abnormal, the exotic, the sentimental or the melodramatic. Or great refinement of perception and of expression develops and the artist becomes merely precious. Or the appearance of quality is simulated by a competent technique, while the work remains superficial and insincere. Or dead rules and standards are made out of what was once a body of craft wisdom and the artist becomes a virtuoso. But whatever manifestation it takes, the decadence implicit in such works arises from the fact that the specific form has reached the limits of its expression and until a new development is evolved there can be only elaboration and exaggeration of the old.

The prevalence of such qualities in the work of any period or their presence in the work of any particular artist does not of necessity indicate a condition of decadence. They may be only incidental aberrations or they may be the essential tradition of the craft, as careful following of rules held to be divinely inspired was an integral function of early Indian art and as excessive delicacy and refinement were the very substance of Japanese art until about the seventeenth century. The progress toward decadence, in fact, is seldom a neat sequence of easily discernible rise and decline. The cycles of various arts are seldom in harmony with one another, and even in a single art some forms may be in a state of decadence while others are developing with primitive vigor. The arts, moreover, are not free to develop in isolation their various methods of expression, for they are always affected in their development by prevailing cultural conditions. In a time when the elements of contemporary life—its preoccupations, interests, ideals, its tempo, prejudices, tendencies, values—are in a state of readjustment the artist will reflect the unrest around him and an art nominally decadent becomes equally the instrument of a new synthesis.

But with a proper hesitation about applying it too easily and with a careful statement of the problem the concept of decadence is a valuable critical tool. There is reason in seeing integral decadence in later Greek sculpture when it exploited the horrible or the sentimental; in the elaboration and whimsicality of later Byzantine and later Gothic architecture; in much of

the literature and painting of the seventeenth and eighteenth centuries with their slavery to classical "rules"; in the precious classicism of the French *parnassiens*; in nineteenth century American architecture when it copied classical forms with no regard to their functional appropriateness.

The most vivid example of artistic decadence, however, and the one most commonly considered archetypal is found in the work of a group of French writers in the later nineteenth century. Gautier, Huysmans, Verlaine, Mallarmé, Baudelaire, were the leaders, and the *Yellow Book* circle in England proved that their radius was not confined to France. With this group the essential qualities of decadence were consciously exalted as ends in themselves. Decadence became a philosophy of art. Seventeenth and eighteenth century historians—Bossuet, Montesquieu, Gibbon—had enunciated the idea of decadence in reference to the disintegration of the Roman Empire, and all aspects of later Roman culture came to be described in those terms. Thus when a form of literature developed in the nineteenth century having certain resemblances to the work of the obscure group of Latin poets of the fourth century the epithet of decadent was applied by the critics and even accepted as a shibboleth by some of the writers. Baudelaire expressed the philosophy of the group when he wrote that "the language of the later Latin decadence—the departing sigh of a robust person already transformed and prepared for the spiritual life—is singularly appropriate to express passion as it has been understood and felt by the modern poetic world."

The resemblance between the two periods, however, was not due entirely to an imitation of the first by the second. In both the tradition had become familiar and a little jaded; artists were either incapable of breaking away and carving new life out of new conditions or their environment was not sufficiently stimulating to demand a new expression. Thus the old approaches were retained and creative vigor was expended in elaborating them to their full capacity. The result was a style characterized by one of its own practitioners, Gautier, as "ingenious, complicated, learned, full of shades of meaning and research, always pushing further the limits of language, borrowing from all the technical vocabularies, taking colors from all palettes, notes from all keyboards, struggling to render what is most inexpressible in thought and in form the vaguest and most fleeting con-

tours; listening, that it may translate them, to the subtle confidences of the neuropath, to the avowals of ageing and depraved passion, and to the singular hallucinations of the fixed idea verging on madness. This style of decadence is the ultimate utterance of the Word called upon to express everything, and pushed to the utmost extremity."

The *fin de siècle* group represented the final stages of the romantic movement. Its characteristics—a disgust for the commonplace, a search for strange sensations, an interest in the morbid, the exotic, the mystic, the shocking (in Baudelaire's phrase, the "phosphorescence of putrescence"), a philosophy of defeatism and inaction, an extreme subtlety in style and novelty in vocabulary, a perfection of detail rather than unity of the whole—can be easily understood as an exaggeration and distortion of the elements of romanticism, the final expression of a tradition lingering over into an age in which it had no roots. It was decadent not because of its philosophy or subject matter or method but because it pushed to its farthest extremes a way of art which had developed under other conditions.

Decadence is not of necessity a term of derogation. Within its limits a decadent art may be one of high integrity. There are elements of decadence in some of the greatest masters of art and in some of its most majestic ages. A decadent art in the hands of a master is, in fact, likely to contain the elements of a new synthesis in its very exhaustion of the old. Thus Aristophanes, Ovid and Tacitus, Watteau, Inigo Jones, Flaubert, Baudelaire, Debussy, Proust, D. H. Lawrence—these and many others although implicitly decadent have fashioned an art of integral validity.

The concept of decadence is in all its applications merely an aid in evaluating historically the vigor of cultural forms. Its standards are not moral but practical or philosophical. An age of conspicuous decadence, such as the later Roman Empire or France before the revolution, may contain a richer heritage for the individual than will another period of more primitive vigor, just as a decadent art may be subtler and more sophisticated than an archaic one. Only those cultures or those aspects of culture which are in a state of flux have in them the possibilities of greatness. There is neither decadence nor grandeur in a placid stability.

DECENTRALIZATION. The process of decentralization denotes the transference of authority, legislative, judicial or administrative, from a higher level of government to a lower. It is the converse of centralization and should not be confused with deconcentration, a term generally used to denote the mere delegation to a subordinate officer of capacity to act in the name of the superior without a transfer of authority from him.

Although modern states have been chiefly influenced by the trend toward centralization in the last century, there are persistent counter tendencies. The clue to many of these is to be found in the political self-consciousness of specific groups or in divergence of economic interests within a political unity. The sudden rise of a number of new states, fragments of the former Russian Empire, is a striking case of decentralization carried to the point of complete rupture; the establishment of the Irish Free State and the steady improvement in status of the dominions of the British Empire offer one of the most important contemporary examples of what may be called political decentralization.

The Standing Committee on Scottish Bills in the House of Commons and special administrative agencies, culminating in 1926 in the office of secretary of state for Scotland, have long preserved a degree of autonomy for Scotland within the United Kingdom. The pressure of imperial, foreign and general economic problems in the House has so diminished the time available for consideration of domestic problems that a strong demand has been made for the establishment of separate parliaments for Scotland, Wales and England. On June 4, 1919, the House of Commons signified its approval of this program and established a Conference on Devolution, the report of which (Cmd. 692, 1920) presented alternative plans. No action had been taken as late as 1930.

The degree of centralization which has characterized France since Richelieu has often provoked a desire for some degree of local self-government. The marked trend toward decentralization in the early years of the revolution proved premature; the efforts of the communards in 1871 failed to dislodge the central authorities; in fact, the Napoleonic structure has not been seriously modified. An extensive literature on regionalism nevertheless testifies to dissatisfaction with the historic centralization of power at Paris.

Strong counter movements against the authority of the German national government in various parts of the Reich have filled the last decade with clamor; and the unparalleled growth of the influence of the Deutscher Städtetag suggests that German cities as well as *Länder* may furnish points of resistance to overcentralization in the Reich. Repeated but fruitless conferences have been held in Germany to reconsider the present distribution of power.

Between the American states and the federal government no such pronounced shift has occurred as in Germany. While the general tendency is in the same direction, counter movements are clearly in evidence. Among these is the tendency to develop regional organizations of states, sometimes informal, sometimes of a legal character. The conferences of governors of the New England states and the conferences of governors of the Rocky Mountain states are cases in point, while the Port of New York Authority illustrates interstate organization of a legal character. The growth of organizations of state officials and the contemporary development of related staff agencies, such as the American Legislators' Association, tend to strengthen

the power of resistance of the states against the general drift.

The enforcement of the Eighteenth Amendment, vested concurrently in the United States and the states, was thought by some to impose an obligation on the states to enact enforcement statutes. This view has been rejected by the Supreme Court, and changes in opinion in some states now illustrate a type of decentralization resulting in the repeal of the enforcement statutes and formal refusal on the part of the states to cooperate in enforcement.

Within the states there is a steady movement in favor of constitutional home rule for cities, which, inaugurated in 1875 by Missouri, had extended by 1930 to fifteen states. In other states the legislature authorizes cities to choose one of several optional forms of charter or grants a limited statutory home rule.

The establishment of public or quasi-public corporations for the purpose of administering public enterprises is an interesting type of decentralization, varying in degree from those activities undertaken *en régie*, in which the control of the corporation by a public body is immediate and in which the latter's budget includes the budget of the corporation, to independent corporations endowed with legal personality separate from that of the parent authority.

The advantages claimed for decentralization are: relief of national legislatures from a constantly increasing burden, which is destroying their effectiveness equally in local, national and imperial spheres; promotion of citizen interest in government by means of wider popular participation; retardation of conditions favorable to bureaucracy by breaking the administrative hierarchy at specific levels of government; closer adaptation of legislative and administrative methods to the needs and opinions of given areas; enlargement of the opportunity for experimentation; and, so far as the use of public corporations is concerned, protection against political interference in the conduct of administrative operations.

In a decentralized state the delineation of power between central and local agencies is difficult to adjust in the first place and to modify in the light of advances in social organization and technology. Flexibility is ordinarily sacrificed to stability. A delicate adjustment of governmental machinery is needed to provide for the necessity of coordinated action in some directions, minimum standards in others and the

widest diffusion of knowledge in all. Special means must be employed to secure the necessary coordination and to stimulate relatively weak and backward areas, whose deficiencies fall not only upon themselves.

Under the doctrine of pluralism the state becomes primarily a great coordinating agency, its existing centrally administered activities being distributed among functional groups. G. D. H. Cole foresees also a geographical devolution within the functional and political groups by means of which the great bulk of administrative work, both political and economic, will be performed by regional bodies.

DE CESARE, CARLO (1824-82), Italian economist. De Cesare occupied a number of important posts in the Neapolitan and central Italian governments. He was a member of the first and second Italian parliaments and was made senator for life in 1876. His most important appointment was to the position of controller of credit institutions and other joint stock companies for the central government in July, 1866. During his tenure of office De Cesare published two reports, *Il sindacato governativo, le società commerciali e gli istituti di credito nel regno d'Italia* (2 vols., Florence 1867-69), which are among the best sources for the history of credit, cooperation, joint stock companies and speculation in a fateful period of Italian eco-

nomic history. De Cesare is merciless in exposing the sins of promoters and untrustworthy or careless directors, and the discontinuance of the central controllership in September, 1869, was probably due to his ruthless supervision. He defended the idea of a central bank against unlimited freedom of issue in a tract, *Le banche di emissione* (Rome 1874), which derives value from his official experience. De Cesare also wrote a textbook on political economy (*Manuale di economia pubblica*, 2 vols., Turin 1862), an essay on the economics of his native region, *Intorno alla ricchezza pugliese* (Bari 1853), and a biography of Antonio Scialoja (*La vita, i tempi e le opere di Antonio Scialoja*, Rome 1879). He ranged himself with Scialoja and the moderate interventionists in their warm disputes in the sixties and seventies with Ferrara and other adversaries of the intervention of the state in economic affairs.

LUIGI EINAUDI

DECKER, SIR MATTHEW (1679-1749), merchant and economic pamphleteer. Decker was born in Amsterdam and settled in England in 1702. He became director of the East India Company and represented Bishops' Castle in the House of Commons.

Decker wrote two tracts: *Serious Considerations on the Several High Duties which the Nation in general, as well its Trade in particular labours under* (London 1743, 7th ed. 1756) and *An Essay on the Causes of the Decline of the Foreign Trade, consequently of the Value of the Lands of Britain and on the Means to restore both* (London 1744, 4th ed. Dublin 1751). In the former he advocates the raising of the whole revenue by means of a single excise duty on houses and claims for the tax the merits of justice, convenience and economy. In the latter he urges the replacement of all customs and excise duties by a single tax on the consumption of luxury goods—a kind of income tax with the merit, as it was conceived in the eighteenth century, that the taxpayer voluntarily assesses himself by choosing to consume such articles and to such an extent as he wishes. J. R. McCulloch on what appear insufficient grounds expressed some doubt as to Decker's authorship of this work. In both essays Decker argues strongly against restrictions on trade, emphasizing the significance of industry and trade to the welfare of the country. He would exempt the houses inhabited by the poor from all duties—not on grounds of social sympathy but because it would necessarily

lower their wages and consequently increase the competitive strength of British exports; he advocates the luxury tax because it would check luxury, the bane of virtue and industry. Decker's works reveal a forceful individualism. He was opposed to monopolies and bounties and was skeptical as to whether trade can ultimately be forced into "an unnatural channel," thus anticipating the discussion on the operation of natural laws in the economic world.

DECLARATION OF INDEPENDENCE. On June 7, 1776, R. H. Lee on behalf of the Virginia delegation presented to the Continental Congress three resolutions, the first of which stated that "these United Colonies are, and of right ought to be, free and independent States, [and] that they are absolved from all allegiance to the British Crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved" (*Journals of the Continental Congress*, ed. by C. F. Ford, 21 vols., Washington 1904-12, vol. v, p. 425). This resolution was voted by Congress on July 2 (*ibid.*, p. 507). Meantime, June 11, a committee composed of Jefferson, Adams, Franklin, Roger Sherman and R. R. Livingston was appointed to "prepare a declaration to the effect of the said first resolution . . ." (*ibid.*, p. 428-29, 431). Jefferson was authorized (for conflicting accounts on this point, *Works of John Adams*, ed. by C. F. Adams, 10 vols., Boston 1850-56, vol. ii, p. 512, 515; *Writings of Jefferson*, ed. by H. A. Washington, 9 vols., Washington 1853-54, vol. vii, p. 304) to prepare the preliminary draft. Many years later Jefferson said (*ibid.*, p. 305) that in preparing this draft he "turned to neither book nor pamphlet." But it appears that he had before him a paper written by himself entitled "Constitution of Virginia first ideas of Th. J.," from which some parts of the Declaration were copied verbatim (*Daughters of the American Revolution Magazine*, vol. lv, 1921, p. 363). The first draft, entitled "A Declaration by the Representatives of the United States of America, in general Congress assembled," was submitted by Jefferson to Franklin and Adams, both of whom made several corrections and additions. Thus amended it was submitted by the committee to Congress on June 28. Congress after making

further alterations and adding the resolution of July 2 finally voted the Declaration on July 4 (*Journals*, vol. v, p. 491, 510. For detailed study of the drafting, Becker, *Declaration of Independence*, ch. iv). The New York delegation, failing to obtain instructions, refrained from voting; but the Declaration was formally approved by the New York Provincial Congress on July 9 (*American Archives*, ed. by P. Force, 9 vols., Washington 1837-53, ser. v, vol. i, col. 1391). On July 19 Congress ordered that the Declaration be "engrossed on parchment with the title and stile of 'The Unanimous Declaration of the 13 United States of America,' and that the same when engrossed be signed by every member of Congress." The secret *Journal* for August 2 states: "The Declaration of Independence being engrossed and compared at the table was signed by the Members" (Hazelton, *Declaration of Independence*, ch. ix).

Aside from the last paragraph, which incorporates the resolution of independence voted on July 2, the Declaration consists of two parts: a preamble which formulates a general political philosophy and a list of grievances against the king of England designed to justify the separation from Great Britain.

The preamble states: "We hold these truths to be self-evident; that all men are created equal; that they are endowed by their Creator with certain unalienable Rights; that among these are Life, Liberty, and the pursuit of Happiness.—That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed.—That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or abolish it, and to institute new Government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness." Many years later John Adams wrote to Pickering: "There is not an idea in it [the Declaration] but what had been hackneyed in Congress for two years before" (*Works*, vol. ii, p. 514). R. H. Lee asserted that the ideas were taken from Locke. To these strictures Jefferson replied: "I did not consider it as any part of my charge to invent new ideas." The essential thing was to harmonize the "sentiments of the day, whether expressed in conversation, in letters, printed essays, or in the elementary books of public right, as Aristotle, Cicero, Locke, Sidney, etc." (*Writings*, vol. vii, p. 305-407). The preamble

was indeed no more than a brief and effective formulation of the generally accepted theories of natural right and popular sovereignty.

After affirming the abstract right of a people to abolish a form of government destructive of its natural rights the Declaration proceeded to enumerate the actions of the king which justified the colonies in resorting to that right in the present case. The grievances charged are stated in general terms: "He has refused his Assent to Laws, the most wholesome and necessary. . . . He has obstructed the Administration of Justice. . . . He has kept among us, in times of Peace, Standing Armies," etc. These charges, about twenty-four in number, refer to acts of the British government, but in the Declaration they are alleged against the king alone. It is significant that although for ten years past the colonial leaders had justified their resistance on the ground that Parliament had infringed their rights as British subjects the Declaration mentions neither Parliament nor the rights of British subjects. The explanation of this anomaly is to be found in the fact that as the controversy proceeded the colonial leaders modified their theory of colonial rights to suit the exigencies of the situation. In 1765 they were content to deny the right of Parliament to tax the colonies "internally," admitting its right to tax them "externally." In 1768-69 they denied the right of Parliament to tax the colonies in any way, admitting its right to legislate for them otherwise. But as early as 1768 Franklin shrewdly perceived that it would be difficult to maintain such fine distinctions, at least "clearly [and] with intelligible arguments. Something might be made of either of the extremes: that Parliament has a power to make *all laws* for us, or that it has a power to make *no laws* for us; and I think the arguments for the latter [are] more numerous and weighty, than those for the former" (*Writings of Franklin*, ed. by A. H. Smyth, 10 vols., New York 1905-07, vol. v, p. 115). In 1770 James Wilson prepared an elaborate pamphlet (not published till 1774) designed to prove that the colonies were in no way subject to Parliament, being bound to the empire only through voluntary allegiance to the king (*Works of James Wilson*, ed. by B. Wilson, 3 vols., Philadelphia 1804, vol. iii, p. 199). When the colonies decided upon a complete breach with Great Britain this was obviously the most convenient theory for justifying their action: if the colonies as free peoples had voluntarily acknowledged allegiance to the king, they might for good

Declaration of Independence — Declaration of London 47

reasons voluntarily withdraw it without laying themselves open to the charge of rebellion. In Jefferson's original draft of the Declaration this theory was explicitly suggested in the following passage: "We have reminded them [our British brethren] . . . that in constituting indeed our several forms of government, we had adopted one common king, thereby laying a foundation for perpetual league and amity with them; but that submission to their parliament was no part of our constitution." This passage, except the first four words, was struck out by Congress (Becker, p. 182); but the theory which it explicitly suggested was implicitly maintained throughout the Declaration. Parliament was not mentioned because, according to this theory, the colonies, not being subject to Parliament, had no quarrel with it. The rights of British subjects were not mentioned because, according to the theory, the colonies were not British subjects but free peoples—free peoples who had hitherto for good reasons acknowledged allegiance to the king, but who now withdrew that allegiance in view of the numerous acts of the king which have "in direct object the establishment of an absolute Tyranny over these states" (Becker, ch. iii).

The immediate importance of the Declaration of Independence was that it provided the patriot party with a most effective justification for the war with Great Britain. After the war was ended the major part of the Declaration (the list of grievances against the king) ceased to be of great significance. But the influence of the famous preamble long survived the events which gave birth to it. Like its French counterpart, the Declaration of the Rights of Man and the Citizen, it served discontented peoples throughout the world as a charter of human liberty. During the nineteenth century it was accepted by radical and revolutionary parties in every European country, in South America and in the United States as a classic and semi-sacred formulation of the fundamental democratic doctrines that governments derive "their just Powers from the consent of the governed," and that when "any form of Government becomes . . . destructive of the natural rights of man it is the Right of the People to alter or to abolish it" (Becker, ch. vi).

DECLARATION OF LONDON. This Declaration was an early attempt in the direction of codification of international maritime law by a conference of duly commissioned official delegates. Article 7 of the proposed convention for the establishment of an international court of appeal in matters of prize, The Hague, 1907, stated that in absence of treaty provisions the international prize court should apply "the Rules of International Law," and if no such rules existed the court was to give judgment "in accordance with the general principles of justice and equity." The question immediately arose as to what were the rules of international law.

Great Britain, realizing that naval policy and practise would be influenced by the wide divergence among nations upon questions of the law of maritime warfare, proposed in February, 1908, that a conference should be held with the object of agreeing "as to what are the generally recognized principles of international law" relating to prizes. The invitation to the conference was issued to the naval powers: Austria-Hungary, France, Germany, Italy, Japan, Russia, Spain and the United States of America. Later the Netherlands was with concurrence of the other powers asked to participate. The conference assembled in London December 4, 1908, and its sessions continued until February 26, 1909. More than one third of the delegates were naval officers of long experience. The American delegates were Rear Admiral Charles H. Stockton, U.S.N., and George Grafton Wilson. The delegates recognized the difficulties of formulating law adapted to the differing national legal systems represented in the conference. These difficulties were at once made evident by the Red Book presented to each delegate at the opening of the conference as a basis of discussion and containing the views of the several powers.

The program proposed for the conference had related to contraband, blockade, continuous voyage, destruction of neutral ships, un-

Encyclopaedia of the Social Sciences

neutral service, conversion of merchant vessels to vessels of war, transfer of flag, and nationality or domicile of owner. A degree of agreement was reached except upon the questions of conversion and domicile. Upon the other subjects the preliminary provision states: "The Signatory Powers are agreed in declaring that the rules contained in the following Chapters correspond in substance with the generally recognized principles of international law." In the final provisions, due to the fact that rules had been drawn in face of great diversity of usage, which sometimes necessitated a degree of compromise, it was agreed that "the provisions of the present Declaration form an indivisible whole" (article 65).

The Declaration of London was signed February 26, 1909. Naturally its seventy-one articles attempting to formulate rules on practise varying among nations met with much criticism, some of which, as was stated by Sir Edward Grey, showed little understanding of the Declaration and some a failure to read its articles. The Declaration was not ratified by the signatory powers and never became operative as law for these powers, although it was adopted in special cases, as in the Turco-Italian war of 1911.

It was endorsed by some states during the World War, as in the Chilean note of August 8, 1914, in regard to the observance of neutrality and in the note of Salvador of December 4, 1914; and some of the rules published by belligerents followed textually the Declaration of London. As the war progressed, however, the departure from the rules became wider, although throughout the war the Declaration remained a standard to which reference was made in testing rights of belligerents with regard to neutrals. The diplomatic representatives of the United States were instructed in August, 1914, to inquire whether the belligerent governments would agree that the rules of the Declaration of London should be applicable. Austria-Hungary and Germany agreed to apply the stipulations, conditioned on "like observance on the part of the enemy." The Allied Powers, following the lead of Great Britain, accepted the Declaration with reservations in regard to contraband and some modifications as to blockade. As by article 65 the Declaration was to form "an indivisible whole," the United States withdrew its suggestion that it be regarded as the accepted code.

The twenty-one articles of the Declaration relating to blockade (article 2 reaffirmed the

Declaration of Paris, 1856) were applied in some instances, as on the coasts of Africa, and disregarded in others, as on the coasts of Europe. Articles 22 to 44, which related to contraband and in the main followed the lists approved by the Hague Conference in 1907, were in face of World War conditions found to be too restricted; the lists of contraband became almost all inclusive, involving the abolition of the distinction between absolute and conditional contraband. Many other provisions of the Declaration of London were, however, cited in close decisions as evidence of the law and were followed widely in actual conduct of the war and in courts. Experience since 1909 has once more demonstrated that rules drawn up at one period may require modification in a codification adapted to changed conditions of later periods.

DECLARATION OF PARIS. The Treaty of Paris of 1856, which put an end to the Crimean War, was accepted "without enthusiasm, but without opposition." There was a lively hope that the Congress of Paris might do something worthy of world approval, and to this end it was proposed that it establish the bases of uniform law for maritime war as far as neutrals were concerned. The liberal treatment of neutrals during the war, due perhaps to geographical reasons rather than to changed attitude, seemed to lend approval to such principles prior to the deliberations which resulted in the Declaration of Paris as signed on April 16, 1856. This Declaration stated that the regrettable controversies as to the law of maritime warfare, uncertainty as to neutral rights and need of uniform doctrines were among the reasons which led the plenipotentiaries to adopt "the following solemn

Declaration of London — Declaration of the Rights of Man 49

declaration: 1. Privateering is, and remains, abolished; 2. Neutral flag covers enemy's goods, with the exception of contraband of war; 3. Neutral goods, with the exception of contraband of war, are not liable to capture under enemy's flag; 4. Blockades, in order to be binding, must be effective—that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy." It was further stated: "Convinced that the maxims which they now proclaim cannot but be received with gratitude by the whole world, the undersigned Plenipotentiaries doubt not that the efforts of their Governments to obtain the general adoption thereof will be crowned with full success."

Privateering had before 1856 come to be looked upon with growing disfavor. The doctrine, "free ships free goods, free goods always free," had been advocated for many years and had been embodied in some treaties. There was general consensus that paper blockades should no longer be tolerated. By a protocol the indivisibility of the four principles of the Declaration was to be maintained. Other states than Austria, France, Great Britain, Prussia, Russia, Sardinia and Turkey, the signatories, were invited to accede to the Declaration. Within a year more than forty states had signified their adherence; the United States of America, Spain and Mexico were among the powers which did not accede at that time although the latter two countries formally accepted the Declaration in 1908 and 1909 respectively. The correspondence of the United States on the subject indicated that the Declaration to be acceptable should provide for the general immunity of all innocent private property at sea, a contention which the signatories were unwilling to admit. The United States, however, observed the provisions of the Declaration during the American Civil War, even though the principle as to exemption of private property from capture was not embodied, and both the United States and Spain agreed to respect the Declaration in the Spanish American War of 1898.

Many objections have been raised against the Declaration of Paris. Some of these were on technical grounds, as, for example, that the negotiators at a peace congress had no authority to sign such a declaration. Other criticisms were to the effect that the Declaration of Paris multiplied "deplorable disputes"; it was regarded by Secretary Marcy as a half way measure and it was bitterly attacked in Great Britain on constitutional and other grounds. The use of subsi-

dized vessels and volunteer fleets was at times regarded as contrary to the provision of the Declaration of Paris in regard to privateering. When question was raised concerning the Prussian voluntary naval force in 1870, the law officers of the British crown found "substantial distinctions" between that force and the system of privateering, and gradually such vessels came to be considered as different from privateers. In the section of the Declaration regarding blockades the words "really to prevent access" have usually been interpreted as "rendering actually dangerous." The provisions relating to contraband although somewhat loosely drawn were generously accepted.

While some authorities do not regard the Declaration of Paris as setting forth principles of international law, nevertheless courts of the Allies and of the Central Powers during the World War rendered decisions based upon the Declaration. Sir Samuel Evans, president of the British Court in the prize case of the *Marie Glaeser*, September, 1914, in his comment said: "This Court accordingly ought to, and will, regard the Declaration of Paris, not only in the light of rules binding in the conduct of war, but as a recognized and acknowledged part of the Law of Nations, which alone is the law which this Court has to administer."

F., *The Declaration of Paris, 1856* (London 1919); Bowles, Thomas C., *The Declaration of Paris of 1856* (London 1900).

DECLARATION OF THE RIGHTS OF MAN AND THE CITIZEN. This Declaration in its final form was adopted by the French National Assembly on August 26, 1789, as a preamble to the new constitution. It had been drawn up in committee from twenty-one projects, the work of La Fayette, Mounier, Mirabeau, Rabaut Saint-Étienne and others. It contains seventeen articles and about five hundred words. Article 1 asserts that "men are born and remain free and equal in their rights." These "natural and imprescriptible rights of

man" are enumerated in article II as liberty, property, security and resistance to oppression. The rest of the Declaration further defines or guarantees these rights. Liberty is defined as "the power of doing whatever does not injure another." The individual is to be subject to uniform laws, in the making of which he may take part either directly or through his representatives; punishments obviously must be necessary; no one is to be molested for his opinions, even religious opinions; freedom of speech and of the press is guaranteed, subject to necessary legal restrictions; taxation must be equitably apportioned and must be determined by the citizens or their representatives; public officials may be called to account; property is an "inviolable and sacred right" and can only be taken from the individual in case of public necessity and with due indemnity. Freedom of association, it should be noticed, is not mentioned in the document.

There has been much controversy as to the origins, both proximate and ultimate, of this Declaration. Jellinek maintained that the immediate source was the American Declaration of Independence and more especially the bills of rights embodied in various state constitutions drawn up between 1776 and 1783, and that the ultimate source was the Calvinist idea of individual freedom of conscience against any earthly authority. Boutmy and others have, however, denied or minimized American and Calvinist influence and found the sources of the Declaration in the *Contrat social*, in the general philosophical movement of the eighteenth century and in practical necessity. That the American state constitutions were known to the alert bourgeois intellectuals of France—that is, to the kind of men who drew up the Declaration—is quite clear. They were circulated in pamphlet form in English and in translation as early as 1783. Franklin himself brought out an edition. Indeed, an anonymous pamphlet of 1791 (*Déclaration des droits de l'homme . . . comparée . . . principalement avec les déclarations des États-Unis de l'Amérique*, Paris, an troisième de la Liberté) anticipates Jellinek, compares the different declarations textually and concludes that the French have made succinct the diffuse American declarations. On the other hand, the makers of the French Declaration were certainly steeped in Rousseau. The controversy here has a twofold issue: is the *Contrat social* individualist or collectivist; is the French Declaration really concerned with protecting the individual or is it not rather a new

definition of the powers of the centralized state? To Jellinek the *Contrat social* is a collectivist work, where the individual gives himself over body and soul to society, and the Declaration of Rights is a great charter of individual sovereignty over a definite part of human consciousness and activity. To him, therefore, Rousseau could not have had a hand in the Declaration. To Redslob also the *Contrat social* is a collectivist work, but so too is the Declaration. Examined closely that document seems to him to make no Anglo-Saxon or Calvinist assertions that the individual is ultimately sovereign over part at least of his actions. It rather defines, in order to enlarge and make more efficient, the competence of the law. It destroys feudal variety to make way for modern centralization. To Boutmy the *Contrat social* is an individualist work because in it the individual surrenders himself not to a government but to a society embodied in a General Will; against the government the individual still needs protection and that protection is given him by the Declaration. Both Redslob and Boutmy, then, for very different reasons are agreed that the origins of the Declaration are in the *Contrat social*.

An even greater controversy has been carried on ever since 1789 as to the real value of the Declaration. Burke, Taine and many others have condemned the document as harmful, inexpedient and as bad politics. According to this school the Rights of Man were drawn up by metaphysicians for an abstract pattern man. They attempt to assert eternal, unvarying truths about human beings and to erect these truths into laws. Their methods are the methods of mathematics, not those of the experimental sciences. Since the truths deduced had no relation to concrete historical conditions, an attempt to apply them as laws designed to govern real men, creatures of habit and tradition, led to disaster. Old laws were discredited, the new laws could not possibly be obeyed and the anarchy of the first French Revolution was the result.

The Declaration has not, however, lacked defenders, from Thomas Paine to Bourgeois. Among the many lines this defense has taken two may be emphasized here. The first insists on the historical context of the Declaration. In 1789 France was inefficiently ruled by a feudally privileged court nobility and king, who had brought her close to bankruptcy. The Declaration was simply the assertion by a competent bourgeoisie that such privileges should no longer exist. Its phraseology may be abstract, since that

Declaration of the Rights of Man — Declaratory Judgment 51

was the fashion of the time, but each of its articles is really meant to protect the progressive, hard working and efficient modern Frenchman from exploitation by drones and sentimentalists. A second way of defense admits that the Declaration is concerned with universal truths and glories in the admission. These truths are not, however, empty mathematical formulae; they are ethical and hence pregnant truths. They are universal and, if you like, abstract, but only in the sense that the Decalogue and the golden rule are universal and abstract. They belong in politics because politics without ethics is inconceivable. They may indeed set up an ideal not immediately attainable, but the National Assembly none the less showed highest wisdom in asserting them.

The great historical influence of the Declaration is incontestable. It was the inspiration of most nineteenth century bills of rights in Europe, even in Prussia. The Weimar constitution has a bill of rights recognizably French in origin. Even the Bolsheviks in Russia, although they condemn the French Declaration of Rights and its imitations as mere tools to bourgeois supremacy, issued in January, 1918, a Declaration of the Rights of Workers and Exploited Peoples. In France the Declaration has played in the creation and maintenance of French nationalism a role analogous to that of the Declaration of Independence in the United States. It has been a symbol, a focus for patriotic sentiment, a sacred text of the cult of *la patrie*.

DECLARATORY JUDGMENT. The declaratory judgment may be defined as a binding determination or declaration of legal rights which will be made by the courts in cases where legal relations are in controversy. It differs from an executory judgment in the fact that it does not carry as an appendix a decree of execution. It declares the existence of a legal relation arising out of a legal instrument or transaction, and the plaintiff is not granted relief beyond that. Since it constitutes a finally binding determination of rights it can be rendered only when there are adverse parties in litigation and when all parties in interest have been cited. The court must be convinced that the declaratory judgment will serve a useful purpose in settling the issue, and its grant is therefore discretionary, a discretion which, however, by long practise has partly hardened into rule. These necessary conditions to a declaratory judgment sufficiently indicate that it differs radically from an advisory opinion, which binds no one, not even the court that renders it, and requires no adverse parties or litigated issues; and from the moot case, which involves issues that are fictitious, abstract, hypothetical, academic or dead.

The common law had long proceeded on the assumption that it was necessary to commit or threaten the immediate commission of a legal wrong before the protection of the courts could be invoked. It did not sufficiently recognize that injury or loss might be sustained by the mere assertion of claims which threw rights into doubt and uncertainty. Yet the fact is that there are numerous situations in which a legal declaration of rights can prevent damage—as when there is a dispute as to the existence of a marriage, as to the legitimacy or sanity of an individual, as to

the title to property or as to the construction of legal instruments such as contracts, deeds, leases or wills. Not only the freedom of action or disposition of private individuals but also the social equilibrium is disturbed when parties have to act at their peril upon their own interpretation of their supposed rights as to questions of civil status or property rights. It is to remedy this situation that the declaratory judgment has been adopted as an efficient instrument of preventive justice in the codes of procedure of many civilized countries. It also performs other functions by enabling issues to be narrowed and quickly determined.

The principle of the declaratory judgment is not new and has been often recognized where ideas of equity have prevailed in legal systems. The Roman law was familiar in a limited way with the declaratory function of courts in the *actiones praejudiciales*. The declaratory judgment was used in the Middle Ages and from France spread to Scotland, where it has been in use since the sixteenth century. In the system of the common law the courts of equity have long granted some forms of preventive relief, as when they have allowed actions to quiet title to property or to construe wills or declare a marriage or a legal instrument void. These forms of equitable relief have, however, not been coextensive with the benefits of the declaratory judgment, and in 1852 the latter was formally introduced into England, receiving constant extension there, notably in the court rules of 1883 and 1893. Approximately two thirds of English cases in equity now arise on actions for a declaratory judgment. It is now used in practically all the British colonies and possessions, notably in India. In 1877 it was adopted into the German code of civil procedure and it is also in force in most of central Europe.

Since 1919 the movement for the declaratory judgment has spread rapidly in the United States. About half of the states have now enacted authorizing statutes, of which some fourteen have adopted the Uniform Declaratory Judgments Act. The reform has been endorsed by most state bar associations and by judges who have had practical experience with it. Some 300 decisions of the higher state courts construing the declaratory judgment have been recorded up to 1930. On the whole, the liberal views of the English courts as to practise have been followed. Only two courts of the many who have passed on the question have thought the declaratory

judgment unconstitutional: the Michigan Supreme Court in *Anway v. Grand Rapids Ry. Co.* [211 Mich. 592 (1920)] and the United States Supreme Court in various dicta, for instance in *Liberty Warehouse Co. et al v. Grannis* [273 U. S. 70 (1926)] and in *Willing v. Chicago Auditorium Association* [277 U. S. 274 (1927)], which intimate that an action for a declaratory judgment would not be regarded as presenting a "case or controversy" within the meaning of the constitution. It has been assumed in these cases that the declaratory judgment involved either an advisory opinion rendered without the presence of litigating parties contesting a genuine issue or else a moot case. That such misconceptions cannot prevail, however, is shown by the fact that the Michigan Supreme Court overruled the *Anway* case in 1930 [*Washington-Detroit Theatre Co. v. Moore*, 249 Mich. 673 (1930)]. The United States Supreme Court now stands alone. Its attitude has prevented the enactment of a federal declaratory judgments act which has twice passed the House of Representatives. However, if one may judge from a recent dictum of the Supreme Court in *Piedmont and Northern Ry. Co. et al. v. U. S. et al.* [280 U. S. 469 (1930)] to the effect that there is as yet no *statutory* authority in the federal courts to render declaratory judgments (which of course is true), it is possible that the court may yet withdraw from its position and that a federal statute will before long be enacted.

Since the principal purpose of the declaratory judgment is to enable disputed rights to be litigated without the necessity of first doing irremediable damage, it may be said to be especially necessary in an industrial society which operates under long term contracts and where social and economic relations are becoming ever more complicated. As a procedure it represents a response to the demand for security in legal relationships. It merely extends to new fields and to all legal relations a judicial function which was well recognized in older forms of action.

DE FACTO GOVERNMENT. A government *de facto*, as distinct from a government *de jure*, is a government which has gained control of a state or a portion of a state by overthrowing the regularly constituted authorities but has not as yet been recognized as legally qualified to represent the state in which it has assumed power. It may come into existence as a result of revolutionary action within the state or as a consequence of hostile occupation by a foreign army. It cannot be a mere pretender to power but must be actually in control of people and territory. The so-called Irish Republic, for example, was never more than a revolutionary organization continually on the run [*cf.* *Irish Free State v. Guaranty Safe Deposit Co.*, 222 N. Y. S. 18: (1927)]. On the other hand, the Confederate States of America, the Paris Commune of 1871 and the Bavarian and Hungarian soviets of 1919, although never recognized by the *de jure* authorities or by foreign states, exercised effective control in their respective territories during a number of months and were therefore genuine *de facto* governments. Similarly, the German military authorities constituted the *de facto* government of Belgium during the Great War. The British forces which occupied the town of Castine in northern Maine from September, 1814, to February, 1815, formed the *de facto* government of that town.

In the instances cited, both of military occupation and of revolution or insurrection, the *de jure* authorities eventually recovered control and thus terminated the *de facto* regime. In the event of its success, however, such a regime may become the *de jure* government by securing recognition as such. The revolutionary governments formed in Argentina, Peru and Bolivia in the summer of 1930 and headed respectively by President Uriburu, President Sanchez Cerro and General Blanco Galindo were granted diplomatic recognition by the United States and other powers in September of that year and thus became *de jure* governments for those countries extending recognition. In such instances of successful revolution the legal status of the new regime, as far as other states are concerned, depends upon the action of the latter's political authorities in granting or withholding recognition.

The existence of a *de facto* government gives rise to a number of politico-legal problems. There arises first the question of the validity of the internal acts of a *de facto* government in relation to subsequent *de jure* governments and to outside states. If the *de facto* government subsequently secures *de jure* status, the problem is simple. Since recognition is retroactive to the time of the establishment of the government or state recognized, all its acts from its inception are validated for foreign states and for its possible successors. If, however, the *de facto* regime is replaced by the former *de jure* authorities, the situation is more complex. The general rule followed by American courts and most foreign tribunals is that all acts of a *de facto* government having to do with police protection, contracts, property rights, marriages, estates and the like remain valid but that acts in support of rebellion are void. Following the American Civil War the federal courts upheld the validity of most of the judicial and legislative acts of the seceded state governments [*Texas v. White*, 74 U. S. 700 (1868); *Horn v. Lockhart et al.*, 84 U. S. 570 (1873)]. The acts of the central Confederate government, however, were held to be without legal effect on the ground that they were all in support of an unsuccessful insurrection against the United States [*Hickman v. Jones*, 76 U. S. 197 (1869); *Williams v. Bruffy*, 96 U. S. 176 (1877)]. In the case of the Russian Soviet government European courts generally held its acts, such as its nationalization decrees, invalid within their own jurisdictions prior to recognition but conceded their validity after recognition was accorded [*Aksionairnoye Obschestvo A. M. Luther v. Sagor & Co.*, (1921) 1 K. B. 456 and (1921) 3 K. B. 532]. There has been a tendency, however, to grant the validity of acts of a *de facto* government, even prior to its recognition, to the degree necessary to avoid injustice to innocent parties [*Russian Reinsurance Co. v. Stoddard*, 240 N. Y. 149 (1925)]. These problems have become acute in American courts because of the prolonged refusal of the Department of State to extend recognition to the *de facto* government of Russia. The acts of that government are nullities and it is unable to appear in American courts, which are obliged to deal only with the agents of the provisional or Kerensky government, defunct since 1917, as representatives of the Russian state.

A somewhat different type of problem centers about the power of *de facto* governments to bind the state and succeeding governments by their

acts and obligations. In general, a de facto government in firm control of the entire state can bind it by its treaties and contracts [Phillips v. Payne, 92 U. S. 130 (1875)]. Succeeding de jure governments usually recognize their liability for injuries to persons or property of foreign nationals arising out of the acts of de facto authorities. Loans contracted for legitimate governmental purposes are binding [Keith v. Clark, 97 U. S. 454 (1878)]; contracts in aid of revolution, on the other hand, are void [Kennett et al. v. Chambers, 55 U. S. 38 (1852)]. In Latin America succeeding governments have occasionally nullified the acts of their de facto predecessors on the ground of usurpation or illegitimacy. When such action affects rights of foreign nationals, their states uniformly hold the government in question liable on the principle of state continuity. Where the de facto authorities are only in local control there is considerable question of their power to bind the state. But there is general agreement on the international responsibility of the state, and therefore of succeeding or restored governments, for the acts of a general de facto government.

DEFOE, DANIEL (c. 1659-1731), English novelist and publicist. In addition to being the founder of popular journalism and the creator in English of the novel of character and adventure Defoe was also the first social reformer of the modern age and the author of numerous pamphlets of an occasional nature dealing with

contemporary political and economic problems. To the fervor of a Puritan moralist he joined a genius for observing and interpreting in plain language the daily concerns of business life and family affairs. With incessant curiosity, with stores of information drawn from study, men and travel, with unsurpassed versatility of interests and with a deep instinct for speculation on ways of human progress he proved that the true journalist is the historian of his own times and the guide for current living. As editor of the *Review* (1704-12) he divorced journalism from the narrow partisanship or literary preoccupations of previous periodicals and made his paper a forum of debate on politics, economics, religion and morals. He abandoned academic themes for life itself, discovered that gossip and human interest are the leaven of news, provoked readers to write letters to the editor and invented that timely comment on life which we now call the editorial. His correspondence from all over England and Scotland showed a happy combination of precise data, local color and stimulating comment. To his genius as a journalist we must add his consuming interest in the welfare of plain people. Poverty, unemployment, old age, discrimination against women, moved his heart; nothing was too humble or sordid to engage his interest, whether the training of children, the control of servants, the abuses of sex in marriage, the London police, obscene books or prostitution. In his early *An Essay upon Projects* (London 1697) his modernity is revealed by his consideration of education, insurance, pensions and insane asylums. His pamphlet *Giving Alms No Charity* (London 1704) argues that relief works merely divert capital from one channel to another. In economics he considered the problem of state credit and recommended the establishment of national banks; his own experiences in business and speculation inspired studies of England's overseas commerce; he foresaw the importance of free trade and the coming competition of the colonies. His scrutiny of the salesmanship of his time is based on the bitter logic of success by any means. For the economic historian *A Tour thro' . . . Great Britain* (3 vols., London 1724-27; ed. by G. D. H. Cole, 2 vols., London 1928) is a priceless source book of information on fairs, industry, resources, trade methods and statistics. Defoe has been rightly called "the greatest of plebeian geniuses." He believed in democracy and religious toleration and the melioration of life through education. Although far from being a constructive political

philosopher he exerted a strong influence on political thinking in England by his popularization of Locke's recent works. His pen was valiant on the side of the plain people and his fame was secure even without the gift of his immortal novel.

DE FOREST, ROBERT WEEKS (1848-1931), American philanthropist. De Forest, a lawyer and capitalist, was the chief figure of his generation in the field of social service. As the leadership in social work passed from philanthropist to professional worker, he took on the activities of the latter without stinting his function as contributor. He was sensitive to social needs before they became articulate and plunged into the task of meeting them with a hard headed and practical enthusiasm, organizing and conducting militant campaigns and using his entrée to wealthy society to draft the cooperation of large resources and many persons. As a coworker of Josephine Shaw Lowell he helped organize the Charity Organization Society of New York City—one of the pioneer agencies of this type in America—and as its president from 1888 to his death largely guided its development. An early advocate of housing reform, he was chairman of the New York State Tenement House Commission in 1900 and first commissioner of the New York City Tenement House Department in 1902-03. His advice led to the establishment of the Russell Sage Foundation, one of whose first grants was to the famous Pittsburgh Survey of 1907-09, and he was president of the Foundation until his death. He was also an active leader and officer of the Metropolitan Museum of Art, the American Federation of Art, the Welfare Council of New York City, the American Red Cross, the National Housing Associa-

tion, the National Conference of Social Work, the Provident Loan Association and other civic and welfare organizations.

PHILIP KLEIN

DEGENERATION signifies progressive deterioration the final result of which is a state of degeneracy. Degeneration may occur in the hereditary traits of a family or a race, in the physical, mental or moral traits of an individual or in social organization or culture. The term is popularly and loosely used in such a way as to identify the results of degeneration with behavior which is merely abnormal, defective or deficient. Before 1850 numerous writers used it to designate various departures from the normal, with the range of normal variation defined subjectively rather than objectively. At that time, moreover, religious beliefs, especially the belief in the fall of man, caused some writers to view all mankind as degenerate and to consider mental deficiencies or abnormalities as due to punishment for sin or to demoniacal possession. Before the writings of the social evolutionists changed the outlook of students of primitive society the dominant opinion was that primitive mentality represented mental degeneration, a hypothesis recently revived by Allier. Morel in his epoch making treatise looked upon primitive man as distinctly inferior to modern man and upon degeneration as hereditary physical or mental deterioration extending over two or more generations. He suggested that modern degeneration might be due to the emergence of primitive traits but rejected the view that it was due to atavism. Moreau de Tours identified degeneration with mental abnormality and pathology and their physical accompaniments. Subsequent writers so broadened the concept that it included nearly every anomaly, physical, mental or moral. Many students busied themselves devising categories of degenerates and lists of stigmata for their identification. By the early eighties the idea of degeneration had been generally accepted in biology, anthropology, criminology, psychiatry and medicine. While interest centered primarily in the feeble-minded, insane, epileptic and criminal, the designation was extended to include egotists, clever liars, eccentrics and men of genius. Degeneration was generally conceived to be progressive hereditary deterioration often culminating in sterility, but the term was also applied to a wide range of individual

abnormalities. Knowledge of causal factors involved in degeneration was not only deficient but was vitiated by a general belief in the inheritance of acquired characteristics and an implicit acceptance of von Baer's doctrine of organic development and of the concept of embryological recapitulation of racial evolution. Degeneration was therefore variously conceived in terms of atavism, of arrested development and of parasitism.

The anthropological school of criminologists accepted most of these views. While Lombroso originally held the "born criminal" to be an atavism he later attributed great influence to arrested development and disease and ended by regarding atavism itself as a form of degeneration. His school considered the criminal sometimes a savage, sometimes a child and sometimes merely a member of uncultured social classes. It gave names to special types of so-called degenerates, designating as "infantiles" those whose degeneracy was due to arrest of development at puberty, as "effeminates" those believed to be offspring of tuberculous or alcoholic parents and as "seniles" those in whom involution had occurred prematurely. It is to be held largely responsible for the popular view that the terms "criminal" and "degenerate" are synonymous and that aments, epileptics, neurotics and psychotics are likewise degenerate. Members of this school and their predecessors represent an early stage in the development of criminology and psychiatry and their terminology has been largely superseded in scientific writings by more apt designations.

The doctrine of degeneration was taken over by Max Nordau, a disciple of Lombroso, who in his *Entartung* (2 vols., 2nd ed. Berlin 1893; tr. as *Degeneration*, 4th ed. New York 1895) declared that "degenerates are not always criminals, prostitutes, anarchists and pronounced lunatics; they are often authors and artists" (vol. i, p. vii). He saw degeneration in nearly every phase of European culture, especially among the upper urban classes, in the character of dress, manners, morals, taste, art, poetry, fiction and philosophy. He attributed what he considered the temporary degeneration of his time to nervous exhaustion and mental aberration resulting from too rapid social evolution. He singled out for special attack the English pre-Raphaelites, the French symbolist poets, Tolstoy, Wagner, Ibsen, Nietzsche, Zola and their respective schools of thought. These he viewed variously as examples of degenerate mysticism, of egomania and of decadent

realism; as seekers after sensationalism, ego exploitation, lubricity, vulgarity and ugliness. Nordau's work found many imitators, but most of the men whom he criticized have attained places of distinction in artistic and literary history. Since there is no objective standard whereby degeneration in the immaterial phases of culture can be readily determined, assertions of it usually resolve themselves into statements of taste and subjective standards of value. Each new movement in painting, sculpture, architecture, music, poetry and the novel as well as in sex morality and religion has been denounced as degenerate by various writers. Prophets of the decline of European culture have flourished, especially among the Aryanists and Nordicists; in their wake has followed Oswald Spengler, who in his *Der Untergang des Abendlandes* (2 vols., rev. ed. Munich 1922-23; tr. by C. F. Atkinson as *Decline of the West*, New York 1926-28) reaches the same general conclusion by an impressive rationalization of universal history.

While the word degeneration is still loosely used, its current biological usage clearly signifies progressive hereditary deterioration of structure in the evolution of a species. Such degeneration is found wherever an organism fails to attain the complexity of development promised by its ancestral or its embryological stages. The evolution of certain parasites, for example, reveals a progressive simplification of structure, often of the entire organism, sometimes accompanied by the development of special organs for attachment to the host. Degeneration may also affect single organs, which then become atrophied or vestigial. Biological degeneration is a result of adaptation to relatively simple conditions of existence which are brought about by the same processes that produce evolution in general. Biological degeneration is thus clearly distinguished from atavism.

In medical pathology the term is used in two distinct senses. It is employed to characterize a progressive deterioration of cellular structure in consequence of abnormal chemical action within the individual organism which may lead to cellular destruction, as in tuberculosis, or to cellular homogeneity in consequence of chemical infiltration or substitution, as in fatty, albuminous, calcareous or other types of degeneration of an organ. This category includes a great variety of cases due to malnutrition, alcohol, drugs, communicable diseases, fatigue, nervous exhaustion, physical injury during gestation, birth or matu-

rity, shell shock and psychosis. The second broad class of pathological cases includes all those where parental degeneration in the above sense is believed to produce similar or related deleterious effects on the offspring. Causal sequences are not entirely clear in all these cases. The progress of research has tended to discredit belief in the inheritance of bodily modification due to use, habit, injury or disease. There are at present no grounds for supposing that poverty, malnutrition, excessive fatigue, nervous exhaustion, physical injury, shell shock and similar parental modifications have any effect on the genetic constitution of offspring. The cases usually cited seem explicable on the basis of gene mutation, new genetic combinations or selective elimination of non-adapted types. In experiments on animals gene defects appear under both good and bad living conditions, and the defects may or may not bear any observable relation to the conditions. The only established causes of mutational change are radiations, especially X-rays, but the experimental evidence thus far relating to mammals does not clearly establish the contention that defects associated with X-ray radiation are due to the rays; they may be due to recessive defective genes already present. The claim that alcohol results in degeneration of stock seems to be controverted by controlled experiments on fowls, rats and guinea pigs which show that alcohol destroys the weaker germs, producing in the end a more vigorous stock through selective elimination. Alcohol may be a factor in individual degeneration both physically and mentally; it may be a factor in poverty and family degradation; but that it is a factor in biological degeneration of stock is extremely doubtful.

The literatures of Aryanism and Nordicism and of eugenics have stressed the probability of a present degeneration of racial quality among western nations. The former writers base their views largely on belief in the gradual inundation of supposedly pure Nordic types by the westward push of Slavic elements and the assumed deleterious effects of race mixture. Both schools argue that beneficial natural selection has been checked through the preservation of weaker strains by medical science and humanitarianism and reversed through the relatively lower fertility of the more able strains, biological ability being measured in terms of cultural achievement. Both have argued that degeneration of stock would involve a deterioration of culture. Persons who are defective or abnormal in any

way through inheritance are not degenerates; but if their stock increases relatively to others and the inheritance of the defect persists, racial degeneration will result. The increased frequency of death from degenerative diseases of the vital organs, which is attributed by some writers to reduced lethal selection during early years of life, may indicate some decline in the average vitality of the population due to adaptation to easier conditions of existence. It is not impossible that a rich and humane civilization may permit the undue multiplication of defective and parasitic types ill adapted to more primitive societies.

DEGENKOLB, HEINRICH (1832-1909). German jurist. After attending various German universities Degenkolb became professor of law at Berlin, Freiburg, Tübingen and Leipzig successively. A part of his academic career was spent in foreign countries, particularly France

abnormalities. Knowledge of causal factors involved in degeneration was not only deficient but was vitiated by a general belief in the inheritance of acquired characteristics and an implicit acceptance of von Baer's doctrine of organic development and of the concept of embryological recapitulation of racial evolution. Degeneration was therefore variously conceived in terms of atavism, of arrested development and of parasitism.

The anthropological school of criminologists accepted most of these views. While Lombroso originally held the "born criminal" to be an atavism he later attributed great influence to arrested development and disease and ended by regarding atavism itself as a form of degeneration. His school considered the criminal sometimes a savage, sometimes a child and sometimes merely a member of uncultured social classes. It gave names to special types of so-called degenerates, designating as "infantiles" those whose degeneracy was due to arrest of development at puberty, as "effeminate" those believed to be offspring of tuberculous or alcoholic parents and as "seniles" those in whom involution had occurred prematurely. It is to be held largely responsible for the popular view that the terms "criminal" and "degenerate" are synonymous and that aments, epileptics, neurotics and psychotics are likewise degenerate. Members of this school and their predecessors represent an early stage in the development of criminology and psychiatry and their terminology has been largely superseded in scientific writings by more apt designations.

The doctrine of degeneration was taken over by Max Nordau, a disciple of Lombroso, who in his *Entartung* (2 vols., 2nd ed. Berlin 1893; tr. as *Degeneration*, 4th ed. New York 1895) declared that "degenerates are not always criminals, prostitutes, anarchists and pronounced lunatics; they are often authors and artists" (vol. i, p. vii). He saw degeneration in nearly every phase of European culture, especially among the upper urban classes, in the character of dress, manners, morals, taste, art, poetry, fiction and philosophy. He attributed what he considered the temporary degeneration of his time to nervous exhaustion and mental aberration resulting from too rapid social evolution. While the word degeneration is still loosely used, its current biological usage clearly signifies progressive hereditary deterioration of structure in the evolution of a species. Such degeneration is found wherever an organism fails to attain the complexity of development promised by its ancestral or its embryological stages. The evolution of certain parasites, for example, reveals a progressive simplification of structure, often of the entire organism, sometimes accompanied by the development of special organs for attachment to the host. Degeneration may also affect single organs, which then become atrophied or vestigial. Biological degeneration is a result of adaptation to relatively simple conditions of existence which are brought about by the same processes that produce evolution in general. Biological degeneration is thus clearly distinguished from atavism.

In medical pathology the term is used in two distinct senses. It is employed to characterize a progressive deterioration of cellular structure in consequence of abnormal chemical action within the individual organism which may lead to cellular destruction, as in tuberculosis, or to cellular homogeneity in consequence of chemical infiltration or substitution, as in fatty, albuminous, calcareous or other types of degeneration of an organ. This category includes a great variety of cases due to malnutrition, alcohol, drugs, communicable diseases, fatigue, nervous exhaustion, physical injury during gestation, birth or matu-

rity, shell shock and psychosis. The second broad class of pathological cases includes all those where parental degeneration in the above sense is believed to produce similar or related deleterious effects on the offspring. Causal sequences are not entirely clear in all these cases. The progress of research has tended to discredit belief in the inheritance of bodily modification due to use, habit, injury or disease. There are at present no grounds for supposing that poverty, malnutrition, excessive fatigue, nervous exhaustion, physical injury, shell shock and similar parental modifications have any effect on the genetic constitution of offspring. The cases usually cited seem explicable on the basis of gene mutation, new genetic combinations or selective elimination of non-adapted types. In experiments on animals gene defects appear under both good and bad living conditions, and the defects may or may not bear any observable relation to the conditions. The only established causes of mutational change are radiations, especially X-rays, but the experimental evidence thus far relating to mammals does not clearly establish the contention that defects associated with X-ray radiation are due to the rays; they may be due to recessive defective genes already present. The claim that alcohol results in degeneration of stock seems to be controverted by controlled experiments on fowls, rats and guinea pigs which show that alcohol destroys the weaker germs, producing in the end a more vigorous stock through selective elimination. Alcohol may be a factor in individual degeneration both physically and mentally; it may be a factor in poverty and family degradation; but that it is a factor in biological degeneration of stock is extremely doubtful.

The literatures of Aryanism and Nordicism and of eugenics have stressed the probability of a present degeneration of racial quality among western nations. The former writers base their views largely on belief in the gradual inundation of supposedly pure Nordic types by the westward push of Slavic elements and the assumed deleterious effects of race mixture. Both schools argue that beneficial natural selection has been checked through the preservation of weaker strains by medical science and humanitarianism and reversed through the relatively lower fertility of the more able strains, biological ability being measured in terms of cultural achievement. Both have argued that degeneration of stock would involve a deterioration of culture. Persons who are defective or abnormal in any

way through inheritance are not degenerates; but if their stock increases relatively to others and the inheritance of the defect persists, racial degeneration will result. The increased frequency of death from degenerative diseases of the vital organs, which is attributed by some writers to reduced lethal selection during early years of life, may indicate some decline in the average vitality of the population due to adaptation to easier conditions of existence. It is not impossible that a rich and humane civilization may permit the undue multiplication of defective and parasitic types ill adapted to more primitive societies.

DEGENKOLB, HEINRICH (1832-1909). German jurist. After attending various German universities Degenkolb became professor of law at Berlin, Freiburg, Tübingen and Leipsic successively. A part of his academic career was spent in foreign countries, particularly France

abnormalities. Knowledge of causal factors involved in degeneration was not only deficient but was vitiated by a general belief in the inheritance of acquired characteristics and an implicit acceptance of von Baer's doctrine of organic development and of the concept of embryological recapitulation of racial evolution. Degeneration was therefore variously conceived in terms of atavism, of arrested development and of parasitism.

The anthropological school of criminologists accepted most of these views. While Lombroso originally held the "born criminal" to be an atavism he later attributed great influence to arrested development and disease and ended by regarding atavism itself as a form of degeneration. His school considered the criminal sometimes a savage, sometimes a child and sometimes merely a member of uncultured social classes. It gave names to special types of so-called degenerates, designating as "infantiles" those whose degeneracy was due to arrest of development at puberty, as "effeminate" those believed to be offspring of tuberculous or alcoholic parents and as "seniles" those in whom involution had occurred prematurely. It is to be held largely responsible for the popular view that the terms "criminal" and "degenerate" are synonymous and that aments, epileptics, neurotics and psychotics are likewise degenerate. Members of this school and their predecessors represent an early stage in the development of criminology and psychiatry and their terminology has been largely superseded in scientific writings by more apt designations.

The doctrine of degeneration was taken over by Max Nordau, a disciple of Lombroso, who in his *Entartung* (2 vols., 2nd ed. Berlin 1893; tr. as *Degeneration*, 4th ed. New York 1895) declared that "degenerates are not always criminals, prostitutes, anarchists and pronounced lunatics; they are often authors and artists" (vol. i, p. vii). He saw degeneration in nearly every phase of European culture, especially among the upper urban classes, in the character of dress, manners, morals, taste, art, poetry, fiction and philosophy. He attributed what he considered the temporary degeneration of his time to nervous exhaustion and mental aberration resulting from too rapid social evolution. He singled out for special attack the English pre-Raphaelites, the French symbolist poets, Tolstoy, Wagner, Ibsen, Nietzsche, Zola and their respective schools of thought. These he viewed variously as examples of degenerate mysticism, of egomania and of decadent

realism; as seekers after sensationalism, ego exploitation, lubricity, vulgarity and ugliness. Nordau's work found many imitators, but most of the men whom he criticized have attained places of distinction in artistic and literary history. Since there is no objective standard whereby degeneration in the immaterial phases of culture can be readily determined, assertions of it usually resolve themselves into statements of taste and subjective standards of value. Each new movement in painting, sculpture, architecture, music, poetry and the novel as well as in sex morality and religion has been denounced as degenerate by various writers. Prophets of the decline of European culture have flourished, especially among the Aryanists and Nordicists; in their wake has followed Oswald Spengler, who in his *Der Untergang des Abendlandes* (2 vols., rev. ed. Munich 1922-23; tr. by C. F. Atkinson as *Decline of the West*, New York 1926-28) reaches the same general conclusion by an impressive rationalization of universal history.

While the word degeneration is still loosely used, its current biological usage clearly signifies progressive hereditary deterioration of structure in the evolution of a species. Such degeneration is found wherever an organism fails to attain the complexity of development promised by its ancestral or its embryological stages. The evolution of certain parasites, for example, reveals a progressive simplification of structure, often of the entire organism, sometimes accompanied by the development of special organs for attachment to the host. Degeneration may also affect single organs, which then become atrophied or vestigial. Biological degeneration is a result of adaptation to relatively simple conditions of existence which are brought about by the same processes that produce evolution in general. Biological degeneration is thus clearly distinguished from atavism.

In medical pathology the term is used in two distinct senses. It is employed to characterize a progressive deterioration of cellular structure in consequence of abnormal chemical action within the individual organism which may lead to cellular destruction, as in tuberculosis, or to cellular homogeneity in consequence of chemical infiltration or substitution, as in fatty, albuminous, calcareous or other types of degeneration of an organ. This category includes a great variety of cases due to malnutrition, alcohol, drugs, communicable diseases, fatigue, nervous exhaustion, physical injury during gestation, birth or matu-

rity, shell shock and psychosis. The second broad class of pathological cases includes all those where parental degeneration in the above sense is believed to produce similar or related deleterious effects on the offspring. Causal sequences are not entirely clear in all these cases. The progress of research has tended to discredit belief in the inheritance of bodily modification due to use, habit, injury or disease. There are at present no grounds for supposing that poverty, malnutrition, excessive fatigue, nervous exhaustion, physical injury, shell shock and similar parental modifications have any effect on the genetic constitution of offspring. The cases usually cited seem explicable on the basis of gene mutation, new genetic combinations or selective elimination of non-adapted types. In experiments on animals gene defects appear under both good and bad living conditions, and the defects may or may not bear any observable relation to the conditions. The only established causes of mutational change are radiations, especially X-rays, but the experimental evidence thus far relating to mammals does not clearly establish the contention that defects associated with X-ray radiation are due to the rays; they may be due to recessive defective genes already present. The claim that alcohol results in degeneration of stock seems to be controverted by controlled experiments on fowls, rats and guinea pigs which show that alcohol destroys the weaker germs, producing in the end a more vigorous stock through selective elimination. Alcohol may be a factor in individual degeneration both physically and mentally; it may be a factor in poverty and family degradation; but that it is a factor in biological degeneration of stock is extremely doubtful.

The literatures of Aryanism and Nordicism and of eugenics have stressed the probability of a present degeneration of racial quality among western nations. The former writers base their views largely on belief in the gradual inundation of supposedly pure Nordic types by the westward push of Slavic elements and the assumed deleterious effects of race mixture. DEGENKOLB, HEINRICH (1832-1909). German jurist. After attending various German universities Degenkolb became professor of law at Berlin, Freiburg, Tübingen and Leipsic successively. A part of his academic career was spent in foreign countries, particularly France

and Italy. From 1879 to 1893 Degenkolb was one of the editors of the *Archiv für die civilistische Praxis*.

His earliest researches were legal and historical in character and clearly show Mommsen's influence. The more significant of them are *Die Lex Hieronica und das Pfändungsrecht der Steuerpächter* (Berlin 1861) and *Platzrecht und Miethe; Beiträge zur ihrer Geschichte und Theorie* (Berlin 1867).

Degenkolb later became interested in modern law, particularly in the fields of contracts and damages, but instead of playing an important part in the drafting of the German civil code, as he might have done, he was decidedly hostile to the project and remained so after its execution. In 1877 he entered the field of civil procedure, in which his most noteworthy contributions to legal science were made, with his *Einlassungszwang und Urteilsnorm* (Leipsic 1877). His opposition, expressed in this work, to the Wach-Hellwig theory of the relationship between state protection and private causes of action was not entirely successful but was the foundation for his subsequent researches on declaratory actions. Degenkolb's position as a teacher and his procedural treatises, particularly the *Beiträge zum Zivilprozess* (Leipsic 1905), which contained studies of the concept of the cause of action, of confession of judgment and of the Roman law referee in bankruptcy, make his work with that of Oskar Bülow the foundation upon which the present German procedural system is built.

A. ARTHUR SCHILLER

DE GREEF, GUILLAUME (1842-1924), Belgian sociologist. Originally a barrister and editor of radical journals, de Greef occupied for some years the first chair of sociology at the Université Libre de Bruxelles, where he became known as the leading sociologist of the classificatory type. Aroused by the dismissal of the geographer Reclus on a charge of anarchism de Greef led an exodus from the university and founded the Université Nouvelle, committed to freedom of thought and to close cooperation with the workers' educational movement. There he taught quietly until his death. Besides numerous and repetitious works on formal sociology de Greef wrote works on occupational representation, on a project for a state bank of free credit, on government ownership and group operation of coal mines by workers and technicians and on

trade unionism. In his theoretical writings, abstract though they seem, de Greef was attempting to erect into a valid scientific system what was later to become syndicalism. He drew upon Comte and Spencer for the framework of his system, but the inspiration for his content came from Proudhon. His elaborate "hierarchy of the seven social factors," running from the economic up to the political—avowedly an extension of Comte's classification of the sciences—was intended to show the basic and eternally penetrating nature of economic influences; his Spencerian formula of progress in terms of increasing differentiation and coordination of parts culminated in the Proudhonian concept of "contractual," voluntaristic association; his original theory of frontiers illustrated the growth of "contractual" ties across even national boundaries. De Greef believed that the essence of the social process is group pressure and accommodation; at first this is authoritarian, but with increasing contacts, especially of an economic nature, it breaks up into *débat*, higgling, of equal interest groups. Some forms of association pass from the "contractual" into the habitual stage, while others are in the process of becoming "contractual." "Natural" interest groups are ultimately occupational groups.

DEIFICATION is here defined as a conceptual union between god and man which leads to the treatment of the man as equivalent to the god. Other types of union historically called deification, such as that established between God and the communicant in the Christian communion, are excluded, however, only because it is necessary to limit the subject.

Some would limit deification to those cases in which the man is in himself a god, not merely the *locum tenens* of a god. These are cases where the doctrine of the divinity of kings has been pushed to an extreme and which ap-

pear usually at the acme of monarchical power and herald its decline. This undue limitation has led to much argument concerning the existence of divine kings. Except in the exaggerations mentioned the people are perfectly aware that the god and the man are distinct, that the god is in the man and that worship is addressed to the god through the man. The position of the man is analogous to that of a colonial governor who is regarded as the king's substitute and as such enjoys many of the king's honors, although every one realizes that he is not the king.

Gibbon's misconception of deification as a "servile and impious mode of adulation" still prevails. Smith's *Dictionary of Greek and Roman Antiquities* similarly declares that deification prevails among "a people who are inclined to submission and among whom accordingly great social distinctions arise." This is not the case; divine kingship can and does exist where social distinctions are far less marked than in Europe or America. Deification is consistent with a spirit of sturdy independence, for although representing the god the king may be treated with scant respect combined with much etiquette. Classical scholars have evidently formed their opinion from late Near Eastern monarchies which are debased and not typical examples. They have been loath to believe that the free Greeks ever maintained an institution so servile in appearance.

Among deified men are priests as well as kings, but the two classes are clearly to be distinguished only in the later stages of development. In the earliest stages it is so obviously impossible to differentiate them that the term priest-king has been coined to designate the type. It is, however, necessary here to draw the line at kings in order not to range over such personages as chieftains, magicians, rain makers and the like.

Deification is an essential constituent of the earliest recorded religions. At the present day it is so widely distributed that its extreme antiquity cannot be doubted. It is only in comparatively recent times and among a minority of the peoples of the earth that religion has become entirely divorced from the idea of a god present in a man. Unfortunately, the democratic tendencies of the nineteenth century have blinded historians to the importance of divine kingship in history, so that neither its distribution nor its contents are as well known as they might be.

The land of origin of the belief in divine

kingship is not known, but it lay most probably in the Near East. In Egypt the belief was already in existence when our earliest records begin. In Sumer the earliest kings are said not to have been deified yet to have been divinely sent redeemers and vicars of the gods. Later they were actually worshiped. It has been denied that kings were divine in ancient India, but that is flying in the face of the most explicit statements by Manu and the theory of the coronation ceremony as given in the ritual books. The divinity of kings is so rooted in the Indian world that it has often been transferred even to European officials. Divine kings are also to be found in Indo-China, Japan and throughout Polynesia. The so-called culture heroes of Melanesia turn out on examination to be merely immigrant divine chiefs, the ancestors of the present or of an extinct dynasty. In Peru and parts of North America the presence of the custom is unmistakable. It occurs in Africa, as is only to be expected since Egyptian influence is known to have spread up the Nile. Here divine kings shade off into rain makers, witch doctors and the like. Homer regarded his kings as divine. In royal Rome the evidence is more meager and we are reduced to inference, but Frazer has established the inference on a firm basis (see *The Magical Origin of Kings*, London 1920, p. 197-200, 249-50). Deification was revived in imperial Rome under oriental influence. The movement was a popular one, for the people, not satisfied with abstract gods, required a present one, and as the emperor had superseded the local kings he succeeded to their divinity. The Roman aristocracy may have complied with this either from fear or from flattery, but with the masses it was rather the continuation of a long and congenial habit which persisted even under the rule of the Christian emperors.

Mediaeval kingship has a twofold root: the Roman imperial dignity and the Germanic kings, who traced their lineage back to individual gods and were, in some cases at least, termed demigods. Monotheism, but still more the ambition of the popes, prevented the kings from being recognized as gods; but the spirit of God is present with them and the line that divides them from divine kings is very thin. It became thinner with the progress toward absolutism, until in the seventeenth century the high point of monarchical claims was reached when a bishop of Chartres could maintain that kings are not only ordained by God but are

themselves gods. In western Europe the divine character of kings dwindled into little more than a formula. It survived in eastern Europe, and in Russia it was still very strong in the nineteenth century. The Great War has everywhere dealt it a fatal blow.

The king is frequently not one but many gods; according to Manu he partakes of the elements of eight guardians of the world (see *Law Treatise*, bk. v, verse 96). As far back as we can trace this institution he is more specially related to the sun god. It is not clear whether this solar character is original or whether the diffusion of sun worship cults transformed an institution which originally had nothing to do with the sun. At any rate, the sun dominates divine kingship among the more advanced peoples, and where this domination is absent survivals sometimes indicate that it once existed but has disappeared.

From earliest times the principle of heredity plays some part in so far as kingship is usually limited to a certain family or caste; but the rigid modern rule of succession is a later development which many peoples of the earth never reached. In the earlier forms a man may be qualified by descent for kingship, but he does not automatically become a god on the demise of his predecessor. He has to go through a consecration which makes him into a god and as long as he has not undergone the coronation rites he is not a king, although he may be de facto ruler. Any other man who secures the royal consecration will become king. In pre-historic times the succession seems to have been decided by ritual combat or tests, for survivals of such a method occur in most coronation ceremonies, although they may be mere forms such as the challenge at the English coronation. The idea seems to have been that the god gave success to the man whom he favored as his representative or else that the man who possessed the most vigor was the best qualified to represent the god.

The theory that the king is reborn as a god in the coronation ceremonies is explicitly stated in Egypt and India and by mediaeval theorists. It has left traces elsewhere. In the more primitive ceremonies the rebirth is carried out with great literalness. Thus in India the king's three robes are identified with the three membranes of the womb. Many constituent elements of the coronation are remarkably constant throughout the world, e.g. the oath, communion, robing, lustration, unction, investiture, enthronization,

final feast and procession. Some have a solar significance, e.g. the crown. With automatic succession to kingship coronation ceremonies cease to have any point and they become mere pageantry or drop out altogether.

The union of the king with the sky or sun is no mere play of fancy. It gives the king control over the weather and the universe generally, and through him a good food supply can be insured with consequent prosperity. This, and not ruling, is the essential function of primitive kings. If prosperity fails the people blame the king and in many cases depose or slay him. In rarer cases the king is put to death if his health fails, for his weakness is held to react upon the course of nature. Orientals still look to European officials for good weather. Belief in this power of the king survived in England in the nineteenth century.

The king's life giving powers extend to healing. This gift became extinct in England only with the Stuarts, in France not until the nineteenth century. His supernatural power depends in general on his respecting and enforcing custom, law and order. If he does not do this the gods leave him. Hence he is commonly a judge and thus also arise judicial and legislative powers which survive his divinity. Further as vice god the king receives offerings which in course of time become tribute. The religious offerings develop into a royal revenue. The invention of currency makes the assessment more precise. As this revenue becomes increasingly devoted to works of public utility it shades into taxation in the modern sense.

DEISM is the name commonly applied to a critical movement within the Christian tradition which arose in the early seventeenth century and lasted into the nineteenth, until religious life was transformed by romantic thought and feeling. Strictly speaking, deism is the position that natural theology and rational morality, as understood in the age of reason, are a sufficient content of religion. It is thus to be distinguished both from more conservative reinterpretations of tradition and from more radical skepticism and atheism. But deism is also widely used to signify all manifestations of the enlightenment spirit in religion from the reputed orthodoxy of Samuel Clarke to the anti-Christian zeal of Voltaire. Although technically inaccurate this usage shows deism to be one particular compromise expression of rationalistic, humanistic and secular tendencies permeating eighteenth century religion.

The deist movement was the spread of a certain attitude, not an organized sect. It was an affair of the intellectual classes and scarcely affected the masses, in whom the same tendencies appeared as religious indifference or formalism. It was not so much a religious movement as a philosophical and ethical criticism of the Christian tradition in the light of the growing secular spirit of the day. It expressed the increasing confidence in the intellectual power of human reason and the moral power of human nature which has since entered so deeply into the modern spirit. It was thus the first serious attempt to adapt the religious tradition to the forces and the attitudes of the modern world.

Although foreshadowed in the work of the sixteenth century humanists, the Socinians and the Dutch Calvinists of the seventeenth century the notion of a strictly rational religion, based upon the certain deliverances of the light of nature, was primarily a product of the theological disputes and religious wars of the Puritan era. Disgust with such quarrels and the desire to turn to commercial expansion hastened the general secularization of life implicit in Protestantism, especially in Holland and England. In 1624 Lord Herbert of Cherbury and in 1627 Grotius offered a common set of religious tenets on which all rational men might agree to live in peace. Thereafter there arose in England a long line of religious rationalists culminating in Locke, men far more concerned with ending religious controversy than with promoting the religious life, increasingly secular in their interests and ethical in their religious emphasis. They sought in the tradition an irreducible

minimum that could cause no social disturbance and proposed to tolerate difference of opinion on non-essentials. Their attitude triumphed in the English Toleration Act of 1689.

Thus the "religion of reason" had formulated its tenets and won wide acceptance before it was reenforced by the scientific rationalism of the Newtonian age. The new mechanical science brought strong intellectual support to a rational religion already worked out in the interest of social harmony. Newton's *Principia* in 1687 loosed a flood of books stripping the religious tradition of all that could not pass the twin tests of scientific rationality and social utility. The aim of religion, from their secular point of view, was simple: to make good citizens; the means, a brief set of rational propositions offering an incentive to the virtues of an individualistic and commercially minded society. The universal reason of man revealed the existence of God, the presence of a natural moral law and the certainty of future rewards and punishments based on its observance. This was "natural religion"; everything else in Christianity was revelation.

Men differed not as to the fundamental importance of this natural religion but only as to whether revelation was also necessary. Orthodox rationalists insisted on both elements of tradition; the radicals, who assumed the name of deists, rejected revelation and reduced religion to these three tenets. The deists found themselves involved in two successive debates. They had first to maintain against rational supernaturalists like Tillotson, Samuel Clarke and Locke that God had added no further revelation to what Arthur Bury in 1690 called *The Naked Gospel*. Natural religion had always been perfectly complete. The God who created the Newtonian order of nature would not ask of men more than universal benevolence; above all, He would not impose the welter of superstitious religious rites and doctrines. The deists went on to attack vigorously all that distinguished Christianity from natural religion and especially to assail the two supports of revelation, prophecies and miracles. Tindal and Morgan pointed to the irrationalities and inhumanities of historic Christianity; Chubb declared that Jesus Himself had been a pure deist. Anthony Collins undermined the argument from the fulfilment of prophesy, while Woolston and later Hume marshaled the Newtonian world order against the credibility of miracles. Before this first debate had been won, however, the deists found themselves attacked from another quarter by men

who criticized the tenets of natural religion as having no firmer logical basis than those of revelation and concluded with Hume that "our most holy religion is founded not on reason but on faith." In England the attack on natural religion itself was made, by men like William Law, Joseph Butler, Henry Dodwell and Hume, in the interests of faith. The English deists were unable to stand up against the combined onslaughts of orthodoxy and fideism, and as a serious movement deism disappeared by 1750 before the rising tide of evangelicalism.

In France, however, these deistic ideas were transformed into the weapons of a bitter anticlerical attack on the Catholic church. Secularism and rationalism had already found expression in the seventeenth century alliance between the Cartesian scientific philosophy and the Gallican church; and Malebranche, Bossuet and Fénelon had worked out a rational supernaturalism comparable in motive and spirit to that of Tillotson and Clarke. But the next century saw an unparalleled onslaught upon the traditional political and economic system, upon the power of the church as its chief bulwark and upon Christianity as the foundation of clericalism. It was Voltaire who brought deism to France and opposed rational religion (*théisme*) not only to Catholicism but to all forms of Christianity, however purified. As the source of his effective satire and as the weapon of Diderot and the *encyclopédistes* French deism, although similar in content to English deism, shows a much more critical and biting spirit. The French used deism to attack a corrupt and entrenched clerical system, but the English in opposing sectarian fanaticism and doctrinal disputes found no real enemy in the easy going and subservient Establishment. Even when French deists had a serious positive interest in the religion of reason it was still as a political instrument; Voltaire, who never followed the later fashion into atheism and materialism, felt it a necessary club to enforce the social virtues on the masses. Rousseau alone seems really to have felt the natural religion in which his Savoyard vicar, in the *Émile*, confesses his faith. Rousseau's deism offers no new doctrines; it no longer is a keen weapon against Christianity and its inner, emotional mystical quality foreshadows the religious feeling of the romanticists.

Entering Germany also about 1750 deism found congenial soil in the reigning Wolffian philosophy, a combination of Protestant scholasticism and Leibnitz' scientific rationalism. But

far from being a revolutionary weapon German rational religion enjoyed the patronage of the courts, the upper class and the university circles. Not only supernatural rationalism of the Tillotson type but also much more radical forms of deistic thought were strong in the pulpits and theological faculties well into the nineteenth century and greatly affected all subsequent German theology. The most outspoken German deist was Reimarus; Lessing edited his posthumous attack on all Christian revelation in 1774 as *Wolfenbüttel Fragments*. Lessing himself, the greatest literary exponent of deism and religious toleration, foreshadowed like Rousseau the turning toward romanticism, especially in his notion of progressive religious development. The classic German expression, however, was Kant's *Die Religion innerhalb der Grenzen der blossen Vernunft*, in 1793. Kant remained a faithful adherent of the deistic tenets of God, freedom and immortality, although in founding them on the needs of human nature rather than on a rationalistic metaphysic he paved the way for the great romantic philosophies of religion.

Although deism disappeared even in Germany by the opening of the nineteenth century it left a permanent deposit. Its ideal of religious toleration in the interests of secular social peace has never been seriously assailed outside Catholic lands. The critical study of the Scriptures and of church history which it initiated, as well as its interest in comparative religion, bore fruit in the work of the Tübingen school and their many successors in religious scholarship. The failure of its natural theology drove theologians to another form of religious apologetic; but the secular tendency it represented, its strong emphasis on the ethical and social content of religion, its identification of religion with a form of rational belief which must be harmonized with science, above all, its criticism of the religious tradition in the interests of present intellectual and moral needs, have played an increasing part in subsequent religious reconstruction. Its very failure served but to provoke a renewed attempt to bring religion into line with the forces of the modern world, and in that attempt much that the deists expressed in the form of eighteenth century rationalism and humanitarianism was reworked into newer, nineteenth century molds. The critical movement in religion today is as much the heir of deism as of the romantic reaction against its collapse.

DELANE, JOHN THADEUS (1817-79), English journalist. After studying at Magdalen Hall, Oxford, Delane followed his father's example by joining the staff of the *London Times*. In 1841 on the death of Thomas Barnes he was appointed to the editorship. Already the chief newspaper in England, the *Times* soon obtained a position of unexampled political influence. Under Delane it was on the whole politically independent, devoted to the interests and views of the expanding industrial and commercial classes, well informed for its day and dignified in tone, although not above occasional vicious attacks on enemies. By 1855 it is said to have had a circulation of 40,000, a very large one for a time when newspapers were heavily taxed. Delane's influence was due not to his own writing but largely to his skill in obtaining early and accurate information, partly through personal intimacy with leading politicians, partly as a result of technical improvements in methods of news gathering. In 1845 at the height of the railway mania he exposed "the knaves and warned the dupes" and soon after startled the world by announcing the imminent repeal of the corn laws. Under Delane the *Times* supported the political enfranchisement of the Jews; but it was not always tolerant, for it fanned the flame of the No Popery agitation of 1850. In the Crimean War

the revelations of the *Times* correspondent forced military reforms on the government. Delane was often reproached for subservience to Palmerston by Bright, Cobden and others; but his influence helped to prevent Palmerston from offering armed assistance to Denmark and exposed his relations with Neapolitan revolutionaries. Delane had the gift of attracting first class men to the *Times* staff. Among those who wrote regularly for the paper were Sir William H. Russell, Charles Greville, A. W. Kinglake, Roundell Palmer, Robert Lowe, Abraham Hayward, Henry Reeve, G. S. Venables, the Reverend T. Mozley, H. S. O. de Blowitz and Leonard (afterwards Lord) Courtney. Delane resigned his post in 1877.

DELANY, MARTIN ROBINSON (1812-85), American Negro journalist and agitator. Delany was originally trained in medicine, but in 1843 he began in Pittsburgh the publication of a newspaper, the *Mystery*, one of the earliest periodicals for Negroes in the United States. Later he was associated with Frederick Douglass in the publication of the *North Star* and in 1848 was mobbed in northern Ohio. He was an organizer of some of the earliest Negro associations devoted to the uplift of the race and was the author of a small book, *The Condition, Elevation, Emigration, and Destiny of the Colored People of the United States, Politically Considered* (Philadelphia 1852), which was remarkable in that it laid down so early the idea of adjusting the Negro to a free life by means of industrial education. In this work he attacked the activities of the American Colonization Society, which he viewed as a conspiracy to deport all free and able Negroes to Africa lest they aid in opening the eyes of the American slave. He affirmed the Negro's right to call himself an American. On his call a National Emigration Convention met in 1854 in Cleveland and discussed plans for resettling ex-slaves in Africa. In 1859 he made a trip to Africa as head of the Niger valley exploring party to investigate prospects for emigrants. After serving as a surgeon in the Civil War (he was the first Negro major in the United States Army) and in several government posts he ran for the lieutenant governorship of South Carolina in 1874 but was defeated. He was also the author of *Principia of Ethnology* (Philadel-

phia 1879), a book which reflected the growth of a new feeling of Negro race pride. Delany was restless and of provocative temper and his schemes bore little immediate fruit. His work as a publicist, however, contributed to the progress of the Negro in the United States and his educational theory bore fruit in the later work of Booker T. Washington.

BENJAMIN BRAWLEY

DELBRÜCK, HANS (1848-1929), German historian and political thinker. Delbrück came of a family of influential Prussian government officials. He served as an officer in the Franco-Prussian War and was tutor to Prince Waldemar of Prussia from 1874 to 1879. He was professor of history at the University of Berlin from 1885 to 1921 and editor of the *Preussische Jahrbücher* from 1883 to 1923.

Like the great German historians of the nineteenth century Delbrück combined history and politics and was always striving to make the knowledge of the past useful for the present. Although he was for a time a member of the Reichstag and of the Prussian Diet as a representative of the Free Conservative party, his political influence came from the intellectual force of his personality, from his intimate association with leading statesmen and through his writings rather than from his work as a practical politician. As editor of the *Preussische Jahrbücher* and through his famous *Mittwochabend* club, organized in 1914 to discuss political problems arising out of the war and attracting many of the leading German intellectual and political figures, he was able to exercise great political influence. He invariably combated courageously and independently whatever seemed to him politically false or pernicious. During the war he vehemently opposed submarine warfare, Tirpitz and the Ludendorff circle. After the war, although he had been most intimately associated with the monarchy, he ranged himself on the side of the new democratic republic. He also carried on an indefatigable struggle to establish scientific proof against the charge of Germany's war guilt.

Delbrück's work as a historian is peculiarly comprehensive for an age characterized by specialization. His most important contributions were in the field of military history, which he covered from antiquity to the time of Napoleon. Like Ranke he also attempted to write a world history, in which he aimed to draw a picture of

historical development in clear straight lines which keep the purely political and military events well in the foreground. His work always exhibited a tendency toward sharp and occasionally too simplified theses, which were, however, challenging and provocative of further investigation.

DELCASSÉ, THÉOPHILE (1852-1923), French statesman. After contributing to Gambetta's newspaper, serving in the Chamber of Deputies and acting as undersecretary, then as minister, for the colonies from 1893 to 1895, Delcassé became minister for foreign affairs in June, 1898, retaining this post under successive governments until June, 1905. Although he was regarded as a member of the Left, Delcassé showed no real interest in social problems. He disapproved of the reduction of military expenditure and throughout his life displayed a thoroughgoing nationalist attitude. His interest centered almost exclusively upon colonial and foreign affairs and he appears from the beginning to have set himself the goal of eliminating the friction between England and France and bringing about an Anglo-French-Russian understanding. In the acute crisis resulting from the Marchand mission to Fashoda Delcassé had the courage to yield to England, thus taking a first step toward an entente. In 1900 and 1902 he concluded agreements with Italy which gave France a free hand in Morocco in return for a free hand for Italy in Tripoli besides assurances against Italian participation in any aggressive policy against France. Delcassé's tentative advances to Germany in the years 1898-1901 were probably meant as a means of bringing pressure upon England. Negotiations with the latter power began in 1902 and led to the famous agreement of April 8, 1904, which established the *entente cordiale*. The agreement gave England a free hand in Egypt in return for a free hand for France in Morocco. Secret clauses en-

visaged the eventual partition of Morocco, and an agreement later in the year associated Spain. Delcassé intended to exclude Germany from a share of the spoils, and his failure to notify her officially of what had been decided resulted in the first Moroccan crisis of 1905 and conflict with his colleagues, in consequence of which he resigned. Delcassé resumed political activity in 1909. From 1911 until 1913 he was minister of marine and for nine months ambassador to Russia, devoting himself to the strengthening of the Franco-Russian Alliance. In August, 1914, he again became minister for foreign affairs. He was instrumental in bringing Italy into the war on the side of the Allies and signed the convention which allotted Constantinople to the Russians. Delcassé miscalculated entirely the Bulgarian attitude and finally resigned and went into retirement October, 1915, because of disapproval of the Salonika expedition. Despite several serious errors he ranks as one of the most significant of French foreign ministers. He founded the entente, reestablished the position of France in international affairs and played an important role in the developments which led directly to the war of 1914.

Delcassé* (Paris 1915).

DELEGATION OF POWERS. Political science has long been concerned with the problem of the proper limits of delegation of powers by governmental agencies. The question has been raised with regard to the right of judges to delegate their powers to commissioners; of executive officers to act through subordinates; of legislatures to grant their legislative powers to administrative officials, to local government units, or to resort to the referendum. Today it has assumed new importance as legislatures are making increasing use of extralegislative agencies to aid them in the exercise of their traditional powers.

A new era of activity and invention for the age old practise of legislative delegation may be said to have begun in England with the establishment of the General Board of Health

in 1848 (11 & 12 Vict. c. 63) and in the United States with the Interstate Commerce Commission in 1887 (24 Stat. c. 104, sect. 11, p. 383). In both countries delegations have been made to administrative rather than judicial bodies, and in the United States the use of special regulating commissions outside the regular departmental organizations has resulted in a striking increase of administrative agencies.

The result is that today administrative regulations and decisions are often more important in daily life than are the terms of the statute book. In the United States alone railroad and tariff rates are fixed, quarantines established, warehouses and grain exchanges regulated, air commerce and radio directed, professional standards established, fair trade practises determined, public resources conserved and countless other activities controlled by extralegislative agencies.

Administrative agencies exercise these powers by making rules and regulations of general application or by following a quasi-judicial procedure in which they render decisions in particular cases. The power of the administrative branch of the government is thus increased apparently at the expense both of legislature and of judiciary. The inevitable cry of "bureaucracy" has further confused the issue.

In England, where the separation of powers has no legal status and Parliament is supreme, effective opposition to delegating statutes is limited to political channels, and there is a growing practise of granting powers in terms so vague that court review under the doctrine of *ultra vires* becomes impossible. The continental theory of the independent ordinance power of executive officers has supported the practise of "skeleton legislation," whereby the legislature may broadly state policies and objectives, leaving all details to the appropriate executive agency. In the United States it is more usual to legislate in detail and to define clearly the limits of delegated power.

Delegation is often a device to make possible the adaptation of rules to varying local needs. It is also resorted to in times of national emergency to bring about necessary concentration of power. During the war of 1914-18 it attained spectacular proportions. It is often regarded as a war phenomenon, but it is perhaps more accurate to say that its normal course was altered by the war and that it was checked at points by the post-war reaction against all forms of governmental control. Probably increased legis-

lative delegation should be considered a phenomenon of the modern positive state. Changing concepts of the function of government in our complex economic world have placed an ever increasing burden upon modern legislatures. The mere volume of business makes delegation necessary. The spread of democracy, which has done away with a ruling class, increased the size of legislative bodies and altered the role of individual members, has made it more difficult for legislatures to deal effectively with their business. The importance of technology in the modern world renders mere intelligence inadequate in solving governmental problems. A rapidly changing economic and social order demands that any scheme of governmental control and regulation be flexible. Administrative agencies offer the services of the expert and are better equipped for experimentation than legislatures.

Discussion of the underlying legal and political issues has been hampered in England and America by the confusion of the problem with the maxim *delegatus non potest delegare*. This maxim, which originated with the glossators, was introduced into English law through a misreading of Bracton, developed there as a doctrine of agency, was established by Coke in English public law in decisions forbidding the delegation of judicial power and found its way into the writings of English and American publicists in the guise of a fundamental principle of free government. In the United States, partly because of the doctrine that all governmental powers are delegated by the sovereign people, partly because of its logical affiliation with the dogma of the separation of powers, the maxim became identified with the problem of delegation by governmental bodies. Appearing as a corollary of this fundamental dogma it received the sanction of constitutional law, and the problem of delegation was obscured by the foggy concepts that accompany the doctrine of the trinity of governmental powers.

Because of this confusion the legal and constitutional aspects of the problem remain veiled in uncertainty. By arbitrarily defining the word legislative the United States Supreme Court has usually paid lip service to the supposed constitutional doctrine but has in fact sustained each new delegation of powers by Congress. In the state courts a fundamentalist attitude toward the constitutional dogma has at times blocked legislative experimentation in delegation. It has become settled law in the United

States, however, that an administrative officer can make regulations only by virtue of his statutory authority, and in both state and federal courts particular regulations by an administrative agency have been declared "legislative" and therefore *ultra vires*. By reading into all delegations the requirement that regulations be "reasonable" and by invoking the doctrines of due process and *ultra vires* courts have established a far reaching right to review administrative rule making and to control the exercise of delegated powers.

Perhaps because of opposition to a practise the acceptance of which involves substantial modification of traditional modes of English and American constitutional thought proponents of legislative delegation have discussed the problem chiefly in terms of possible safeguards. The usual proposals have been adequate provision for publication; precision in the terms of delegating statutes for the guidance of courts and administrative bodies; consultation of interested parties; legislative control either by providing opportunity for legislative rejection or approval of regulations or by a system of continuous supervision by legislative committees; far reaching provisions for court review under *ultra vires* proceedings; extension and improvement of civil service standards. The desirability of extension of state liability for torts has also been considered in this connection.

There has been little effort to do more than enunciate these proposals. Few would question that regulations should be as accessible to the citizen who must observe them as are the statutes. That statutes should be clear is a first principle of legislative drafting. How detailed they should be is difficult to determine. Consultation of interested parties may become consultation of powerful organizations. The complex problems of the proper relations between legislative and administrative groups and of the desirable limits of court review of administrative action can never be solved by a formula. There are dangers in judicial review as well as advantages. Submission of regulations to the legislative body has proved inadequate in England and futile when provided for in the United States. No satisfactory machinery for committee supervision has yet been devised. The potentialities of legislative control through the mastery of the purse strings have perhaps not been fully understood.

Definition of the respective roles of legis-

lators and administrators in their joint undertakings, formulation of criteria for deciding when delegation is desirable, determination of the factors to be considered by legislators in preparing delegating statutes—these are major problems to which less attention has been given. For their solution one must undertake such tasks as a comparison of the administrative and legislative processes and of the quality and experience of the personnel of the two groups. The subject matter of legislation, the objectives sought and the groups affected by it must be taken into account. Like most of the problems of political science these matters cannot be considered satisfactorily apart from a particular political system.

DE LEON, DANIEL (1852-1914), American socialist theorist and labor leader. De Leon was born in Curaçao, Dutch West Indies, and came to the United States in his early twenties. He studied in Holland, Germany and at the Columbia University Law School and later lectured on international law and diplomacy at Columbia. In 1886 he supported Henry George's single tax campaign for the mayoralty of New York, in 1888 he joined the Knights of Labor and in 1890 the Socialist Labor party. In 1891 he became editor of the party's paper, the *People*, first a weekly and later a daily, and was the party's guiding mind until his death. In 1895 he launched the Socialist Trade and Labor Alli-

ance, an organization of trade unions and political groupings of a socialist orientation. In 1905 he took part in the launching of the Industrial Workers of the World (I.W.W.). He advocated the overthrow of the capitalist state and the establishment of a socialist society organized around industrial units of workers. De Leon's theory of the industrial state was accepted by Lenin as a picture of the ultimate form of government in communist Russia. De Leon emphasized the economic essence of political government and the futility of political reform but believed in political action as a means of socialist propaganda and was himself many times the candidate of his party for political office. His *Two Pages from Roman History* (New York 1903) is an extraordinarily clear and penetrating analysis of the nature of labor leadership under American conditions. Trade unions in his view could not materially improve working conditions, and he regarded the American Federation of Labor, which combated socialist influence, as a servant of capitalism. De Leon was the theorist and outstanding practitioner of dual unionism; from him the later radical wings of socialism and of communism in the United States took their cues. He favored a strongly centralized and militant labor movement, launched bitter attacks on all non-political unionists and caused frequent expulsions of nonconformists from his own party. His pamphlets are valuable for the study of the uncompromising Marxian attitude toward American politics and economics. De Leon made available translations into English of works by Engels, Marx, Lassalle, Kautsky, Bebel and E. Sue.

DELFICO, MELCHIORRE (1744-1835), Italian publicist. Delfico was educated at Naples and came early under the influence of the en-

lightenment and spirit of reform which pervaded that city during the latter half of the eighteenth century. As a statesman occupying high office in the Parthenopean Republic of 1799 and participating in the Bonapartist Kingdom of Naples he strove diligently to introduce political and social reform; the return of the Bourbons in 1815 was the negative response to his hopes and efforts. As a writer he has been called by Gentile the "most faithful Italian representative of eighteenth century French spirit." Borrowing sensationalistic psychology from Condillac and his successors Delfico applied it to ethics (*Indizi di morale*, Naples 1775) and to social philosophy and pedagogy (Reale Accademia della Scienze, Naples, *Atti*, vol. i, 1819, p. 343-445). Indifferent to the implicit self-contradiction he followed the publication of *Memorie storiche della repubblica di San Marino* (Milan 1804; 4th ed., 3 vols., Naples 1865) with *Pensieri sull'istoria e sull'incertezza ed inutilità della medesima* (Forlì 1808; 3rd ed. Naples 1814). Primarily this work was a reflection of the antihistorical bias prevalent among the thinkers of the Enlightenment, who, intent on present reform and future perfectibility, regarded history as not only a useless labor but an emporium of bad examples. But the *Pensieri* also evinced a lively sense of the necessity of critical rigor in historiography and insisted upon the primary significance of spiritual and intellectual development. A combination of these tendencies appears in Delfico's erudite but hardly candid arguments that historians, particularly historians of Rome, had exalted the most uncouth barbarism into moral excellence.

In his *Ricerche sul vero carattere della giurisprudenza romana e de suoi cultori* (Naples 1791; 3rd ed. 1815) Delfico had previously attempted to expose the customary misinterpretation of Roman law, which far from being the consummate expression of justice was to his mind characterized by uncertainty and arbitrariness. Against the jurists wedded to the forensic tradition and the upholders of aristocratic privilege Delfico demanded that Roman as well as all the other antiquated types of law used in Naples should be abolished and replaced by a unified code consistent with the principle of human perfectibility. Delfico's *Opere complete* (4 vols., Teramo 1901-05) include writings defending free trade, the removal of feudal privileges in agrarian administration and industrial liberalism. The best known of his economic works, *Memoria sulla libertà del commercio* (c.

1797), was included in the Custodi collection (parte moderna, vol. xxxix).

DELINQUENCY. *See* CRIME; JUVENILE DELINQUENCY.

DELISLE, LÉOPOLD VICTOR (1826-1910), French historian and bibliographer. Delisle was born in Normandy and studied under Guérard at the École des Chartes. From 1874 to 1905 he was director of the Bibliothèque Nationale and it was largely through his efforts that the organization and cataloguing of the enormous collections contained in the library were begun. In his only general work, *Études sur la condition de la classe agricole et l'état de l'agriculture en Normandie au moyen âge* (Évreux 1851), Delisle assembled a considerable mass of exact facts regarding the material conditions of the exploitation and cultivation of the landed estates during the Middle Ages. In his "Mémoire sur les opérations financières des templiers" (in Académie des Inscriptions et Belles-Lettres, *Mémoires*, vol. xxxiii, 1889, pt. ii) he showed the leading part played by the orders of the Templars as depository banks in the financial organization of the Middle Ages. Delisle's reputation, however, rests not on his general historical works, which were very few, but rather on his work in opening new lines in palaeography and diplomatic. He published a multitude of memoirs and volumes dealing with the history and criticism of manuscripts of the Middle Ages; and his publications of numerous texts of the utmost importance, preceded in many instances by very comprehensive introductions, afford material for the study of not only the social but also the administrative and intellectual history of mediaeval France.

DELITZSCH, FRIEDRICH (1850-1922), German orientalist. He was the son of Franz Delitzsch, one of the most eminent Biblical

scholars of the nineteenth century, and was early attracted to Semitic studies, taking his doctorate at Leipsic in 1873. The same year he became a student of Schrader, who had published the first German treatise on Assyriology in 1872. At that time cuneiform studies were pursued only in England and France, mainly by brilliant dilettantes, so that the scientific character of the decipherment was doubted by many scholars in related fields. Delitzsch proceeded to study Assyrian grammar and lexicography according to the most approved methods of modern philology, and with the aid of his teacher Schrader and a group of gifted pupils was able before 1890 to establish the correctness of the decipherment beyond doubt. This work he supplemented by his *Assyrisches Handwörterbuch* (Leipsic 1896), which has remained the standard Assyrian dictionary up to the present, and by his epoch making *Assyrische Grammatik* (with English translation, Berlin 1889; 2nd ed. 1906). He crowned the decipherment of Sumerian by his *Grundzüge der sumerischen Grammatik* (Leipsic 1914) and *Sumerisches Glossar* (Leipsic 1914). Delitzsch also published a great many inscriptions, historical, religious, social and economic, and his interest in the reconstruction of the social and economic life of ancient Babylonia may be gauged by his remarkable little book *Handel und Wandel in Altbabylonien* (Stuttgart 1910). He was one of the founders of the Deutsche Orient-Gesellschaft, the foremost German society for the promotion of archaeological research in the Near East, and he did probably more than any other German scholar to interest the public in ancient oriental archaeology. He was a great teacher and attracted students from all over the world to his seminary in the University of Berlin. Virtually all American Assyriologists have been his pupils or his pupils' pupils. He is now recognized by all Semitic scholars as the greatest Assyriologist since the first decipherment of the Assyrian inscriptions in 1846.

DEMAND.

THEORY. Demand is one of the most elementary concepts in economics and one of the most seriously ambiguous even today. Properly understood it includes the entire complex of condi-

tions, except price, which determines the amount of a commodity salable in a given market at any named price. Demand is indicated by, and is elliptically used to mean, a schedule or curve showing the amount salable at each price along a scale covering the range of probable variation in price. The schedule or curve states in quantitative form, if drawn to a scale of known magnitudes, the hypothetical law of demand: "if any specified price, then the indicated quantity would be sold."

Confusion with reference to demand arises mainly from two sources. In the first place, popular thought and usage do not distinguish between demand as the actual quantity of a commodity bought, which "under given conditions" depends on the price, and the "given conditions" which determine how much the market will take at any named price. Thus in general usage demand is, as J. S. Mill remarked, both the effect and the cause of price. In scientific usage the term is now defined in the latter sense only. Thus a change in demand occurs only when there is a change in sales without a change in price or not explicable by a price change alone. When the reference is to actual quantity bought as a result of a certain price the term to be used is sales or consumption, but this distinction in terminology is not always carefully observed.

The second source of confusion is the apparent symmetry between the concepts of demand and of supply in popular usage as opposed to the asymmetry involved in the strict scientific terminology. In popular as well as scientific usage supply refers definitely and unambiguously to a quantity or rate of flow of a commodity. In a market where already existing goods are to be exchanged without any reference to conditions of production supply conditions in the sense of "reservation prices" merely reflect the demand of the initial owners and are properly a part of the total demand, as Wicksteed, Davenport and others have emphasized. And in the more usual economic problem, where conditions of production are brought into relations with conditions of consumption, supply again refers to the actual amount or rate of production, a quantity or stream of commodity. What corresponds to demand, as defined above, on the supply side of the equation is not the quantity or rate of flow designated by supply but the supply schedule or curve reflecting the conditions of production.

The development of usage and of clarity as to the law of demand from the eighteenth century on has proceeded along two lines. It involved

problems in psychology and philosophy, relating to the basis in human nature of the fact that other things being equal higher prices are accompanied by decreased consumption. It was connected also with the extension to economic theory of the quantitative logic of causality in the form of function and variable, previously worked out in mathematical mechanics and applied in the natural sciences at large. In view of the background of economics in utilitarian moral philosophy the psychological theorizing first took the form of a law that utility, understood as a pleasure, decreases with increasing consumption. But this view was quickly seen to be both vulnerable to criticism and unessential. Demand is a phenomenon of motivation; but the economist dealing with demand is not called upon to choose any particular theory of the ultimate nature of motives, because demand involves motivation merely in the aspect of comparison of the intensity of motives. The demand for one commodity cannot be considered alone; it is a question of the extent to which consumers will choose to spend a limited income in one way rather than in other possible ways. This view is in accord with scientific logic, involving the interaction of many variables. It considers income and consumption in the light of a continuous flow of purchasing power and eliminates the typical illustrations of diminishing utility, such as the eating of successive apples, applying to a single unit of time.

A satisfactory discussion of the demand for a given commodity in a given market must recognize several major factors: first, the psychology of consumers—their relative estimation of different commodities and services, and the ways in which these estimates vary with variations in the quantities; second, the purchasing power, or realistically the money incomes of consumers, including the way in which income is distributed among individuals and classes belonging to the market; third, the prices at which competing or substitute goods are available; and fourth, the prices of complementary goods. For completeness it is well to name explicitly a fifth factor regarding the relations of substitution and complementarity between the given good and other goods; this is a separate variable, liable to change independently of the prices of the goods themselves. Prices for substitute and complementary goods stand in an opposite relation to demand; higher prices for the former increase the demand or move the schedule upward, higher prices for the latter lower it and vice versa. It is important to note that there may be relations of both kinds

at the same time between the same two goods. This fact is especially important because it is typical for the productive services, the various kinds of labor and property uses; these are generally necessary to each other's effective use, yet they are in competition for employment, and this relation sets the problem of distribution theory. Under conditions of complementarity or "joint demand" the relative desirability of the individual commodities is determined by their relative power to increase the usefulness of the combination; the principle employed in this process has been called by Marshall the "principle of substitution" or of "variation in proportions." Consumers value commodities just as producers value labor and other productive services, as increments not merely to a stock of the same kind but to a combination of several kinds used together.

In spite of the fact that the demand for any commodity is essentially a function involving many variables the quantity demanded is commonly much more dependent at any given time on the price of that commodity than upon any other single cause. It is of vital interest to know as much as possible about this relation, and obviously such knowledge would be the first step to a more inclusive understanding. For the guidance of such study it is necessary to describe a demand curve or the relation pictured by it between quantity and price, in terms as simple and general as possible. Long before statistical study was even proposed it was recognized that the crucial property of the demand is the relation between the amounts of change in the two variables. Various writers, among them Malthus and J. S. Mill, had noticed that commodities differ widely in the amount of change in quantity purchased which is associated with a given change in price. With some commodities, generally luxuries, a small decline in price will bring about a large change in consumption, while with others, generally necessities, the opposite holds true. Cournot gave a precise mathematical form to this principle; Alfred Marshall gave it the name "elasticity of demand," and it is through him that economists have become familiar with it. The name is not a good one; "responsiveness of consumption" would be much better.

To measure and compare the elasticities of demand for two or more commodities it is necessary first to express variations in price and quantity in units independent of the accidental commodity and price measures, and second to have a zero point or norm from which to measure up-

Demand

ward and downward and contrast high and low elasticities. The first of these needs is met by stating variations in fractions or ratios and the second by taking "unit elasticity" as the standard. It is readily shown mathematically that the following equations hold good, either of which may be taken as defining the elasticity of demand:

$$(1) e = \frac{dq}{q} \div \frac{dp}{p} = \frac{dq}{dp} \cdot \frac{p}{q}; (2) p^e q = c, \text{ where}$$

q represents quantity, p price, e the elasticity of demand and c a constant. It is evident that if e equals unity or in general is constant, then the second equation directly states that price times quantity is unvarying for all changes in price or quantity. These equations are valid for any point on a demand curve, even if the elasticity varies continuously along the curve.

The essential idea in unit elasticity is that the change in quantity consumed resulting from a given change in price is equal to the change in price. If the change in consumption is greater than that in price, the demand is elastic; and if less it is inelastic. For practical purposes it is accurate enough to say that the elasticity of demand is unity if a 5 percent change in price causes a 5 percent change in consumption. But this form of statement is strictly accurate only for infinitesimal changes, not percentage changes; for a 5 percent change in an upward direction is not really equal to a 5 percent change downward. An accurate statement without recourse to calculus would indicate that the changes must be in reciprocal ratio. Thus a 5 percent increase in price will, if the demand has exactly unit elasticity, be associated with a change in consumption not from 100 to 95 but from 100 to $100/105$ of 100. If the elasticity is 2 and the price declines from 100 to 90, the quantity will undergo two successive changes in the reciprocal ratio of 90 to 100; that is, it will be $q \cdot \left(\frac{100}{90}\right)^2$.

Similarly, if the elasticity of demand is $1/2$, doubling the price will divide the quantity by $\sqrt{2}$; doubling the quantity will divide the price by 4.

Since elasticity is responsiveness of consumption to price, the causal relation in connection with elasticity is considered as running from price to quantity sold. This is purely arbitrary and reverses the notion underlying ordinary demand graphs, where quantity is measured along the base line and considered the independent variable. Either price or quantity may actually be the cause and the other the effect. Many branded commodities are put on the market at a

fixed price and variations in demand express themselves through variations in the quantity taken. With agricultural products, on the other hand, the supply once produced is thrown on the market and competition fixes the price that will dispose of it. There are even cases of the third conceivable type, where within limits both price and quantity are fixed and the demand as such is the variable, being manufactured by high pressure selling methods. The direction of the causal relation assumed in connection with elasticity is important because reversing it would invert the magnitude of the elasticity and produce a measure of what H. L. Moore calls the flexibility of prices. In many cases the inverse relation would be the more natural one to consider.

Since demand is the guide of production, it goes without saying that any reasonably reliable data on the magnitude and elasticity of demand and probable changes in it form the prime requisite for intelligent business management or for any possible social control. Thus the inelasticity of demand makes the problem of price control especially difficult: if any measure to raise prices meets with success and then if the price increase calls forth even a little increase in production, its effect is likely to be nullified or even reversed. The outstanding case in which the facts of elasticity give rise to a major public problem is that of agriculture, where the interests forcing attention are those of the producer; because of inelastic demand he is confronted with elastic price. Since the World War a relatively small overproduction has meant ruinously low prices.

In other fields of social control, too, the elasticity of demand is likely to be an important consideration. It is a common expedient to levy excise taxes on commodities of mass consumption considered luxurious or harmful, such as tobacco and alcoholic beverages, with the more or less dual objective of raising revenue and of reducing consumption and eliminating waste or damage to consumers. Obviously, the more inelastic the demand the more effective is such a tax from the revenue point of view and the less effective from that of control. Similar issues arise on an even larger scale in connection with customs duties, which serve the twofold purposes of revenue and protection. Since there is almost always some difference between the imported commodity against which protection is sought and the native product, the effects of the duty depend on the elasticity of demand for each as affected by substitution of the other and on the joint elas-

ticity of demand for both. In general, it is commonly agreed that in the very long run the effect of commodity taxes on the organization of industry is more important than their effect on individual incomes, since taxes on commodities are so largely shifted and ultimately diffused. The final effects of any such tax depend on the relations between elasticity of demand and elasticity of supply. The burden of the tax is finally divided between consumers and owners of resources which cannot move to other industries.

Elasticity of demand is closely related to the concept of monopoly of supply. It was early recognized that the more inelastic the demand for a commodity, the more profitable will be a monopoly in its production and the greater the incentive to attempt to secure a monopoly. In fact the connection between the two is much more intimate. The meaning of perfect competition is that the products of any number of other producers are a perfect substitute for that of any particular one. The demand for output of any particular competitive producer is infinitely elastic; at any price above that ruling in the market he can sell nothing and at any price below that ruling in the market he can sell an indefinite amount. Under monopoly there is a distinction between the products of different producers, which reflects itself in some degree of inelasticity in the demand confronting the single producer; this inelasticity measures the amount of his monopoly power, that is, power to raise price by restricting output. It does not matter whether the difference between the product of a particular enterprise and that of its competitors is a real difference in efficacy or in aesthetic appeal, a difference in social prestige conferred by the particular article, or a purely imaginary difference existing only in the mind of the consumer. Thus the significance of advertising, other than pure information regarding the physical character and properties of the product, and of other sales practises commonly referred to as creation of demand becomes clear. They strive to create in the minds of consumers a belief that A's razors, mouth wash, suits or what not are "different," and that those of B or C are not at all an acceptable substitute. When articles become too patently standardized to make this propaganda workable, as in a case like Portland cement, the producers typically form an association to build up the greatest possible psychological distinctiveness between their product and competing products of a different form and name.

FRANK H. KNIGHT

STATISTICAL DEMAND CURVES. In the ordinary use of the term, the demand curve for a commodity is a graphical statement of the relationship between the price and the rate of consumption or purchase of that commodity. The demand curve for a commodity may refer to the quantity purchased in any given market and to any price, wholesale or retail, which is representative of the prices which buyers in that market pay. The difficulty which confronts the statistician is that any single observation of the price and corresponding quantity of the commodity represents only one point on the demand curve. To obtain empirical evidence even for only the important section of the demand curve, a number of observations from a more or less extended period of time must be used, and during this period the demand curve may have changed.

It is interesting to observe that Cournot, who was the first to give a precise mathematical formulation of the demand function, was aware of the difficulties involved in arriving at statistical demand curves. He states that the law of demand "depends essentially on the magnitude of the population, on the existing distribution of wealth, on the tastes and habits of the consumers, on the multiplication of markets, and on the centralization of markets as a result of improvements in transportation. If all of these conditions relating to demand remain the same, and if we assume that the conditions of production change—the cost of production is raised or lowered, monopolies are restored or suppressed, taxes are increased or reduced, competition from abroad is prohibited or admitted freely—then prices will change and the corresponding variations in demand, if accurately set forth, can be used for the construction of our empirical tables. If, on the contrary, prices change because the law of demand itself has changed, because of a change in the causes which influence not only production but consumption, then the construction of our tables would be rendered impossible, since they must express how demand varies because of a change in price, and not because of other causes. And even when the change in the data seems to be caused by variations in the conditions of production, it is still to be feared that the law of demand itself has undergone a change in the rather long period covered by the observations in a country which has not yet achieved a fairly stationary state" (*Principes de la théorie des richesses*, Paris 1863, p. 100-01).

In the first edition of his *Principles* (1890, bk. iii, ch. iii) Marshall discussed the use of statis-

tical evidence in judging the elasticity of demand. He dealt at length with the difficulties resulting from the fact that "other things seldom are equal over periods of time sufficiently long for the collection of full and trustworthy statistics" and suggested how these difficulties might, in part at least, be met. But while Marshall's discussion indicates that he may have set up some sort of demand schedules or demand curves from statistical data and while he clearly has used statistical data in drawing conclusions as to the elasticity of demand for certain commodities, he does not present either tables or curves which purport to show the precise nature of the demand for any commodity as determined by statistical data.

If the difficulty confronting the statistician is to be overcome, a way must be found of eliminating from the statistical material the effect of those factors which change the functional relationship between consumption and price. Any other changes in the market situation present no difficulty to the investigator of demand curves. In fact, he can utilize only such statistics as reflect changing market situations; the observations he needs must comprise a wide range of either price changes or consumption changes or both. The demand curve which is the goal of the statistical economist is not actually "instantaneous," based on the "elimination of time" or on the assumption that "all other things are equal," as is sometimes maintained; it is static only in the sense that the influence of factors disturbing the relationship between price and consumption is supposed to be eliminated.

At the beginning of the twentieth century methods of correlation analysis were developed that proved to be useful tools in eliminating to some extent disturbing factors in the construction of demand curves. R. H. Hooker told in 1905 of a study which involved the correlation of first differences of corn prices in Iowa and of corn production in the United States (in *Royal Statistical Society, Journal*, vol. xlviii, 696-703). In 1910 Warren M. Persons reported similar studies (in *American Statistical Association, Quarterly Publications*, vol. xii, 287-322). Neither of these writers, however, claimed that the lines of regression of their correlation studies constituted empirical demand curves. They were followed by H. L. Moore and R. A. Lehfeldt, both of whom used correlation methods with an avowed purpose of obtaining demand curves, or "laws of demand."

Moore's methods have been essentially the

same as those of Hooker and Persons. The changing conditions of demand are dealt with partly through the use of data obtained by first differences, percentage changes, ratios to trend or similar devices in place of the original price and quantity statistics. These devices serve to remove the trend inherent in most production and consumption data and in addition to remove any trend which may exist in the price series. In addition, multiple correlation is used in order to take account of the effect of other factors which influence the law of demand and constitute "disturbing elements." The use of these methods marked a long forward step in overcoming the difficulties in the way of obtaining demand schedules.

Following this pioneer work a great deal of attention has been given to the statistical study of demand. Statistical demand curves have been obtained for a very large number of commodities and by many investigators. In general the different workers in the field have followed quite closely the methods used by Moore in his early studies. Whatever changes were introduced were adaptations due in part to significant advances in methodology and in part to the peculiar needs of different investigators or of different problems. Only the method recently propounded by Leontief is outstandingly different. Assuming that demand and supply curves do not change in shape in the course of time and that the simultaneous shifts of these curves are not correlated, Leontief derives by the method of least squares a pair of average demand and supply curves from the same statistical material. An indefinite number of pairs of curves may be obtained from a single set of data, but if the data are divided into two parts there is but one set of curves which is common to both parts of the data. The resultant set of unique curves is consequently dependent upon the arbitrary way in which the data are divided.

The data available for the construction of statistical demand curves are corresponding prices and quantities of the commodity in question. When plotted on coordinate paper each of the price-quantity points may be considered to represent a point of intersection of the demand curve and the supply curve. The scattering of the price-quantity points may be due to the fact that curves have shifted within the period for which the data have been used. If the supply curve shifts through a much greater range than does the demand curve, the resultant points of intersection will tend to group themselves about a sort of

average position of the demand curve. A line of best fit drawn through these points will approximate the average position and contour of the demand curve. Similarly, if the shifts of the demand curve are greater than those of the supply curve, the observations will tend to be grouped about an average position of the supply curve and a line drawn so as to pass through this group of points will tend to represent the average position of a supply curve. The use of unadjusted data, however, is apt to yield such a wide scatter of points that no line can satisfactorily be fitted to them.

The methods of Moore and of those who have followed him are much more likely to yield definitive results. A large part of the shifts in demand curves are due to increasing population, changes in consuming habits and other dynamic factors which result in a more or less continuous and regular year to year shift of the demand curve in one direction. The use of percentage changes, trend ratios or other adjusted data in place of the original data tends to remove the effects of these long continued shifts in demand. These methods also tend to remove the effects of long continued shifts in the supply curve. When applied to agricultural commodities, which because of varying yields exhibit wide year to year variations in the conditions of supply, they are likely to result in curves which approximate more or less closely the nature of demand curves. When applied to other commodities for which there are no such great year to year variations in the conditions of supply the result is not so apt to approximate a demand curve satisfactorily. Indeed, if the conditions of demand are subject to wide year to year fluctuations and the conditions of supply are not, the result may approximate a supply curve instead. This appears to have been the case with Moore's study of the relation between the percentage changes in the price and in the production of pig iron.

Whether the results obtained from dealing with adjusted data are an approximation to a theoretical demand curve or to a theoretical supply curve or represent merely an average line drawn through the points of intersection of demand and supply curves ("path of equilibrium" or "historical trajectory") cannot be ascertained a priori, and no general rules can be laid down in this connection. Two considerations, however, are relevant to an evaluation of the result. First, it is important to know whether the shifting of demand curves and of supply curves is correlated or independent. Second, it is necessary to ascer-

tain whether the adjustments which are made in the original observations in order to obtain a better defined path of equilibrium have not removed from the original data the very relationship for which the investigator is looking or have not distorted that relationship.

If the shifts of the demand curve are causally related to the shifts of the supply curve or vice versa, the statistical demand curve obtained will correspond to a demand curve of theory even though it will not have the same slope as the original shifting curve. If, on the other hand, the shiftings in the two curves are not causally related and if proper adjustment of the original data cannot be made to allow for these shiftings, the result will hardly resemble a true demand curve. This may be illustrated by the example of trading on a speculative market. When a change occurs in the fundamental supply and demand conditions—for example, if news of a frost in Iowa in early fall reaches the cash corn market—both the demand curve of buyers and the supply curve of sellers shift; when plotted on coordinate paper the demand curve shifts upward and to the right, while the supply curve shifts upward and to the left. The shifts in these curves, by reason of the fact that they represent the supply and demand curves of people who are buying and selling in speculative markets, are necessarily interrelated. If proper adjustment could be made for certain vagaries of demand, the path of equilibrium of these market demand and supply curves would result over a period of ten or twenty years in something approaching a short time normal demand curve for that market.

In considering statistical demand curves the effect of price upon consumption over long and over short periods of time must be clearly distinguished. Whether curves are obtained which correspond to the nature of market demand curves or of short time normal demand curves depends upon both the nature of the original data and the statistical procedure in handling them. It is doubtful, however, whether there is any statistical procedure by which one may expect to obtain definite information as to the nature of long time normal demand curves, i.e. curves which would show the effect of changes in price upon consumption under conditions in which the change in price is of sufficient duration for consumers to alter their consuming habits. For example, over a short period of time the demand for potatoes may be very inelastic; but if the price is raised and continues at a higher level over a period of years, the result may be that after

consumers become accustomed to the substitution of rice, bread or other commodities their consumption of potatoes will gradually be greatly reduced, indicating that the long time normal demand curve is elastic. There is little chance, however, that statistical methods can satisfactorily disclose the nature of this long time relationship. The trend must be removed from both the price and quantity series in order to make adjustments for the growth of population and changes in consuming habits unrelated to the changes in price; but the very removal of these trends removes from the data the evidence which they contain with regard to the effect of a long continued change in price upon consumption.

Another adjustment which may remove pertinent relationships from the original data is that of "holding other things constant" by means of multiple correlation. Thus in the example of corn one of the things which disturbs the relationship between its price and consumption is the change in the price of oats which results from changes in its production. The usual procedure would therefore be to include the price of oats as an independent variable in the multiple correlation and then to remove the effect of changes in the price of oats upon the changes in the price of corn. But the price of oats, in the United States at least, is very largely dependent, and causally dependent, upon the production and price of corn. Hence if the price of oats is "held constant" by means of multiple correlation, there is danger of removing from the fluctuation of corn prices a part of the variation which was actually due to changes in corn production.

There remains a considerable divergence of opinion as to what statistical demand curves actually represent and as to the best methods to use in obtaining them. Recent discussions, however, have brought about a better understanding of the true nature of these curves and have tended to lessen the differences of opinions as to their meaning. The probable consensus at present is that by careful analysis some sort of demand curve of theory can be approximated in the case of many commodities but that the closeness of the approximation is usually uncertain.

The various difficulties and uncertainties involved in constructing statistical demand curves make such curves almost useless unless they are accompanied by a large body of interpretative data indicating how they were obtained and therefore what they mean. In particular, a statement that certain commodities have certain elasticities of demand or the mere presentation of

the curves which have been obtained cannot rightly be used in reasoning about such effects of a tax or tariff or other measures as are supposed to be dependent upon relative elasticities of demand and supply. Ordinarily demand curves are derived from statistics merely as a part of an extended analysis of the price of a commodity. As a part of such analyses they are most useful for purposes of forecasting prices, determining desirable production programs and similar uses.

DÉMEUNIER, JEAN-NICOLAS (1751-1814), French sociologist and ethnologist. In the treatise *L'esprit des usages et des coutumes des différents peuples* (3 vols., London 1776), which established his position as a founder of comparative ethnology in the eighteenth century, Dèmeunier classified the accounts of travelers among "savages" and "barbarians" not simply according to countries, as had Prévost d'Exiles

in his *L'histoire générale des voyages* (1746–70), but according to a methodical outline of the folkways. In the introduction to his work Dèmeunier declared that his object was not to point out the “bizarre or ridiculous” in human customs but on the contrary to “discover their spirit” that “instead of inveighing against abuses we must study dispassionately their origins,” and that “no matter what the custom be, it had a cause as its principle.” Furthermore, he believed that explanations of these customs might be attempted only cautiously and only if the travelers’ observations were subjected to criticism. Like Charles de Brosses before him in *Du culte des dieux fétiches* (1760) Dèmeunier discovered relations between archaic and exotic folkways; he traced similarities in the political and social institutions of peoples as remote from each other in time and space as the natives of the Society and Friendly Islands, American aborigines and the Greeks, and maintained that they are caused by the similarity of “inspirations of nature.” That he was aware of peculiar differences among these customs as well as of their similarities attests the importance of Dèmeunier as one of the founders of sociology.

DEMOBILIZATION. *See* MOBILIZATION AND DEMOBILIZATION.

DEMOCRACY. No definition of democracy can adequately comprise the vast history which the concept connotes. To some it is a form of government, to others a way of social life. Men have found its essence in the character of the electorate, the relation between government and the people, the absence of wide economic differences between citizens, the refusal to recognize privileges built on birth or wealth, race or creed. Inevitably it has changed its substance in terms of time and place. What has seemed democracy to a member of some ruling class has seemed to his poorer fellow citizen a narrow and indefensible oligarchy. Democracy has a context in every sphere of life; and in each of those spheres it raises its special problems which do not admit of satisfactory or universal generalization.

The political aspect of democracy has the earliest roots in time. For the most part it remained a negative concept until the seventeenth century. Men protested against systems which upon one ground or another excluded them from a share in power. They were opposed to an oligarchy which exercised privileges confined to a narrow range of persons. They sought the extension of such privileges to more people on the ground that limitation was not justifiable. They felt and argued that exclusion from privilege was exclusion from benefit; and they claimed their equal share in its gains.

That notion of equality points the way to the essence of the democratic idea—the effort of men to affirm their own essence and to remove all barriers to that affirmation. All differentials by which other men exercise authority or influence they do not themselves possess hinder their own self-realization. To give these differentials the protection of the legal order is to prevent the realization of the wishes and interests of the mass of men. The basis of democratic development is therefore the demand for equality, the demand that the system of power be erected upon the similarities and not the differences between men. Of the permanence of this demand there can be no doubt; at the very dawn of political science Aristotle insisted that its denial was the main cause of revolutions. Just as the history of the state can perhaps be most effectively written in terms of the expanding claims of the common man upon the results of its effort, so the development of the realization of equality is the clue to the problem of democracy.

This is indeed to state in a general way what is more usually seen in narrower terms. There have been times—in England, for instance, in the nineteenth century—when democratic government was largely taken to mean the extension of the suffrage. At other times, as in Oregon in the early years of the present century, the participation of the people in the process of government by means of the initiative and the referendum seemed that indispensable condition without which democracy was a shadowy figment. Others have made it depend upon the power of the majority to have its way. The basis of the feminist movement was the claim that so long as women are excluded from full and direct participation in political life democratic government cannot be said to have been realized. The number of political mechanisms, from proportional representation to the direct primary,

upon which alone a democratic government has been held to be valid is very large; but analysis of them will show that at bottom the effort of their proponents has been to prevent the operation of a policy which excludes some people from the benefits of the state. They have in fact been aiming at the realization of some form of equality not previously acquired.

It is because political equality, however profound, does not permit the full affirmation of the common man's essence that the idea of democracy has spread to other spheres. The discovery that men may be politically equal without attaining a genuine realization of their personalities was seen by not a few during the Puritan revolution, and the demand for economic equality was loudly and ably voiced there by Winstanley and his followers. It was only, however, with the French Revolution that economic equality may be said to have become a permanent part of the democratic creed. From that time, particularly in the context of socialist principle, it has been increasingly insisted that in the absence of economic equality no political mechanisms will of themselves enable the common man to realize his wishes and interests. Economic power is regarded as the parent of political power. To make the diffusion of the latter effective, the former also must be widely diffused. To divide a people into rich and poor is to make impossible the attainment of a common interest by state action. Economic equality is then urged as the clue upon which the reality of democracy depends.

The demand for social equality is both older and more recent than that for either political or economic equality. Protest against the possession of privilege by birth goes back to a very early period. So also a refusal to accept the status of inferiority which slavery implies is probably as old as slavery itself. Each of these is a somewhat crude form of the demand. More subtle are claims to religious equality, to educational equality, to that equal participation in the results of social discovery which is marked by the development of communal efforts toward the improvement of health and housing, the provision of public libraries and recreation and so forth. There is, it is maintained, a kind of eminent domain which entitles the state deliberately to intervene to mitigate the consequences of social inequality. This claim is important, because the method on which it relies—taxation as a rule, but on occasion expropriation, whether revolutionary or otherwise—has the inevitable

effect of producing a simultaneous approach to economic equality, and it is significant that the use of this method should, as a rule although not invariably, be one of the consequences of the attainment of political equality. Included in this aspect also is the idea of equality before the law. The proponents of democracy affirm that in the courts of a state there can be no difference between persons: poor and rich, atheist and Christian, black and white, must in similar circumstances be treated similarly by the law. And what is interesting in this context is the early affirmation that a legal equality which remains purely formal is necessarily unsubstantial. It is found that access to the courts is a matter largely dependent upon economic position; and a demand is soon made for equality in those realms which give reality to that access. Since also the legal doctrines of a court mainly take their color from the character of the prevailing economic order, the demand for economic equality in order that these legal doctrines may bear equally upon all becomes a normal social feature.

The case for democracy is built upon the assumption that in its absence men become the tools of others, without available proof that the common good is inherently involved in this relationship. The case at bottom is an ethical one. It postulates that the right to happiness is inherent in man as a member of society and that any system which denies that right cannot be justified. The main argument in its favor is the important one that in any social order where it has not been accepted a rational analysis finds it difficult to justify the distribution of benefits which occurs. Most arguments against it indeed, like those of Plato in the *Republic*, have been less concerned to deny its postulate than to affirm that the end it seeks cannot be attained by the method of democracy. Yet as a rule that criticism has concealed the unstated major premise that the opponents of democracy know better than the common man what is good for him and are prepared to supply him with it. It is this major premise which historic experience seems to refute. It may be, as Rousseau said, that it is the tendency of all governments to degenerate; certainly in no system of government has power been entrusted to a few without subsequent confusion by that oligarchy of its private good with the public welfare; and revolution has frequently been provoked by the inability of the oligarchy imaginatively to meet the wants it has encountered.

Organized democracy is the product of urban life; it is therefore natural that it should have made its first effective appearance in the intense political activity of the Greek city-states. It was of course a limited democracy based on slavery; and in no Greek community did free citizens constitute the majority of the inhabitants. The conditions of its emergence were for the most part economic; at Athens, for example, where the city's wealth was so largely dependent upon overseas trade, a recognition of the importance of the seafaring class in the state was unavoidable. But, generally speaking, democratic ideas did not commend themselves to the major thinkers of Greece. Either, like Plato or Isocrates, their outlook was definitely hostile to democracy or, like Aristotle, they accepted it only with severe limitations. Yet Aristotle recognized the validity of a large part of the democratic case. For him the claim of numbers is vital; he admits that the demand for equality is inescapable; and his analysis of the causes of revolution is nothing so much as a eulogy of the career open to the talents. It is clear enough that his wise and calm mind was impressed by the inherent virtue of a system which without being extreme prevents the undue concentration of power in a few hands. His notion of citizenship too implies a continuous and active interest in affairs of state. His admiration for polity is clearly an acceptance as adequate of at least the foundations of Athenian democracy.

The system broke down largely because the Greek mind never recognized the urgency of pan-Hellenism and partly because the passion for equality at Athens never permitted the creation of an executive strong enough to act vigorously in foreign affairs. Yet internally at least Greek democracy displayed astonishing merits. The life and property of the citizen were generally secure. The importance of order was realized. The sense of civic obligation was high and pride in civic achievement was great. Intolerance did exist, as the classic cases of Socrates and Aristides make clear, and a jealous particularism which, as in the tragedy of Melos, ultimately created a legacy of hate that left Athens helpless before the military genius of Macedon. Yet one of the ultimate lessons of the Athenian democracy is the power of equality to maintain a government of free men.

After the fall of Athens any effective experimentation in democracy ceased until modern times. Rome had a genius for government; but the democratic element in its system was nomi-

nal even in republican times and non-existent in imperial. Military necessity won political equality for the plebeians; but there was no real democratic character in the executive power. The legislative authority of the *comitia* testified to the recognition of the significance of numbers in the state; but this was so hedged about with restrictions as to be but partially effective. The *lex hortensia* of 287 B.C., which nominally made the enactments of the *concilium plebis* binding on the whole people, was important only theoretically. The senate retained the substance of power until authority passed into the hands of the emperors.

Roman democratic ideas are shadowy in a similar way. The Roman stoics show an appreciation of equality. Cicero, Seneca, Gaius and Ulpian are all at pains to establish an original equality of men and to appeal to a law of nature which gives them an equal claim to consideration. But the inference is less political than moral, the duty to be humane rather than the obligation to be democratic. The idea led to legal improvements, especially in the conditions of slaves; but its practical political consequences were not immediately important.

Yet when the stoic idea met and was fused with Christianity it gave birth to a theory of human rights which, had it been applied, would have revolutionized the world in a democratic direction. Early Christian documents insist on the equality of men; they emphasize the idea of property as a trust which must be exercised on behalf of the whole community; and their attitude to slavery contained at least the germs of its overthrow. We must not indeed press any of these elements too far. Because Christianity began as a doctrine of the disinherited, its statesmen, especially St. Paul, insistently emphasized its practical limitations. Their equality was spiritual and not legal. They urged the duty of obedience to constituted authority. They discouraged any attempt to bring out the revolutionary elements implicit in their faith. And once Christianity had been formally adopted as the religion of Rome, the position of the church as a great property owner increasingly anxious for endowment made it an instrument of social conservatism rather than of change. Its importance for democratic theory lay in the future, when it could seem to bring the support of supernatural validity to humble men's claims to a share in the direction of affairs.

Mediaeval conditions contributed ideas of far more practical importance. If the practise of

democracy was largely dead, implicit in mediaeval life were notions important for later theory. At the basis of feudalism lay the idea of contract; and this made universal the assumption that the rights of a lord depend upon the fulfilment of his duties to his tenant. The influence of this was far reaching. It is obviously easy to argue that the king as the supreme overlord owes a duty to his people as the condition of their allegiance; the coronation oath can then be interpreted as a pledge he is not entitled to break. Conflict between various authorities, especially between church and state, then naturally gives rise to the idea of a social compact. So Manegold of Lautenbach, in the struggle between Gregory VII and Henry IV, puts forward an idea of popular right. For him the king must honor divine law, obedience to which is the *pactum* giving validity to his rule. To act unjustly is then to break the compact, and this absolves a people from its allegiance. The theory of course was conceived in the interest of papal authority, and this is true of much of the doctrine which takes a similar view. Where John of Salisbury praises tyrannicide, where Aquinas explains the differing claims of good and evil monarchs, each is in fact discovering an avenue to papal supremacy. But each is also, however imperfectly, insisting that power must be limited in the interest of the governed, and new experience was to make the idea a fruitful one in later times.

Two other mediaeval notions were important. The discovery of the idea of representation solved a problem of governance which baffled classical times. Probably ecclesiastical in origin, it was fully transferred to state affairs by the thirteenth century. Its implications are obvious. If interests are to be represented, of what interests is the representative body (or bodies) to be composed? Phrases come to us like the famous *Quod omnes tangit, ab omnibus approbetur*, which show a sense that the exclusion of an interest may make the representation of a body imperfect; and thinkers like Marsiglio of Padua (with the experience of Italian cities in his mind) and William of Ockham are prepared to press the view to its logical conclusion. They failed practically, but the contribution of the idea of representation to democratic theory was a claim that those excluded from the making of decisions cannot be bound by them. The idea of representation was of seminal importance because it gave those excluded from a share in the organs of government the opportunity of griev-

ance. When social conditions became sufficiently developed this grievance could take the form of a protest against privilege; and in that notion lies the seed of modern democracy.

It is, finally, important that the Middle Ages had no clear conception of sovereignty. The idea of a legally unlimited will was wholly alien to its way of thinking. From the lowest to the highest, men are bound by a hierarchy of laws in which divine law is the summit. This in the long run promoted popular rights by obviously emphasizing the idea of constitutionalism. And the effort to find institutional means for expressing this view may fairly be described as universal. It is the root idea of Magna Carta; it is the essence of Aquinas' insistence on an elective monarchy; it underlies the curious modernity of Marsiglio; it is the basis of the decree *Frequens* of the Council of Constance which sought to put a term to papal autocracy. The absence of sovereignty meant that authority could be regarded as a trust, capable of revocation when it was subject to abuse. The Peasants' Revolt of 1381, the so-called Lancastrian experiment of the fifteenth century, even the Hussite rebellion, all show how deeply that notion had spread. All of them were premature in the sense that conditions as yet made their translation into institutional form impossible. But all of them were vital because they showed how easily they might be utilized for democratic ends in a suitable environment.

Broadly speaking, that suitable environment may be said to have emerged in the sixteenth century when religious schism coincided with economic and geographical change. The synchronism of Protestant creeds with a new capitalist economy was not fortuitous. It gave a new significance to individualism. The fight for toleration in the religious field was paralleled by a fight for freedom of economic and political action. Most reformers were not democratic in any large way, but to establish the right of their faith to exist unhampered they were compelled to attack the absolute state. The sixteenth century is full of discussion of the right to rebel for conscience's sake. Knox and Buchanan in Scotland, Ponet and Christopher Goodman in England, Beza and the author of the *Vindiciae contra tyrannos* in France, are only a few of the outstanding political thinkers of the period who sought ways and means of limiting monarchical authority in the interest of different political sects. Special circumstances forced the Jesuits to defend a curiously similar position; and men

like Mariana and Bellarmine were unconsciously advancing the rights of the people when they sought new weapons in defense of their church.

The sixteenth century for the most part sought to delimit the authority of the prince in the interest of churches. The main impact of the seventeenth century was in England and Holland and consisted in the defense of constitutional government against absolute prerogative. The defense was important because the tendency of the century was all the other way. In Holland it produced in Johannes Althusius a remarkable defender of a liberal federalism in which sovereignty is squarely based upon popular approval. In England civil war and revolution established the principle that Parliament is the essential lawmaking body, and the defense of Parliament was built upon its supposed representative character. The English experience is noteworthy because a revolutionary atmosphere produced among the Levellers extreme democratic views like those of John Lilburne (the true forerunner of Chartism) and extreme democratic communism like that of Gerrard Winstanley. The broad result was summed up in Locke, who gave to the English constitution the peculiar flavor of middle class liberalism it has retained ever since. Kingship became dependent upon Parliament; and we can trace to this epoch the beginnings of the transfer of effective power from the landed aristocracy to the trading bourgeoisie, which was not finally emphasized until the Reform Act of 1832.

France moved more slowly. She had her democratic thinkers in the seventeenth century, notably Claude Joly and Pierre Jurieu, who inferred from the wars of the Fronde and the revocation of the Edict of Nantes respectively that the people should be the effective basis of power. But a serious democratic theory on any considerable scale did not develop in France until the eighteenth century. Then the combination of an inefficient monarchical absolutism with religious bankruptcy and a functionless *noblesse* produced a widespread protest. In some, as with Voltaire and Diderot, the main claim is protection of the individual against the invasion of arbitrary power. Others, like Montesquieu, demand a constitutional system. Others again, like Mably and Morelly, depict communistic utopias as the only effective remedy for social ills. Rousseau sounded a deeper note and denied the legitimacy of all government in which the general will of all the people was not the effective lawmaking power. The *philosophes* did not make

the revolution of 1789; that was the product of misgovernment and bankruptcy. But they made the people aware of their wants. They made a regime of privilege no longer possible, once the Estates General had been convoked. And the French Revolution may be said to have contributed to democratic theory the insistence that the career must be opened to the talents, which was, whatever its limitations, a denial that birth or race or creed can bar the road to equality.

Political thinkers of the nineteenth century differed from their predecessors in that they confronted a condition rather than a theory. They were less concerned to defend an ideal than to discover the fitting means of its operation. Thomas Jefferson in America, Jeremy Bentham and the Mills in England, Alexis de Tocqueville in France, are the outstanding names in a notable procession. There is no common agreement among them upon essential principles. Jefferson, for example, exemplified the faith of the relatively simple agrarian community from which he came. His democratic ideas are those of a man who suspects all exercise of power and seeks above all the fullest means of its control. Bentham's view is that of a lawyer who sees sinister interests at work and finds in liberty of contract and universal suffrage the methods whereby the greatest happiness of the greatest number may be attained. John Stuart Mill saw deeper into the manifold complexities of the problem. But it cannot be said that his demands for full freedom of expression, co-partnership in industry and proportional representation did more than signalize the directions in which events were tending. In many ways the analysis of de Tocqueville is the most outstanding performance of them all. He saw more clearly than anyone else that the inherent principle of democracy is equality and that its consequence must necessarily be the use of the state to minimize the differences between men. In a sense he prophesied the course of legislation in the western world for the following century.

The history of democratic thought has thus centered about two problems—the effort to establish the right of the whole community to share in the direction of the state, and the means of attaining this diffusion of power. The widespread acceptance of the democratic ideal obviously implied acceptance of the possibility that social arrangements were a matter of deliberate human invention. For this three conditions were necessary, and it is in the interrelations of these three that the development of democratic thought

may best be understood. (1) The secular state had to be divorced from the ecclesiastical community. This was effected partly by that complex of causes called the Reformation and partly by the erosion, through scientific discovery, of belief in supernatural sanctions. (2) The feudal notion of social relations had to be replaced by the contractual. This was effected by the commercial revolution which transformed social classes slowly between 1400 and 1750 and with increasing rapidity since that time. (3) Popular ignorance had to be dispelled, partly by the growth of literacy and partly by the evolution of a consciousness of power in the masses which would enable them to know both what they wanted and how to organize for its attainment. Largely this was the outcome of nineteenth century development. Popular education slowly achieved the first, and economic organization, especially in the form of trade unionism, did most to secure the second.

The struggle for the attainment of democratic institutions has taken forms as various as the conditions it encountered. The eighteenth century popularized three ideas. English experience led to the belief that parliamentary government is the parent of civil liberty. The American Revolution made popular the notion that a discontented people has the right to cashier its governors. The French Revolution established the principle that autocracy is the necessary parent of special privilege. Nineteenth century democrats attempted to find institutional expression for these ideas. And the stress of a new and intensified system of production, in which rapidly increasing and concentrated populations had to be satisfied, necessarily increased the rate of progress toward democratic institutions.

Sometimes the demand was for the establishment of representative institutions, as in Germany; sometimes for the extension of the franchise. In the first part of the century the English system became the model for peoples struggling to be free. In its latter years Swiss democracy became the fashion; the representative system was criticized as leaving the member of Parliament the master of the electorate between elections. This led to an enthusiasm, most notable in western America, for direct government; and every constitution sought to embody the initiative, the referendum and the recall as the necessary safeguards of a democratic state. America indeed specialized in experiment in technique. The short ballot, the recall of judges, the direct primary, all were at one time or another urged

as seminal contributions to the problem of discovering appropriate forms. At one time the question of a second chamber aroused wide interest. At another proportional representation was put forward as the highroad to salvation.

The importance of machinery has been emphasized by another factor. A state which numbers its population by millions cannot decide upon its purposes without government by parties. "Party organization," as Bagehot said, "is the vital principle of representative government." Without the party system in some form it is impossible to get that concentration of voters for decision which is essential with electorates of the modern size. But parties, inevitable as they are, have brought in their train a host of complex problems. The method of choosing candidates, the proper size of a constituency, the prevention of corruption, the exact powers which an elected member should exert, the representation of minorities, these are only the outstanding issues for which suitable machinery has to be devised. And, broadly speaking, it may be said that the experience of party government in the last seventy or eighty years has rendered obsolete most of the simpler views of democratic government. Bentham could urge that universal suffrage would prevent the emergence of sinister interests; no one thinks so now. The Chartists could insist that the ballot and annual parliaments would enable the popular will to find its way to the statute book; it is now clearly seen that they greatly oversimplified the problem. As Halifax said some two hundred and fifty years ago, "the best kind of party is in some sort a conspiracy against the nation." In this context questions of electoral machinery become urgent if the end of democracy is to be attained. And it cannot as yet be said that their satisfactory solution is in sight.

Ever since the French Revolution there has been a close connection between democracy and nationalism. The attainment of unity involved the conquest by the nation of the panoply of the sovereign state, and the step thence to empire was a small one. Now empire for the most part meant the control of colored peoples by the white race—the Philippines by America, India by Great Britain, Java by Holland, Indo-China by France. With the close of the nineteenth century came a democratic awakening which infected not merely colonial territories of this kind but also ancient empires like China. The main proponents of democratic theory had for the most part taken the younger Mill's view

that the idea of democratic government suited only the habits of advanced and, essentially, white peoples. Its adaptation to non-white civilizations was fiercely resented. It meant the surrender of political power by the whites and often of an economic dominion based on political control. Great Britain, for instance, might yield control gracefully enough in Canada, South Africa or Australia; its surrender in India was a different matter. For the withdrawal of control meant the possible jeopardy of great interests built up on the faith of its continuance. It disintegrated economic and political habits to which great importance had become attached. It challenged, at least contingently, that domination of the world by the white man which to most nineteenth century thinkers had been almost an unconscious axiom. It would not be unfair to say that most democratic thinkers found it difficult to apply their philosophy to people of a different color. The latter in their turn found the postulates of the democratic creed unanswerable. Great Britain, for instance, found herself in the dilemma either of granting to India institutions for which she believed it to be dubiously suited or of attempting to suppress demands which could only be resisted with naked force. To use such force meant not only to divide her own public opinion; it meant also to threaten her own economic well-being in India. *Mutatis mutandis*, the situation was true elsewhere; and the question was posed to the twentieth century whether democracy and empire are compatible at all and if they are whether the compatibility does not mean sooner or later the abandonment of effective control by the suzerain of its authority over its dominions. Turgot's maxim that colonies are like fruit upon a tree which falls as it ripens seemed to summarize the general history of this relationship; and the democratic notion hastened the proof of its universality.

Democratic government during the nineteenth century may be said to have been successful so long as it confined its activities to the purely political field. While it occupied itself with matters of religious freedom, formal political equality, the abrogation of aristocratic privilege, its conquests were swift and triumphant. But the attainment of these ends did not solve any of the major social and economic issues. The masses still remained poor; a small number of rich men still exercised a predominant influence in the state. With the grant of the franchise to the workers therefore a movement toward col-

lectivism was inevitable. Political parties had to attract their support; the obvious method was to offer the prospect of social and economic legislation which should alleviate the workers' condition. And from the early days of the French Revolution there had appeared the portent of socialism with its insistence that only in the rigorous democratization of economic power could a solution to the social problem be found. Incoherent at first, the development of trade unions and the growth of doctrines like that of Marx made what seemed visionary utopianism into a movement. By the eighties of the nineteenth century socialism could represent itself as the natural and logical outcome of democratic theory. It could outbid the older parties on ground which universal suffrage had made the inevitable territory of conflict. In the opening years of the twentieth century the central theme of debate had become the power of the state to satisfy the economic wants of the working class.

The war supervened to give this new evolution the sharpest possible definition. No democratic system met its challenge effectively. Openly or covertly every belligerent state organized itself for war in terms of a more or less extensive dictatorship. The questions were asked whether democracy had that inherent efficiency necessary to cope with its problems, whether the social question could be solved through the forms of classic democracy, whether disparities so vast as those revealed in the most advanced society could be bridged in terms of peaceful evolution. The conquest of Russia by Marxian socialism brought to power a body of men for whom political democracy was an unedifying mirage. They insisted that the democratic state merely means the dictatorship of the capitalist; that he would never peacefully yield his power; that it must accordingly be taken from him by a revolution in which the working classes would, through the dictatorship of the proletariat, seize the state and control the means of production in the interest of the masses. Democracy for them was an ideal incapable of realization until the power of property had been overthrown. It was only when men were economically equal through the successful socialization of the means of production that a thoroughgoing dictatorship could be abandoned.

In the feverish post-war atmosphere the dramatic Russian experiment exercised a wide fascination, and its communist theory became the most complete challenge to the democratic prin-

ciple since the French Revolution. Attempts to imitate it were frequent, notably in Hungary and Germany. Inevitably also it produced its antithesis, expressed in various forms, of which perhaps the most striking is the Fascist dictatorship in Italy. But underlying them all is a common philosophy based on the rejection of all democratic principles as involving an anarchy incompatible with the vigorous organization required by the state. These principles, it is claimed, destroy the unity of the state. They dissipate in discussion the energy which is needed for action. Parliaments are overwhelmed with work so that rapidity of action is impossible for them. The average man is too incompetent and uninterested in the issues which must be decided to have an effective opinion about them. The technicality of modern problems means government by the expert; and democratic methods are held to be irrelevant to his decisions.

Many factors have contributed to this outlook. The fractionalization of parties, as in France and Italy, the habits of violence engendered everywhere by the war, the new intensity of nationalist faith, the failure to adapt democratic political procedure to new conditions, the gravity of the economic crisis in the post-war period, are all causes of importance. But the underlying principle of Fascism is pretty clearly the defense of the power of the middle class against the onslaught of the masses. It is the outcome of the realization that the trend of democracy is to fasten an increasingly heavy economic burden upon the comfortable; and the dictatorship it establishes is a deliberate effort to mitigate this condition. How far it is likely to be permanent no one can say. The ability of democracy to survive the dual attack of communism and Fascism will obviously depend upon its ability to adapt its mechanisms and principles to a changed world.

Not indeed that the protagonists of democracy are unaware of the malaise. The last twenty years have seen a notable change in its perspective. In the years before the war attention was mainly devoted to questions of machinery like the referendum and the recall; and the post-war constitutions, especially those of the new European states, showed a curious enthusiasm for mechanical devices intended to give the electorate its maximum authority.

But since the war the theory of democracy has far outstripped its practise. Few thinkers now interpret its problems in Benthamite terms. The notion that political equality will give birth

to liberty in its different aspects is nowhere widely held. While there still remain, especially in England, men to whom the adoption of proportional representation remains the major political reform, continental experience of its operation has everywhere dimmed its attractions. The major currents of democratic theory set in other directions. Their emphasis now is upon equality of economic opportunity. This involves the insistence that social income must definitely be used to prevent undue disparity between man and man in all the major activities upon which the good life depends; and the state appears as the institution which deliberately uses the taxing power to achieve this purpose. The good life is unattainable where there are wide economic disparities between classes.

From this further consequences flow. If the hypothesis of self-government is valid in the political sphere it must be valid in the economic sphere also; whence is born the insistence upon constitutional government in industry. Not only must the state interfere to this end in the general details of economic life, but it cannot realize its end if the operation of the profit making motive is admitted in any industry of basic importance to the community. The new ideals of democracy therefore foreshadow a functional society in which the older conception of liberty of contract has no place. Any state in which the economic sphere is left largely uncontrolled is necessarily a class society tilted to the advantage of the rich; it lacks that necessary basis of unity which enables men to compose their differences in peace. The claim for the sovereignty of the state no longer rests upon the strong basis provided by the old liberal hypothesis of a society equal in fact because formally equal in political power. Largely the new democratic theory accepts a quasi-Marxian interpretation of the state while refusing to draw therefrom the inference that revolution is its only satisfactory corrective.

But in order to achieve a functional society in effective terms the new democratic theory calls for a thorough overhauling of existing institutions, particularly on the political side. Here we can only suggest in brief outline the direction of its thought. (1) It is hostile to the idea of the national state as the final or chief unit in social organization. The economic interdependence of the modern world makes it regard the state as essentially a province of an international society to which alone in ultimate matters essential authority can belong. (2) It regards the classic theories of parliamentary and presidential gov-

Encyclopaedia of the Social Sciences

ernment as unsatisfactory. They represent a response to the social conditions of the nineteenth century rather than of our own day. The basis upon which it demands revision is three-fold: (a) it looks to a large measure of territorial decentralization; proper areas of local authority must not be unduly fettered by central control; (b) it looks to a large measure of economic federalism; for it the cotton industry and mining are entities of government as real as Lancashire or New York, which need their own inherent organs of constitutional government; (c) it desires reorganization of central government in order to associate with the making of decisions all interests which are likely to be affected by them. Its view therefore of the institutional structure of the twentieth century is of a pattern far more complex than was envisaged by men like Jefferson or Bentham or Mill. It does not believe that this institutional reconstruction can be postponed in either the international or the national sphere if democracy is to be made capable of effective realization.

At the base of this view is clearly the old democratic notion that the only way to respond to the wants of the individual is to associate him with the process of authority. It accepts therefore the old claim that exclusion from a share in power is also exclusion from a share in benefit. It regards the right of men to share in the results of social life as broadly equal; and it regards differences of treatment as justifiable only in so far as they can be shown to be directly relevant to the common good. It takes its stand firmly on the need for a close economic equality on the ground that the benefits a man can obtain from the social process are, at least approximately and in general, a function of his power of effective demand, which in turn depends upon the property he owns. It is thus hostile to all economic privilege as being in its nature fatal to the end at which a democratic society must aim. For the new democratic theory liberty is necessarily a function of equality.

And it therefore seeks the institutions appropriate to an egalitarian society. That is why it refuses to confine the ideal of democracy to the purely political sphere. It believes that for the average man constitutional government is not less important in industry than in politics or any other sphere. What Michel called the "eminent dignity of human personality" cannot in its view be protected upon any other terms. The essence of democracy on this hypothesis is full consultation before decision; and the discovery

of the organs which will make that consultation effective is therefore of paramount importance. On such a view also the central government, in the ordinary meaning of the term, has less than the importance attributed to it in previous theories. It becomes a final method of coordination rather than an originating source of command. Society is transformed into a system of centers of authority, each of which is urgent and significant, rather than into a pyramid in which the central legislative assembly accretes all power to itself. This theory is incompatible with the classic view of parliamentary sovereignty; it tends much more to the notion of spheres of competence laid down by a constitution which is supreme over the bodies dependent upon its authority.

The new trend of democracy is not less hostile to dictatorship in any form than the old. Whatever the original purpose of dictatorship, history indicates that it cannot avoid degeneration; and when that occurs the benefits of the dictatorship are bound to be confined to those who share in its operation. Further, modern democratic theory is built upon the notion that the only way of responding to the wants of total experience in modern communities is to give that experience the full opportunity of expression; and the only way to give it that freedom is to offer it in its various aspects the responsibility of sharing in power.

One final remark may be made. It is not the view of modern democratic theory that a political man can be constructed whose interest in the public business of the community is assured. It does believe that increased educational opportunity will increase that interest; a belief which further emphasizes the need for equality. It does argue further that the main result of inequality is so to depress the moral character of those at the basis of the social pyramid as to minimize their power to get attention for their experience. Again therefore it sees in equality the path to the end democracy seeks to serve. It has far less assurance than in the past that the end may be attained, but it is not less convinced than its predecessors of the nobility of the ideal.

DEMOCRATIC PARTIES. See PARTIES, POLITICAL, sections for separate countries.

DEMOGRAPHY. The term demography is best established in France and Italy. The Germans and Scandinavians make slight use of it, and it has never attained to general usage in the English speaking countries. Internationally, however, the term has secure standing in the international congresses of hygiene and demography and the International Statistical Institute. It was first used by Achille Guillard in his *Éléments de statistique humaine ou démographie comparée* (Paris 1855), who regarded it as the mathematical knowledge of the general movements and of the physical, social, intellectual and moral conditions of populations, or still more broadly as the natural and social history of the human species. Levasseur defines it simply as the science of population, a science which ascertains the state and studies the movements—chiefly births, deaths, marriages and migrations—of population and which endeavors to discover the laws which control these movements. Such a definition on the one hand suggests the historical evolution of demography from the political arithmetic of Graunt, Petty and Süssmilch and on the other its near relationship to modern vital statistics. In fact, Whipple regards demography as in a narrow sense synonymous with vital statistics, but also states that broadly it is “the statistical study of human life” and includes not only census and other data on the state of the population and the population movements usually recorded and analyzed in vital statistics but also genealogy, eugenics, anthropometry and statistical pathology. Such broad inclusion of content as that indicated in the latter definition should be avoided. On the other hand, demography should be defined to comprise more than vital statistics. The study of the latter, properly delimited, is concerned with the movement of population (*mouvement de la population*, *Bevölkerungsbewegung*) as revealed in the statistics of birth, marriage, divorce and death and is concerned with the state of the population (*état de la population*, *Bevölkerungsstand*) only to the extent that statistics of the state of the population afford basic data for the study of the vital movements. Despite the objection of von Mayr in his *Bevölkerungsstatistik* (Freiburg 1897) that the term is redundant if used as synonymous with population statistics, demography may be defined as the numerical analysis of the state and movement of human population inclusive of census enumeration and registration of vital processes and of whatever quantitative statistical analysis can be made of

the state and movement of population on the basis of fundamental census and registration

Demography may thus be regarded as a kind of biosocial bookkeeping, a continuous inventory and analysis of the human population and its vital processes, collectively considered. There are two phases to demography, a static and a dynamic. The first ascertains and describes the state of the population. This is the function of census enumeration and analysis, which are not only exceedingly important and useful in their own right but are an indispensable basis for all studies of the movement of population, or vital statistics. In the calculation of density of population, division between urban and rural population and the like, static demography and geography come into close contact, although the fruitfulness of the cooperation between them is lessened by the fact that the census of population is necessarily made by administrative units rather than by cultural areas or natural regions. The dynamic phase of demography has as its function the statistical analysis of the movement of population. This includes both the physical movement of individuals from one place to another (migration and settlement), in the study of which demography again comes into contact with geography and also with economics and history, and the biosocial processes: births, deaths (including infant mortality, deaths at specific ages, causes of death, etc.), marriages, divorces, morbidity (where data are available) and natural increase or autogenous growth. But for the fact that dynamic demography includes migration it could be considered as coterminous with vital statistics. The absolute numbers of the population as a whole and by various classifications of age, sex, conjugal condition and the like are not without significance, not only as basic data for analytical purposes but per se. In most population literature, however, absolute magnitudes have been neglected and the major attention has been given to comparative rates. The central theme of vital statistics and of the demography of population movement is indeed that of the comparative rates at which the various vital processes take place. Birth, death and marriage rates are always ratios derived from the absolute number of the population (actually enumerated or estimated) and the absolute number of births, deaths or marriages recorded for that population in the period under consideration. Calculation of such rates, with various degrees of refinement (for instance,

fertility rates per thousand married women of child bearing age, specific death rates, life tables), is essential to any scientific comparison of the movements of two different populations or of the same population at different times. One must then distinguish descriptive demography, which includes the basic data of census and registration statistics; analytic demography, which includes all the statistical analysis of these data, as well as the calculation of rates; comparative demography, which includes the comparison of the status and movement of different populations at a given time; and historical or genetic demography, which deals with time series of demographic rates.

Aside from its scientific and sociological interest demography has indispensable, practical uses. Demography is a sine qua non of all intelligent public health work and is of much service to medicine in general (*see* Prinzing, F., *Handbuch der medizinischen Statistik*, Jena 1906). Detailed knowledge of the incidence of death, by age, sex and cause, is the foundation of life insurance. Business needs the services of demography in a variety of ways but especially in market analysis; and national economic life at large would be saved some costly maladjustments if more attention were paid to analysis of population movement. Public service economy, especially, demands accurate analysis and prediction of the growth or decline and the geographical shifts of population.

DEMOLINS, EDMOND (1852-1907), French sociologist and educator. Demolins was born in Marseille, the son of a physician, and was a student at the Jesuit college of Mongré. He

came to Paris in 1873 to write a history of French society in answer to the aristocratic prejudice that the common people had contributed nothing to the fame and greatness of France. In *Le mouvement communal et municipal au moyen âge* (Paris 1875) and *Histoire de France* (4 vols., Paris 1879-80) he followed the descriptive method of Augustin Thierry. After 1880 he became interested in social science and Catholic social reform in the tradition of Le Play, who had examined the condition of working men in Europe empirically and represented the demand for a social policy since 1864. Demolins turned his attention in the direction of popularizing his ideas on a new patriarchal organization of factory life and a moral strengthening of the family by founding in 1881 the magazine *Réforme sociale*, and from 1884 on by giving regular courses of lectures on social science in the halls of the Société de Géographie. As a consequence of his discussions with the abbé Henri de Tourville, who wished to develop Le Play's doctrine from investigation and monograph into a practical method, Demolins withdrew from the *Réforme sociale* and founded the *Science sociale* in 1886. The chronicles on social and political interrelations, which first appeared in the feuilleton of the *Univers* (1875-82), he continued in a series of many sided studies of rural population, of herdsmen's families, of miners and factory workers and of Russian and French types, unfolding in this way the program of a social geography. He also applied the method of social science to studies of the baking and slaughtering industries in Paris and supplemented them by historical works on trade.

Demolins' popular work, *À quoi tient la supériorité des anglo-saxons* (Paris 1897; tr. by B. Lavigne as *Anglo-Saxon Superiority: To what It Is Due*, 2nd ed. London 1899), ran through twenty-six editions. The inquiry as to the superiority of the Anglo-Saxon peoples involved a consideration of their education. As a result he published the program of a new education in 1898 (*L'éducation nouvelle*, Paris), and for its realization founded the École des Roches. He criticized the humanistic *gymnasium*, Napoleon's "high school barracks," the narrowly intellectual education through the ancient languages and a neglect of realistic and practical training, particularly in geography and history, as well as the complete absence of physical training; he showed the advantages of Anglo-Saxon education for moral character building, the genial relations of teachers and pupils working together with

freedom and sociability, and the advantages of rural education.

In *A-t-on intérêt à s'emparer du pouvoir?* (Paris 1898), his final denial of the priority of public over private life, he expressed the aloofness of the school of Le Play from parliamentary politics. He set forth a sociography, or social geography, of France in *Les français d'aujourd'hui: les types sociaux du midi et du centre* (Paris 1898), and in *Les grandes routes des peuples* (2 vols., Paris 1901-03) he expounded the significance of migrations for the social order.

DEMOLOMBE, JEAN CHARLES FLORENT (1804-87), French jurist. He taught for more than fifty years in the law school at Caen, of which he was dean from 1853 until his death. In 1851 he founded the *Revue critique de jurisprudence*.

Demolombe was an outstanding representative of the so-called school of exegesis, which dominated French jurisprudence in the nineteenth century. He did much to elaborate the doctrines of this school, which held that the meaning of a law must be sought in the texts of the law itself or even better in the intention of the legislator. With this point in view Demolombe emphasized the spirit rather than the letter of the law in his exhaustive study of the *Code civil* entitled *Cours de code Napoléon* (31 vols., Paris 1845-82). This work, which won the biennial prize of the Académie des Sciences Morales et Politiques, was never completed; it consisted of a series of treatises dealing respectively with the various sections of the code. The *Traité des biens* and the *Traité des servitudes* (vols. ix-x and xi-xii of the *Cours* respectively) are the best illustrations of Demolombe's thorough scholarship. In them the analyses of the texts are combined with constructive jurisprudence. In general, however, his method was the artificial one of presenting abstract pleadings for and against his thesis before an imaginary tribunal. Although Demolombe's methods and theories were the object of extreme adulation during his lifetime, there was a marked reaction against them after his death and his work has had little permanent influence.

DEMOSTHENES (384-322 B.C.), Athenian orator and statesman. Entering public life as an opponent of the pacifist policy of Eubulus in 354, Demosthenes found the issue on which he rose to fame and influence in uncompromising hostility to the ever widening plans of Philip II of Macedon. In 346 he acquiesced in the peace by which Philip consolidated his dominating position in Greece; but in 340 Demosthenes led Athens into a new contest for which it was unfitted in vigor, leadership and financial and military resources and he failed (partly through his own fault) to elevate the Athenian quarrel into a common Hellenic interest. After Philip's victory at Chaeronea in 338 he adopted a policy of watchful waiting, but on Alexander's death in 323 he again threw himself into the struggle of the Greeks to shake off the Macedonian yoke and paid the penalty for defeat with his life.

His political ideas and methods were the traditional ones of the great Athenian demagogues. His vision did not reach beyond the disorder of a world of autonomous city-states with Athens as a paramount power among them. But so much that was provocative of creative energy and vital for human dignity was entailed in this disorder that the man who championed it at its supreme crisis was enshrined in memory as the victim of a glorious failure. As an orator he was supreme in his own generation and to men of after times he remained, in Quintilian's phrase, *paene lex orandi*. For the many centuries of later antiquity during which rhetoric formed the substance of the higher education his style—finished, logical, detailed, animated, emotional, eloquent—was the model to be imitated and the touchstone of excellence; and the issues of his epoch were seen as he saw them. But in recent times, with increased understanding of Philip and his aims and subsidence of interest in oratory, Demosthenes has ceased to enjoy undivided admiration.

WILLIAM SCOTT FERGUSON

Consult: Schaefer, A., *Demosthenes und seine Zeit*, 3 vols. (2nd ed. Leipsic 1885-87); Beloch, K. J., *Die attische Politik seit Perikles* (Leipsic 1884); Pickard-Cambridge, A. W., *Demosthenes and the Last Days of Greek Freedom, 384-322 B.C.* (New York 1914); Adams, C. D., *Demosthenes and His Influence* (New York 1927); Blass, F. W., *Die attische Beredsamkeit*, 3 vols. DENIFLE, HEINRICH SEUSE (1844-1905), Catholic historian. Denifle was the son of an Austrian schoolmaster and entered the Dominican order at sixteen. He studied at Graz, Rome and Marseille and taught in colleges of his order in Austria and Hungary. In 1883 he became assistant to Hergenroether, then prefect of the Vatican archives. Denifle's historical works are concerned chiefly with the background of scholastic thought, mediaeval mysticism, the use of mediaeval universities and the Lutheran revolt. His *Entstehung der Universitäten des Mittelalters bis 1400* (Berlin 1885) definitely answered in the negative the question whether the universities found their origin in the cathedral schools and proved that theology was not taught as a branch of ecclesiastical learning in the early days of the universities. The success of this first work determined the French government to confide to Denifle's care the publication of the *Chartularium universitatis parisiensis* (4 vols., Paris 1889-97), which provides rich material for the social history of the times. In his *La désolation des églises, monastères, hôpitaux en France vers le milieu du XV^e siècle* (3 vols., Paris 1897-99) he pictures the destruction of churches, the ruin of monasteries, the scattering of monks and nuns and the weakening of ecclesiastical discipline, with all their cumulative effects upon the social conditions in France and Germany at the end of the Hundred Years' War. In the decline of the religious life of mediaeval Europe Denifle saw the direct causes for the religious cleavage of the sixteenth century. His *Luther und Lutherthum* (Mainz 1904; 2nd ed. by A. M. Weiss, 4 vols., 1904-06; vol. i tr. by R. Volz from 2nd ed., Somerset, O. 1917), although considered to be marked by a good deal of bitterness, revealed such amazing erudition that no work in recent times caused a greater storm among Protestant leaders, chief of whom were Harnack and Seeberg. It reopened the problem of Luther's youth and brought about considerable changes and corrections in the Weimar edition of Luther's works.

DENIKER, JOSEPH (1852-1918), French physical anthropologist and ethnologist. Deniker was born at Astrakhan and after traveling

over the Crimea, Transcaucasia and Persia he settled in Paris, where he worked in the laboratories of the Muséum d'Histoire Naturelle and the Sorbonne. In 1888 he became librarian of the museum and thenceforward his interest was definitely directed toward anthropological and ethnographical research. His popular work *Les races et les peuples de la terre* is a compendium of information on the anatomical, physiological, psychological, pathological and sociological characteristics of human groups. Despite the fact that a considerable mass of information necessary for an adequate classification of mankind is lacking Deniker attempted one. He first classified according to descriptive and morphological characters, such as types of hair and skin color, types of nose, cranium and stature. But recognizing that his arrangement according to somatic criteria was insufficient he remodeled his evidence on the twenty-nine races discussed and placed them in seventeen groups in an attempt to bring out affinities. His classifications are widely quoted, but they are regarded by anthropologists as premature. Deniker also published memoirs on the anatomy of the anthropoid apes and man, and many ethnological monographs.

EUGÈNE PITTARD

DENIS, ERNEST (1849-1921), French historian. Denis was born in Nîmes of an old Huguenot family. His participation in the Franco-Prussian War left him with a strong patriotic sense that characterized all of his later historical works. As professor at the University of Bordeaux and later at that of Paris he devoted himself to the parallel study of Germany and the Slav states of Europe. His interest in Czech history was especially profound. With Alfred Rambaud he was the originator in France of the scientific study of Slav peoples, and he is regarded by the Czechs as the man who carried on the work of their national historian Palacky.

Both by his historical work and by his personal influence he was a great factor in the creation of the Czechoslovakian state after the World War.

Denis' works were addressed to specialists and to people of broad culture alike. While always intent on pleading a cause he nevertheless aimed to be impartial and did not recoil before the enunciation of any fact discreditable to the cause he was advocating. His enthusiasm, resulting in a lively and colorful style full of striking and at times paradoxical formulae, often lends his narrative an appearance of passion; but the reader can sense the points at which, starting with a general conception more or less different from the author's, he must add correction or modification.

LOUIS EISENMANN

Important works: *Huss et la guerre des Hussites* (Paris 1878); *Fin de l'indépendance bohème*, 2 vols. (Paris 1890); *La Bohême depuis la montagne-blanche*, 2 vols. DENIS, HECTOR (1842-1913), Belgian economist, sociologist and philosopher. He was professor of ethics and political economy at the University of Brussels and for twenty years a member of the Belgian Chamber of Representatives, where he was leader of the Socialist group until his death. He was a social and economic idealist but sought an inductive, scientific basis for his views. He contributed outstanding articles on the labor movement to various liberal journals including *La liberté* and the *Rive gauche* published in Brussels and the *Revue de philosophie positive* published in Paris. He advocated a system of parliamentary sessions of labor by industry to replace existing political parliaments. Influenced by Proudhon and Auguste Comte he was a mutualist and a positivist and believed in the organic concept of society. He had no fixed social ideal, however, and regarded socialism as a stage in evolution rather than an end; he looked for a reconciliation of antagonisms through a transition from belief in a natural order and absolute right to the acceptance of relative right based on historical change and of a positive dynamic concept of economics and sociology. His most important work is *Histoire des systèmes*

économiques et socialistes (first published in Brussels 1897, later in a two-volume enlarged edition in Paris 1904-07), in which he gave an able summary of the thought of the physiocrats, Hume, Smith, Malthus, Ricardo, Sismondi, Owen and Thompson, and distinguished between static and dynamic concepts. The third volume was to have covered the socialists of the first half of the nineteenth century but was incomplete when he died. In *La dépression économique et sociale et l'histoire des prix* (2 vols., Brussels 1895) he did not seek a single cause of crises but made statistical analyses of many complex factors and considered the effects of an increase in the supply of fixed capital. In the Belgian parliament he was called upon as an expert in financial and budgetary problems. He wrote *L'impôt* (Brussels 1889), a general theory of public finance and taxation in which he showed the necessary tendency to an increase in public expenses as more and more common needs are satisfied by the state. In his *L'impôt sur le revenu* (Brussels 1881) he collected comparative data on the income tax as a basis for legislation. A number of his philosophical and sociological essays are collected in *Discours philosophiques d'Hector Denis* (ed. by G. de Greef, Paris 1919).

DENISON, GEORGE TAYLOR (1839-1925), Canadian publicist and administrator. Denison was born in Toronto and was educated at Upper Canada College and the University of Toronto.

An independent in politics, he believed in a national Canada and in the necessity of the British connection. Shortly after confederation he became one of the founders of the "Canada First" movement, which aimed to foster a vigorous national spirit and policy. He sought to keep this movement on a non-partisan basis, a policy that was justified by subsequent events. He was a leading opponent of the movement for "commercial union," or reciprocity, with the United States, which began in 1887, fearing that it was a step toward political annexation. He urged as an antidote the adoption of imperial tariff preferences and became a leading figure in successive imperialist movements, such as the Imperial Federation League and the British

Empire League, through which he worked for his fiscal ideal. He helped to win Joseph Chamberlain to this cause.

Denison was police magistrate of Toronto from 1877 to 1923, exercising extensive jurisdiction in all but the most serious criminal cases. As a magistrate he avoided precedents and technicalities and resorted to short cuts in order to accomplish essential justice. In this spirit he established at very early dates an informal children's court, which contributed to the juvenile court movement, and a woman's court.

DENNY, WILLIAM (1847-87), Scottish capitalist and wage theorist. Denny, a shipbuilder, was among the first to expound the theory, in *The Worth of Wages* (Dumbarton 1876, 2nd ed. 1877), that the value of labor, or wages, is determined by the cost of labor per unit of production. Because foreign competition was already threatening the supremacy of Great Britain's manufacturers and wages had not risen in proportion to the country's wealth, he thought it essential to increase the efficiency of labor. The policy of "the degradation of labor," reduction of output by soldiering or trade union restrictions must be replaced by free competition between workers, since competition between Great Britain's manufacturers was responsible for their success. On the basis of this analysis, the realization that his grandfather's informal system of management had become inadequate and a Presbyterian prejudice against laziness, he concluded that the old system of time wages must be superseded by payment by results, as in piece work, to stimulate workers to greater and more intelligent activity. Later, however, Denny realized that piece work if not carefully guarded is likely to reduce the effective earnings of workers.

Denny was also a pioneer welfare capitalist. He paid high wages for increased efficiency, rewarded employees for their inventions, inaugurated an elaborate system of shipyard rules, established an accident fund society to which fines for infractions of rules were given, and set up a joint committee of workers' and firm representatives to consider a variety of questions. He

feared that the growing number of absentee employers and the increasing impersonality of management were leading toward revolution, and thought that his methods, which kept his yard free from the interferences of trade unions, would avert this danger as well as benefit his employees and firm.

DENTISTRY. The first dentist probably came into existence simultaneously with the first toothache. For toothache is one of the few "diseases" which the layman has never had the slightest difficulty in diagnosing nor the least intention of enduring. Among the Egyptians dentistry was an accredited specialty of medicine; dentists commanded the same deference as priest-physicians. During the Middle Ages, however, dentistry, like surgery, fell into disrepute and was practised chiefly by barbers; and under their ministrations the only cure for toothache was tooth extraction. This deterioration in the practise of the art was accompanied by delay in the science of diagnosis. The theory formulated thousands of years before Christ that caries was caused by a worm gnawing in the tooth prevailed until 1728, when Pierre Fauchard (1678-1761), a famous French surgeon, exploded it in the first complete work on dental procedure ever published. Fauchard practised antiseptics before the word was known.

Until the middle of the nineteenth century dentistry was a craft acquired entirely through apprenticeship and as such was subject to a jealous guarding of trade secrets which Fauchard vigorously attacked. The first trained dentist to come to America was one Robert Woofendale, who arrived in 1766 and departed in 1768. Thereafter no regularly trained dentists settled here until after the Declaration of Independence. Even then they were few in number and liberally interspersed with versatile Jacks to whom the trade of dentistry was only one of many.

In 1839, however, the American talent for organization began to assert itself. The *American Journal of Dental Science* was established—the first and for some years the only periodical

of its kind in the world. The first national society of dentists, the American Society of Dental Surgeons, was organized. In 1839, too, occurred the "historic rebuff." Distrustful of their ability to rear the infant profession, dentists decided to leave it on the doorstep of medicine, in their opinion its logical guardian. Several attempts were made to have courses in dentistry included in medical school curricula. The faculty of the most important school to which the proposal was submitted replied that dentistry was not important enough to be taught in medical schools. Thereupon dental practitioners collected the abandoned infant and proceeded to rear it themselves. In 1840 they established the first dental school in the world, the Baltimore College of Dental Surgery.

For the next three decades medicine continued to hold dentistry in low esteem and it continued to struggle, somewhat unsuccessfully, against this disapproval. Twenty-five years after the Baltimore College was opened there were only four dental schools, with a total in 1865 of sixty-one graduates. Most dentists still learned their trade as apprentices to established practitioners; less than 15 percent of them were graduates of dental schools. There were no legal restrictions surrounding the practise.

In 1868, however, the legislatures of three states enacted laws defining dentistry and specifying educational requirements for license to practise it; other states soon followed. At once there sprang up great numbers of commercial dental schools and "diploma mills," frankly designed to get their students by—but not very far by—the legal requirements. By 1900, however, all states had passed laws governing dental practise, and the inevitable reaction against mediocre teaching had set in. Since then the number of dental schools has decreased. In 1926 there were forty-four dental schools in the United States and five in Canada. Commercial institutions have been automatically eliminated in the United States by the growing amount and cost of scientific equipment required. Dental education had ceased to be a profitable business and must depend at least partially on endowment.

There are nineteen schools of dentistry in Great Britain. Dental education is founded on the same preliminary education and preparation in the sciences as medicine and must be taken in a recognized medical school. Dental subjects are taught only in dental hospitals. The cur-

riculum makes dentistry a specialty of medicine and places particular emphasis on the function of dentistry in preventive medicine.

In 1900 there were slightly over 30,000 dentists in the United States—39 to each 100,000 of population; by 1928 the number had increased to 67,000—57 to each 100,000. The number of dentists in proportion to the population is larger in the United States than any other country except New Zealand. The number of dentists in proportion to each 100,000 of the population in certain other countries is as follows: New Zealand, 59; Austria, 48; Latvia, 29; Denmark, 19; Sweden, 17; Germany, 14; France, 13.9; Finland, 13; Poland, 10; Russia, 4.6; Italy, 1.7. Like doctors and nurses dentists in the United States are unevenly distributed. In some large cities the ratio between practitioners and each 100,000 of population is as high as 200, in some rural communities as low as 25.

As in the case of doctors, but to a far less extent, a constantly growing number of dentists are devoting themselves to the practise of a specialty, such as orthodontia (correction of dental alignment and of malocclusion) or dental surgery. In Philadelphia, for example, about 86 percent of the dentists are "general practitioners," 11 percent "partial specialists" and 3 percent "complete specialists."

The dental technician, to whom is delegated the preparation of oral appliances, such as bridges, plates, crowns and inlays, is comparatively a newcomer in the field. His appearance was foreshadowed, however, as early as 1768 by an advertisement of no less a person than Paul Revere, in the *Boston Gazette and County Journal*. At the present time it is estimated by the Dental Laboratory Association of Chicago that there are about 10,000 dental technicians. The dental hygienist made her début in 1914, when the first training school in this specialty graduated 27 students. Today there are over 23,000 of these practitioners, chiefly women, and the number is growing. They are licensed in twenty-five states; their work, done entirely under the supervision of dentists, is preventive rather than curative in nature.

Up to a comparatively few years ago the undertaker and dentist had one handicap in common—no one ever submitted to their ministrations until he had to. The dentist was the first medical practitioner to emphasize the value of prophylaxis. As a result of his persistent drilling, oral and verbal, Americans are now

thoroughly "mouth conscious" to an extent unknown in Europe. But although practically every one today is "sold" on the value, both to the teeth and to general health, of preventive dentistry, only 20 percent of the people actually buy it. In fact, only 38 percent receive any dental care whatever. This neglect appears to be due not to lack of intelligence but to lack of money, for dental expenditures tend to expand as incomes expand. Michael M. Davis, analyzing the expenditures of 1226 working class families, found that three fourths of the families which had only \$1200 a year spent nothing for dental care; of families with \$2500, only one fourth spent nothing.

The high cost of dental care, like that of medical service, has recently been the subject of much discussion; in both cases it is due not so much to the increased cost of any one service as to the increased expense involved in a greater consumption of a greater variety of services. To some extent too this increased cost is due to wastes in the production and distribution of dental services.

However unreasonably high dental charges may seem to patients with low incomes they must at times seem unreasonably low to dentists. The average net income of dentists in the United States in 1925, in the opinion of the editor of the *Dental Digest*, was about \$2500. A survey in 1928 by the Committee on the Costs of Medical Care showed that in Philadelphia the average annual net earnings of 205 dentists was \$5102; the median income—that of the "middle" dentist—was \$4000. Nearly a third of the practitioners received incomes between \$1500 and \$3000. In Shelby County, Indiana, a rural area, the committee found that the average annual net income was \$2744.

Although dentists are obviously unable, because of the time element involved, to do as much free work in private practise as do physicians, a great deal of dental service at little or no cost is available to the poor. Of the nearly 6000 clinics in the United States in 1926, 57 confined themselves to dental work, and many of the others, including out-patient departments of hospitals, had dental departments. Dental care approximately at cost is available to students in many universities and to workers in several industries as well as to trade unionists. Since the introduction of medical inspection of public school children, which began about 1902 in the United States (in New York City), 1906 in England and 1907 in Germany, by far the

Dentistry — Dependency

greatest proportion of treatment given has been for the correction of dental defects.

Private practise is the dominant institution in the practise of dentistry in the United States. In most European countries, however, panels of dentists under the insurance system are replacing the private practitioner. In Germany it is estimated that four fifths of all dental service is rendered under the insurance system. As in the case of medicine, dentistry in the United States is gradually becoming organized. A large amount of preventive dentistry is being practised in clinics under the auspices of philanthropic associations, health departments, industries and professional organizations. Private associations of dentists organized for profit and practising both preventive and curative dentistry have also attained considerable success. How far this trend toward group practise will continue it is impossible to say. Minority groups in both the medical and dental professions advocate that dentistry be made a specialty of medicine and that technicians be trained to do the mechanical work under the supervision and direction of these physician dentists. By this means they propose to raise the standard of dental practise and decrease the cost of dental service. This plan has met with the strenuous opposition of the organized dental profession.

DEPARCIEUX, ANTOINE (1703-68), French mathematician, physicist and mechanical engineer. He was of very humble parentage and was enabled to receive an education only by the aid of some generous persons. He earned a livelihood in Paris by manufacturing sundials, made several inventions and published books on applied mechanics and trigonometry and a logarithmic table. He was elected member of the Académie des Sciences in 1746 and belonged to many other learned societies of Europe.

His *Essai sur les probabilités de la durée de la vie humaine* (1746) was followed by the *Réponse aux objections contre l'essai* in the same year and by *Additions à l'essai* (1760). His conclusions as to the probable span of life were based on mortality tables derived from the records of certain French tontines and of births and deaths of children gathered from wide social strata and from the life records of inmates of certain monasteries and nunneries.

Deparcieux' tables attracted wide attention on the continent and in England and served as the basis for annuity calculations in France.

DEPARTMENT STORES. See RETAIL TRADE.

DEPENDENCIES. See COLONIES; IMPERIALISM.

DEPENDENCY may be defined as the state of one who receives as alms or relief from the community any of those goods and services which other members of that community receive in return for their labor or property or by virtue of their favored position in the established order.

The attitude of the rest of the community toward dependency has varied from place to place and from time to time and has by no means been confined to that feeling of superiority tinged with contempt which during the nineteenth century was so prevalent in occidental civilization that it seemed instinctive.

It is necessary to go back only to the Middle Ages to find a contrast: so long as the belief prevailed that the end of life was to serve the Lord and that He could best be served by embracing poverty, it was logically inconsistent to hold that those too helpless to live without alms were by that fact set apart as a group to be scorned. Yet, possibly inconsistently, there was some feeling that the status of the dependent was not enviable. Alms were given that the miseries of the poor might be relieved and almsgivers were exhorted to pity and commiseration. It is almost inconceivable that such attitudes toward the poor and the giving of alms should not have developed a certain sense of superiority toward them and possibly a feeling of inferiority on their side. On the whole, however, dependency was an honorable status and the resurgence of condemnation of the rich for their injustices by popular religious revivalists suggested at times that the burden of fault did not lie with the poor.

The development of a definite stigma can be found in the fifteenth and sixteenth centuries, when the support of large numbers by doles and alms began to be felt as a real burden. The very recognition that widespread dependency created a grave social problem tended to reflect adversely upon the dependents. An even more important factor was the presence among the group of large numbers of petty offenders, "valiant rogues and sturdy beggars," who were subject to police measures. The law did single out the "impotent poor" to whom in theory no blame attached and to whom it was proper to give relief. Yet in practise it was probably inevitable that there should be carried over to all who asked aid a suspicion of belonging to the group of "valiant rogues."

It remained, however, for the new religious ideas of the seventeenth and eighteenth centuries and the concomitant economic changes to destroy almost entirely any concept of dependency not resulting solely from the fault of the dependent. For as economic prosperity became the mark of the Lord's approval and poverty a sign that the victim had incurred His anger, it followed that those too poor to live without alms must be sinners in need of punishment. The economic changes which made possible the rise of many of the relatively poor to positions of affluence served to emphasize the idea of personal responsibility; the extraordinary worship of the virtues of industry, frugality and self-help likewise cast a stigma upon

the state of dependency. This attitude, registered most clearly in the English Poor Law of 1832, attempted to make conditions under which relief was given as onerous as possible for the recipient.

This view of dependency persisted long after its underlying religious sanctions had lost their vitality. New sanctions, however, were found in the theory of evolution and its current interpretation as proof of the survival of the fittest. This idea modified to some extent the emphasis on punishment in remedial action, but it did not destroy or modify the belief that dependents were a group inferior to the rest of society.

In the identification of dependency with sin or unfitness there was some exception made always for the "worthy poor," and even the strictest evolutionist recognized the possible existence of victims of circumstances. But the "worthy" seemed hard to find, and for the most part the exceptions were forgotten in the belief that in general the dependent group was less well endowed morally or physically than the independent wage earners.

The modification of this attitude, in so far as it has been modified, may be traced to a number of different sources. One was better acquaintance with those who asked aid, brought about by the rise of a professional or semi-professional group who were attempting to cure dependency by treating the dependents. This led to a greater recognition of the role played by extraneous circumstances; a realization of the continual shift in composition of the dependent groups modified the conception of dependents as a fixed and distinct part of the population. Moreover, studies of the independent wage earning group showed that many of them habitually lived in such a state of poverty that a slight setback sufficed to send them into dependency. Then, as a more critical analysis of the working of the economic system resulted in a knowledge of its wastes and maladjustments and as the growing realization of the interdependence of the individual and society led to a less complete acceptance of a rigid doctrine of individualism, the old attitudes toward economic dependency became less consistent with accepted common sense.

There was, however, no general renunciation and no conscious adoption of a new attitude. Rather the exceptions which had never been quite overlooked began to receive more emphasis. One after another certain types of dependents—children, widows, the sick and handi-

Dependency — Deportation and Expulsion of Aliens

capped, victims of industrial accidents, the aged and unemployed workers—were singled out as special groups for whom the old attitude toward dependents was no longer considered appropriate. In practise this change was registered in two ways: the provision of certain services free or at nominal costs on a universal or nearly universal basis which destroyed the taint of dependency; and the provision of special care for special groups, given only on the basis of need but with the understanding and in such a manner that persons in this group could accept help without incurring odium. At the present time the groups which have been thus marked off are so numerous and are drawn from such varied classes in the community that there would seem to be few instances in which the old attitude toward dependency could logically be held.

Yet the old attitude persists; it is registered in the very reluctance to apply the term dependent to anyone whose self-respect is to be preserved. It is often registered likewise in the treatment of these special groups, partly, no doubt, because in most places the service has not acquired a professional basis and is often administered by individuals or organizations completely out of touch with more modern concepts. It is discernible, moreover, in the practise of many whose conscious philosophy would exclude such an attitude. Probably its persistence, at least in this rudimentary form, can be expected so long as society is organized primarily for the attainment of wealth.

DEPORTATION AND EXPULSION OF ALIENS. The phrase is loosely used to mean the enforced transportation of aliens to the country of their origin. Nevertheless, the returning of aliens before they have effected an entry is properly exclusion, and deportation concerns merely the expulsion of aliens already within the country. Both are instruments for

enforcing immigration policies, but the differences arise from the fact that only the acquisition of a new residence, the other uproots the alien from his newly established environment.

From the standpoint of international law the exact status of a nation's power to exclude or expel aliens is somewhat shrouded in doubt. Despite the recognition of the fact that a nation's safety and destiny are its proper concern, there is always the conception of duties consequent upon its being part of an international community inviting commercial intercourse and being in the stream of constant transmigratory movements. Poised between such conflicting consideration lies the "right" of deportation, the boundaries of which are being empirically pricked out by national policies. As a matter of municipal law the exclusion and expulsion of aliens have historically been regarded as subject to executive control. In continental countries the power to deport has developed under the conception that it lay within the prerogative of the executive. Continental legislation upon the subject is thus meager and essentially declaratory of an incidental executive power. English practise originally assumed the possession of a similar prerogative by the crown, but since the time of the Stuarts the power has been deemed to spring from legislative grant. The same theory has dominated in the United States. The difference is important, for under the Anglo-American theory the right of the alien to continue his residence becomes a matter of law rather than of executive grace. True, law as molded by administration may actually make the difference a matter of theory rather than of practical import.

Deportation as a national policy did not originate until a comparatively recent date. Prior to modern times resort was had to the device as a temporary expedient to rid a community of individuals or groups of undesirable aliens. The early cases are of this character, the grounds for removal being political. The first English deportation statutes were also temporary measures, which from 1793 to 1826 empowered high state officials to remove under severe penalties alien propagandists of the French Revolution. Of the same character was the Alien Law of 1798 authorizing the president of the United States to remove aliens judged "dangerous to the peace and safety of the nation" or "suspected of being concerned in treasonable and secret machination." Again in

1848 England, aroused by the revolutionary movement of the continent, enacted a similar statute, never used and soon obsolete. Such legislation represents the erection of temporary bulwarks against the encroachment of revolutionary thought. Later years were to see the practise of deportation and exclusion on political grounds develop into a national policy.

Resort to deportation as a national or international policy begins in the newer countries confronted with the pressing problems arising from extensive alien immigration. The first intensification of the issue arose out of the practise of the older countries of disposing of their unfit and burdensome criminal and pauper population by transporting them to the New World. The American colonies fought this practise mainly through protest, but the records disclose actual resort to deportation by the Plymouth colony and the maintenance of a deportation policy by Virginia and other colonies. Under the federal constitution the states were stripped of their power to control immigration. They agitated volubly for relief from pauper and criminal immigrants, but for almost one hundred years Congress took no action. Apart from the Alien Law of 1798 deportation was first introduced in 1882 in response to the demand for more effective exclusion of Chinese labor. A method was introduced for the deportation of Chinese unlawfully resident within the country after determination of their rights by a judicial proceeding. The significant act, however, is the Immigration Law of 1891. Its exclusionary features were made enforceable by providing for deportation within one year after entry and by authorizing deportation within the year of aliens becoming public charges from causes antecedent to entry. An administrative procedure for deportation was created, and judicial review narrowly limited.

The significance of the act of 1891 arises from the fact that later deportation legislation has merely elaborated its mechanism, increasing the number of causes and extending the time during which deportation may take place. The act also has served as the model for the British Alien Act of 1905 and similar legislation by the British dominions. It has thus set the broad outlines of the processes for deporting aliens from the Anglo-American world.

Deportation as an instrument has two aspects. From one standpoint it is simply an auxiliary arm of the weapon of exclusion, for without deportation successful avoidance of barriers to

entrance becomes its own reward. The essential difference between deportation and exclusion, uprooting the alien as against merely debarring him, led originally to a more tender consideration of the alien resident within the country than of the alien knocking at its gates. Nations have hesitated to resort to this punitive device even after exclusion was part of a national policy. Short time limitations upon the right to deport accompany the grant of the power. But as the demand for exclusion increases and friendly regard for the alien lessens—a distinct tendency in American development—the differentiation between exclusion and deportation becomes less acute. The powers closely parallel each other; time limitations upon the right to deport lengthen and in some cases disappear; equally limited control over administrative procedure governs the one as the other. This epitomizes the trend of American legislation from 1891 onward. The list of ineligible and hence deportable aliens has grown until it includes persons likely to become public charges, convicts, feeble-minded, insane and diseased persons, contract laborers, illiterates, epileptics, prostitutes, procurers, anarchists and radicals, persons entering without inspection or in excess of the quota. Various periods of limitation govern the time during which deportation may be had, ranging from three and five years to no time limit for criminals and anarchists.

The second aspect of deportation is its use with reference to aliens originally eligible to enter the country. Aliens becoming public charges, criminals and anarchistic radicals are the chief classes so affected. The effort to shift the cost of charitable relief to the alien's country of origin accounts for making him deportable if he becomes a public charge within five years after entry for causes existing at the time of entry. Aliens deportable for criminal conduct after entry include prostitutes and procurers, persons convicted of a crime involving "moral turpitude" and second offenders. Despite the legalistic notion that deportation is not punishment for a crime its use in these cases reflects not only the desire to oust undesirable aliens but also to impose an additional penalty upon the convicted alien. A widespread belief exists that the alien preponderates in the criminal population, and deportation presents itself as an additional deterrent. Under existing laws little individualization is permitted in the deportation of alien criminals. Whatever clemency is achieved can be had only through the par-

doning powers of the executive, and although individualization is the essence of the imposition of the penalty of deportation, the use by state governors of the pardon as a means of introducing a discretionary element into the administration of the law has been severely criticized by the Department of Labor. A sense of the harshness of deportation necessarily following conviction pervades court decisions that strain to find an absence of "moral turpitude" in various crimes.

Deportation for the possession or advocacy of anarchistic beliefs begins as a matter of law in 1903, but a genuine administrative practise of seeking deportation on this ground originates only after the enlargement of the conception of anarchism and radicalism by the acts of 1917, 1918 and 1920. Like the effect of the French Revolution on England, the Russian Revolution and post-war radicalism in other countries initiated deportation as a weapon for combating the introduction of radical ideas. The provisions of the law are wide enough to include within the deportable class aliens possessing any real radical belief. Indeed, possession of the belief is unnecessary, mere ignorant membership in a radical party being sufficient. The years 1919 and 1920 saw a veritable crusade against alien radicals. Widespread raids were carried on; agents provocateurs were introduced into alien associations; thousands of aliens were arrested, detained and tried, often in flagrant violation of the most fundamental constitutional safeguards. Spectacular persecutions of this character have since been abandoned, but the ferreting out process continues. Important is the fact that the *in terrorem* application of the law denies to the alien not only that freedom and expression of belief accorded the citizen but also the freedom of action and expression regarding industrial and other conflicts that is still rightfully his.

Deportation has increased to enormous proportions in the United States. From 995 deportations for the year ending June 30, 1907, the total reached 12,908 for the year ending June 30, 1929. The complaint of the Department of Labor still centers about lack of funds to prosecute the work with more vigor and the interference of courts with administrative freedom. The full secret of the impact of deportation laws largely lies concealed in the processes of administration. The proceeding throughout is administrative, the original hearing being before an immigration inspector, with an appeal to the secretary of labor. The appeal is actually

determined by an advisory board of review and two assistant secretaries of labor, who give such consideration to the case as the handling of from 100 to 200 cases a day permits. Control over the administrative by the judiciary is narrowly circumscribed, review being limited to the determination of "jurisdictional facts," questions of law and the formal requirements of a hearing. Questions of fact, the decisive issues in the cases, are not reviewed, it being sufficient that some evidence supports the administrative conclusion. Due to the unrealistic notion that deportation is not a penalty, legislation can dispense with the constitutional safeguards applicable to the most ordinary criminal proceeding. Much the same trust is vested in the administrative in deportation proceedings in the British dominions and in England, where there is even less judicial control than in the United States. On the continent the administrative is unchecked. With whatever concern purely administrative determination of important rights be viewed, such concern will arise over the problem of deportation. As yet one awaits a thorough examination of the administration of deportation laws, for court decisions and bare legislative enactments are but peripheral to this central factor of law in action.

The problem of the country to which deportees should be returned has caused some concern. In the United States limited option is given the secretary of labor, but in special instances the alien is allowed to depart voluntarily at his own expense. Some complications have arisen from the unwillingness of nations to receive their returned subjects. Others have recently arisen from the fact that the deportee may be a political offender within his own country. Deportation may thus take the aspect of the return of political offenders, a practise antagonistic to Anglo-American traditions. Unimaginative administration of deportation laws in this respect has provoked considerable criticism, judicial and otherwise, of their tendency to provide a vehicle for the extradition of political offenders because of incidental violations of the immigration laws.

DEPRECIATION signifies a decline in value and may refer to a decrease in market prices of commodities, securities and services; to a decline

in the purchasing power of the monetary unit in which prices of other objects are expressed; or to a reduction of capital assets as they are used in the operation of a business. This discussion is concerned only with the last meaning of the term. From this limited standpoint depreciation may signify either loss in value of individual units of capital assets used in the operation of a business or the reduction, or "write down," in capital cost of such assets. The distinction arises as a question of policy, since business accounting may be intended to represent the asset values held for capital purposes, or may be really concerned with costs and their proper allocation between capital and operating account as affected by operation.

Accountants quite generally speak of the depreciation of values but for the most part are concerned strictly with costs. During periods of business stability the difference in conception has little practical significance, but during transition periods it becomes a material factor in the calculation of returns and capital standing. Whether the strict value or the cost policy is adopted, the physical units of property used for capital purposes have a limited period of use in operation and at the expiration of their service life must be retired and replaced by new units. As the service life of the capital expires, depreciation accrues and corresponding provision must be made through the operating account to replace the expired capital units. The complete concept of depreciation thus covers not only the writing down of capital assets owing to expiration of service life but also the inclusion of the accrual in the costs of operation and the preservation of the capital used in the business.

The same basic course is involved under the value and cost conception, except that the quantities may be materially different. The operations of the business are divided into conveniently comparable periods—weeks, months or years—and the ultimate purpose is to determine the amount chargeable to operation or output in relation to capital. On the cost basis, when a plant unit is installed, its full cost is viewed as a capital expenditure if it has a service life longer than a single accounting period, and as its service life expires its original cost is gradually transferred or allocated to the operating account as a part of the cost of service or output, in proportion to its decreasing usefulness in operation. This process is applicable not only to physical properties but also to intangible capital such as franchises, easements, patents and other

rights which have a limited life in a business. It does not extend to land and all so-called intangible expenditures which are incurred for permanent capital purposes.

The value and cost concepts are not always kept distinct. But even where the cost view is taken as the basis of accounting, there is still the question whether current depreciation is properly computed, under all circumstances, on the original cash cost basis or whether, when there have been price changes, recognition should not be given to higher or lower amounts than the actual cash cost of the capital units. Accountants quite generally hold to original costs and ignore the fact that when prices have changed they are making inadequate or excessive provisions for the actual replacement of the physical assets for which depreciation is accrued. Thus there is the practical question whether the depreciation allowance even on the cost basis may not be reasonably modified so as to provide for equivalent costs in relation to the changes in prices. Such modification would present the cost of operation and preserve the capital on the basis of changing equivalent costs. But few accountants favor such a departure from the cost system.

Depreciation is due to expiring life of capital assets. The most obvious cause of expired service life is physical wear and deterioration. Wear is due directly to operation, while deterioration is due mostly to weather, soil conditions or internal changes in the physical unit. There is also depletion, which represents the gradual exhaustion of natural resources, such as forests, coal, all kinds of ores, natural gas and oil.

Besides such physical factors there are also functional causes, including obsolescence, inadequacy and changes in consumers' demand. Obsolescence is caused by technological improvements. Under competitive conditions plant and equipment units are ruthlessly scrapped whenever cheaper output can be obtained through more efficient apparatus, and in many industries obsolescence is the most important cause of depreciation. Inadequacy develops as the existing appliances and structures gradually become incapable of meeting the growing requirements demanded of them. Likewise a change in demand as to kind or quality of service often causes retirement of capital assets which otherwise might be continued in use indefinitely. In all three classes the retirement is due to the fact that the old capital units perform their functions less economically or appropriately than the new units.

There is also obsolescence of wider range which involves an entire industry, as in the case of street railway transportation systems which according to present indications appear antiquated and may be superseded by bus operation. This is known as system obsolescence and requires complete capital amortization and transfer to other forms of investment without replacement by similar kinds of property.

The depreciation process has been generally accepted by accountants and financial analysts as essential to sound financial management. In recent years, however, its validity has been challenged by certain writers who contend that it properly applies only to isolated property units, each considered as an independent object of value. When large numbers and great varieties of such units are combined in a single business, their individual character disappears and they must be considered in their collective aspect. When, for example, a railroad or an electric corporation or any business with a large and varied property is thus considered as a whole, it is contended that the idea of depreciation no longer applies; since, although individual units are continuously retired and replaced, the property in its entirety remains unimpaired as to productive capacity and earning power. Therefore, it is claimed, there is no depreciation, provided that retirement and renewals are made, that the cost is included in the operating account and that the property is kept in first class operating condition.

This view is predicated upon the concept of aggregate business value and not upon cost or value of individual asset units. If, however, the object of accounting is to determine cost of operation and to keep a record of investment, then the depreciation theory applies, for the renewal method would result in erroneous or inadequate presentation of the facts. When a plant has reached stable conditions, so that annual retirements and renewals have been substantially equalized, then the renewal method would produce the same results as the depreciation process with regard to charges to operating account but not with respect to the showing of capital investment. But if a business is expanding or if there are material changes in conditions, then the renewal method gives different results both as to operating costs and capital account. Accountants and economists generally look upon the depreciation method as the more desirable.

There are three general methods of determining the amount of periodical depreciation: the

straight line, the ascending line and the descending line. All start with the actual cost of the capital units and then estimate service life and salvage. For convenience the computations are usually made on an annual basis, subject to subdivisions by month or any other desired period. If the straight line method is used, the original cost of a capital unit, less salvage, is divided by the number of years of expected life, and then an equal annual charge is made to the operating account. As an inseparable part of the process an equal annual provision is made for the preservation of capital investment.

The ascending line method represents increasing annual charges to the operating account and gradually increasing provisions for the preservation of capital. It usually appears as the so-called sinking fund system: the same sum is set aside annually which together with compound interest will create a fund equal to the original capital sum, less salvage, at the expiration of the service life of the capital unit. While the basic annual allowance follows a straight line, the sinking fund accruals produce an ascending line, so that the net annual provisions increase from year to year with the growth of the sinking fund. The ascending line methods, however, can be adopted without regard to sinking fund operations by scheduling a rising series of depreciation accruals and carrying them systematically through the operating and capital accounts.

The descending line is less commonly used than the straight line or ascending line methods. When it is used it is usually taken as a fixed annual percentage based upon the net balance of capital investment in the asset units. It is generally used when only net capital balances are carried in the property accounts without separate depreciation reserve, while ordinarily the property accounts continue the full original cost of the capital units until actual retirement and the past accrued depreciation is cumulatively shown in a special reserve account.

There is no conclusive basis of determination as to the relative advantages or financial soundness of the three methods. So far as general convenience is concerned, the straight line method is the simplest and most commonly used. The ascending line corresponds more closely with the changes in the separate value of individual units when determined with respect to discounted earning capacity. The descending line method, however, probably corresponds more closely with the actual sales value of individual capital units. The heaviest depreciation, so far as

marketability of used equipment is concerned, probably comes in the earlier years of most capital assets.

Any specific method is best applied to groups of like assets instead of individual units, since estimated life involves average expectation rather than a fixed period for each unit. If the straight line method is used, an average annual percentage may be established for the business as a whole, based upon consideration of the various groups of units, their relative capital cost and expected life, and may then be applied to the aggregate capital cost of the depreciable plant. Such a rate furnishes the most convenient course but requires reexamination from time to time with respect to all the elements, especially the expected life calculated for each group of units.

The depreciation provisions are sometimes based upon special surveys and are irregular as to annual amounts. They may be adjusted to financial ability—increased with high earnings and reduced with low earnings. They may also be correlated with service performance or output—a definite allowance, for example, may be made per car mile, per kilowatt hour generated, etc. Such methods do not deal with definite capital cost and expected life. While they may produce substantially the same results they are less subject to exact determination and are more likely to lead to unsound practise.

The formal accounting arrangements depend upon the specific objectives of the business. Usually the accounting system provides for the recording of the original cost of each unit under its appropriate property account; new units are debited at cost, retired units are credited at their original cost, and the balance of the account shows the original cost of all units kept in service. As time passes the periodical depreciation is charged to operating account and is simultaneously credited to a special depreciation reserve. While the operating account is cleared at the close of each period, the depreciation reserve continues the cumulative depreciation accruals and at the end of the expected life usually contains a sum equal to the original capital cost of the units as shown in the property accounts, less salvage. Upon retirement of the units the original cost is credited to, i.e. deducted from, the property account and at the same time is debited to, or deducted from, the depreciation reserve. Under this scheme, which covers all capital units, the total balance of all property accounts at any time shows the original

cost of all property units left in operation, while the balance of the depreciation reserve represents the cumulative amount of such original costs charged to past operation. This scheme thus provides a complete cost record of property in use at the same time that it shows the extent of the accrued depreciation.

There is often confusion between the terms depreciation reserve and depreciation fund. The reserve is merely an offsetting account to preserve the record of depreciation accruals, as distinct from the capital cost of existing properties. As charges to operating account are made, equivalent funds are automatically locked up within the business through the reduced showing of net operating return. The funds thus retained are ordinarily used for any business purpose without separate designation. While they are intended for renewals they may be properly regarded as general capital replacements without regard to specific unit retirement, to be used freely for the purchase or construction of any property needed for operation. They replace in an equivalent cost sense the depreciation as accrued and charged to operation, so that the specific renewals have no accounting distinction from additions to capital assets. When, however, a property is not expanding or when it contains some large individual units or when there are legal restrictions, separate investment of the depreciation funds may be desirable or necessary to effect specific renewals. In such instances, as the depreciation charges are made to operating account and credits are entered in the depreciation reserve, there is a simultaneous transfer of cash or equivalent assets to a special depreciation fund, which is separately invested and accounted for. If completely maintained the amount of the fund, as an asset, is equal to the depreciation reserve. The latter constitutes the deduction for depreciation from the original costs in the property accounts, while the depreciation fund contains the assets accumulated to replace the accrued depreciation. The fund as well as the reserve may be variously subdivided as desired for business purposes.

Where large properties are involved, especially when they are scattered over wide areas and are of great variety, systematic provisions for depreciation require practically a continuous inventory of capital units. Usually the system provides for groupings so as to include in the same schedule all property of the same kind or function located in the same territory or plant, showing readily the number of units, the original

cost, the date of installation, the expected life and the amount of depreciation applicable to each operating period.

The depreciation process is primarily a matter of private concern to each business. But it has also far reaching public significance, whose extent depends upon the character of the business and its ramifications in the modern economic structure.

The first fact of public significance is the general dependence of our economic organization upon private capital and management. The public interest therefore requires sound financial policies on the part of the various private groups. While they are private in form, in their collective significance they are public. In a socialistic economic order the depreciation process would be the direct concern of the public management of industry. From a somewhat different standpoint there are also the interests of various classes of investors, who constitute large social groups. The relationship of a large modern corporation to its stockholders as well as to its bondholders and other creditors is really a fiduciary one, so that relative rights and obligations are involved, including not only large numbers of persons but also savings banks, insurance companies and other semipublic investment institutions. Management today is largely independent of the generality of stockholders, except special groups. Hence it is important that sound financial policies be adopted and carried out, that costs be accurately shown and capital not impaired.

Depreciation acquires additional significance in the industries which furnish recognized public services and are therefore subject to special public control with respect to service, rates and financial structure. For such industries there is additional reason for systematic cost provisions with respect to service and investment, and under present conditions they raise special questions as to valuation for rate making and other public utility purposes. Whenever public considerations are involved in the conduct of private business, proper depreciation provisions are essential to determine costs and to prevent capital dissipation.

The emergence of the income tax as an important source of revenue in advanced countries and the consequent need for a clear concept of income lend particular importance to the problem of depreciation. The agencies of financial administration and the courts have laid down many rules and regulations in an attempt to

ascertain the proper amount and rate of depreciation for various types of capital assets.

DEPRETIS, AGOSTINO (1813-87), Italian statesman. Depretis took part in the movements of 1848-49 and 1859-60 for Italian unification and, following Garibaldi's occupation, was vice dictator of Sicily. In the parliament of the new Italian kingdom he led the party of the Left which in 1876 wrested control from the rigidly conservative Right. Such was the impetus and force of the Left in this action that it appeared to be conducting a revolution in legal form. Ardent liberal hopes were aroused, but the Left proved little less conservative than its predecessor. During the eight administrations over which Depretis presided from 1878 to 1887 with brief interruptions, nothing new occurred except the adoption of a compulsory education law in 1877, the grant of the suffrage in 1882 to lower middle class elements and the passage of a few such welfare measures as the repeal of the unpopular grist tax. Depretis continued the work of juridical and administrative unification begun by the Right. His routine administration was accompanied by a process of gradual and subtle degradation of political practises, given the specious label "transformism." Depretis' transformism was an effort to abolish distinctions of party and to obtain the support of the Right. Both parties were induced to abandon traditional views for the sake of wielding power. As a consequence party divisions disappeared, parliamentary institutions were corrupted and Depretis and his group wielded practically dictatorial powers. Such opposition as arose on the extreme Left from labor elements newly touched by socialist doctrines was ruthlessly suppressed; in 1886 Depretis broke up the Independent Workers' party. As Croce has shown, Depretis merely accelerated a process already far advanced as a result of Right-Left struggles for power and the dissolution of the basis for the ideals of the first decades of unification and national solidarity.

DE QUINCEY, THOMAS (1785-1859), English writer. The author who took an almost Baudelairean delight in flaunting his passion for opium in the face of the British public and whose superb "impassioned prose" broke all bounds of literary convention had in him little of the political or social rebel. Through his innumerable contributions to the periodical literature of his day there breathes a profound reverence for established English tradition; he was a Tory of ancient lineage, a devout Anglican rejoicing in his membership in a "pure, holy and magnificent church." That in spite of these predisposing allegiances he could advance in his two chief political papers, *A Tory's Account of Toryism, Whiggism and Radicalism* (1835-36) and *On the Political Parties of Modern England* (written in 1837), a thoroughly scientific doctrine based on a genetic view of British parties—according to which Toryism and Whiggism were necessary opposing forces, each performing a specific function determined by its historical origin and together "sustaining the British constitution in its integrity by their equilibrium"—illustrates his capacity for philosophical detachment and largeness of view. De Quincey possessed an intellectual audacity which in one interval of freedom from opium extended to a projected *De emendatione humani intellectus* and in another to an advertised *Prolegomena to All Future Systems of Political Economy*, but which in reality dissipated itself in subtle expositions of miscellaneous literary, historical, philosophical and often curious subjects or in commentaries upon the works of other speculators. By translation and criticism De Quincey did more than anyone else except Coleridge in the period before Carlyle to introduce German philosophy and romanticism—particularly the writings of Kant—into England. De Quincey's power of lucid exposition and of felicitous illustration also enriched economic literature; and although they present no original contribution and treat only a very few points, his writings in this field won the admiration of J. S. Mill, who quotes him freely in his *Political Economy* (bk. iii, chs. i-iii). The disgust which De Quincey recorded in 1811 when he declared that he had looked into "loads of books and pamphlets on many branches of Economy" and

had found most of them "the very dregs and rinsings of the human intellect" bore no resemblance to the revolt of a Coleridge or a Ruskin against the dismal science. Until 1811 economics had merely failed to justify itself to De Quincey's mind, and when in 1818, after a period of mental prostration, he chanced upon Ricardo's *Principles*, he became as enthusiastic as he had previously been critical. In 1823 he published in the *London Magazine* an article demonstrating the fallacy in the Malthusian theory of population. This was followed the next year by a discussion of Ricardo's doctrines in *Dialogues of Three Templars*. His principal economic work was *The Logic of Political Economy* (Edinburgh 1844, new ed. Boston 1859), rearranged from a series of papers published in *Blackwood's Magazine* in 1842 under the title "Ricardo Made Easy." Most of this was devoted to a discussion of the relative influence of utility and scarcity, the former being described as affirmative or power value, the latter as negative or resistance value. De Quincey here approached but failed to hit upon the conception of marginal utility which had been explained by Lloyd a decade earlier. In a final paper on "California and the Gold-Digging Mania" (1852) he applied the law of rent to gold mines and pointed out that the proportionate increase in cost would set a limit to the depreciation of gold.

DERAISMES, MARIA (1828-94), French feminist. Maria Deraismes, well educated and of a wealthy family, was an outstanding figure in the French woman's rights movement of the second half of the nineteenth century. At a period when few women dared to speak in public she contributed powerfully to the development of feminist ideas by lectures, given especially from 1868 to 1870, devoted to the study of the condition of woman, who, she said, was trained to prejudice by being robbed of her reason. Before this she had written plays. Always

fearlessly active she headed an ambulance unit in the Franco-Prussian War. In 1872 she engaged in a polemic with Alexandre Dumas fils, who declared that woman must necessarily hold a place subordinate to man. Her pamphlet *Five contre Monsieur Dumas fils* (Paris 1872) made a sensation. In collaboration with Léon Richer she directed the French League for Woman's Rights, organized in 1876, which later became the Woman's Welfare Society. They also organized the first International Woman's Rights Congress, which was held at Paris in 1878 and was attended by delegates from America, England, Italy and Switzerland. An ardent free-thinker, Maria Deraismes presided over the first anticlerical congress in 1881, and the next year she was admitted to Freemasonry, then strongly anticlerical. In 1893 she founded the first mixed Masonic lodge, of which she was "Venerable" until her death the following year. Her complete works were published in 1895 (1 vol., Paris).

SUZANNE GRINBERG

DERBY, EARL OF, EDWARD HENRY STANLEY (1826-93), British statesman and social reformer. Derby's tendencies in the direction of social radicalism were somewhat tempered by the aristocratic traditions of his family, one of the oldest in England. He entered the House of Commons in 1848 and soon aligned himself with the more progressive elements in the Conservative party represented by his friend and colleague Disraeli. Manifesting from the outset an independent spirit he voted for important liberal measures, such as the removal of Jewish and nonconformist disabilities, the abolition of purchase in the army and amendments to the law relating to married women's property. Under his father, the fourteenth earl, who was three times prime minister (1852, 1858 and 1866-68), Derby came to occupy an increasingly influential position in the conduct of colonial and foreign affairs, pursuing a consistent policy of avoiding any action that might involve England in a European war. In the Beaconsfield ministry of 1874 he served as secretary for foreign affairs until 1878, when he resigned because of his opposition to the prime minister's aggressive foreign policy. He joined the Liberals but during the first two years of Gladstone's second ministry refused office in order to be able to take a

more active part in various social and non-party movements, such as sanitary reform, regulation of mines, acquisition of people's parks, improvement of technical education and the spread of cooperative societies. His address before the thirteenth annual congress of the cooperative societies in 1881 reveals him as unique among the statesmen of the day in his sympathetic understanding of the methods and principles of that great movement. "The subject of cooperation, is in my opinion," he said, "more important as regards the future of England than nine-tenths of those discussed in Parliament and around which controversy gathers." This statement, abundantly vindicated by the subsequent growth of the movement, expresses the true sympathies of a man who at one time gave promise of becoming prime minister but who because of his inability to ally himself permanently with either of the great parties was forced to sacrifice a great career.

F. J. SHAW

Consult: Derby, E. H. S., *Speeches and Addresses*, ed. by T. H. Sanderson and E. S. Roscoe, 2 vols. (London 1894), especially biographical sketch by W. E. H. Lecky, p. xi-xliv; Monypenny, W. F., and Buckle, G. E., *Life of Disraeli*, 2 vols. (new ed. London 1929); Morley, J., *Life of William Ewart Gladstone*, 3 vols. (London 1903) vols. ii-iii.

DERNBURG, HEINRICH (1829-1907), German jurist. He studied law at the University of Giessen and became *Privatdozent* at Heidelberg in 1851. He subsequently lectured at Zurich and Halle. In 1872 he was appointed professor of Roman and Prussian law at the University of Berlin, where he remained until his death. His early lectures and research were devoted to Roman law. In this field his outstanding work was *Das Pfandrecht* (2 vols., Leipsic 1860-64), a treatise on pledge, developed from the principles of modern Roman law. In his work entitled *Pandekten* (3 vols., Berlin 1884-87; 8th ed. abridged by P. Sokolowski, 1911-12) he discussed the Pandects historically but took little notice of the newer investigations concerning the interpolations in the Digests of Justinian.

In the meantime he had decided that Prussian law students needed in addition to a knowledge of the Roman law an introduction into the civil law of their own country. Accordingly he lectured on Prussian law and in 1871 began the publication of the *Lehrbuch des preussischen Privatrechts* (3 vols., Halle 1871-80; vol. iii 4th ed., vols. i-ii 5th ed. 1894-97), a classic work

on Prussian private law. In it he compared the common and civil law and brilliantly demonstrated the interaction of law with economic and social life, particularly in connection with the common law. He rounded out his work on German private law with *Das bürgerliche Recht des deutschen Reichs und Preussens* (5 vols., Halle 1898-1905; 4th ed. 1906-15), written after the completion of the German civil code. He was also the author of *Das Vormundschaftsrecht der preussischen Monarchie* (Berlin 1875, 3rd ed. 1886) and, in association with other scholars, *Hypothekenrecht* (8 vols., Leipsic 1877-91), two important treatises dealing respectively with the German law of guardianship and with mortgages in Prussian law.

DEROIN, JEANNE (1805-94), French feminist and socialist. After the Revolution of 1848 she devoted herself to the cause of feminine equality. She contributed to the short lived *Voix des femmes* (March-June 1848), edited by Eugénie Niboyet, and with Desirée Gay founded its successor, *Opinion des femmes*. In 1849, the year of the first republican election, she stood as candidate for the National Assembly to protest against the omission of women from "universal" suffrage. This bold action gave rise to a vigorous polemic with Proudhon. As a good housewife, claimed Jeanne Deroin, the woman has a right to citizenship; the state, that badly administered household, needs her good management.

Jeanne Deroin also was active in the socialist movement. In *Opinion des femmes* she proposed a union of fraternal associations—a step fatal to the paper. This union was to aim at supplanting capitalist society peacefully by issuing paper notes as a medium of exchange and by organizing mutual credit between its federated associations. More than one hundred associations had joined the union when Madame Deroin and her associates were arrested in 1850 on the charge of forming a secret society with a political aim; she was condemned to six months' imprisonment.

After the coup d'état of 1852 she emigrated to England to avoid arrest for having helped proscribed republicans to escape. There she continued for two years to publish *Almanachs des femmes*, a yearbook she founded in France in

1852 to further her feminist propaganda. In her exile, however, her general activities declined. She died in London in 1894.

DÉROULÈDE, PAUL (1846–1914), French poet and political agitator. Déroulède served in the French army during the Franco-Prussian war but a subsequent equestrian accident prevented him from continuing his military career. He became instead the poet of the *revanche* and the apostle of modern French nationalism. His personal fortune, his poetic gifts and his physical strength were all spent for the single purpose of providing a moral basis for military revenge against Germany. Through his patriotic ballads he did more than any other individual to keep alive the desire and the hope for the recovery of Alsace-Lorraine. His *Chants du soldat* (Paris 1872), crowned by the Academy, declaimed at the Comédie Française, memorized by school children and sung in the streets, went through more than one hundred editions. In 1882 Déroulède with Félix Faure, Henri Martin and other nationalist intellectuals founded the Ligue des Patriotes in order to arouse the spirit of *revanche* and defend morality, religion, the family and the nation. In 1914 the Ligue claimed to have a membership of 200,000 and it is still an active agent in the propagation of a chauvinistic and militant nationalism.

Déroulède as self-constituted forger of French alliances traveled throughout Europe and was one of the most active propagandists of the Franco-Russian alliance. He was a supporter of Boulanger, an *antidreyfusiste* and an avowed enemy of the parliamentary system. His legislative career in the Chamber of Deputies was thus confined to oral disturbances. In 1900 he was sentenced to ten years of exile for complicity with the royalists. Pardon was offered to him but he refused to return to France until the passage of the amnesty law of 1905.

DE SANCTIS, FRANCESCO (1818–83), Italian man of letters, educator and statesman. A native of Morra Irpino, de Sanctis went to Naples and founded a private school in which he began his teaching of literature. For participating in the liberal movement of 1848 he suffered a three years' imprisonment after the Bourbon reaction and upon his release was sent into exile. He taught at Turin and then at Zurich from 1856 until the establishment of the kingdom of Italy, when he became minister of public instruction in Cavour's first cabinet. Henceforth he divided his time among teaching, writing, journalism and politics. De Sanctis' supreme achievement was the revival of literary criticism in Italy through his teaching and writings, especially his classical *Storia della letteratura italiana* (2 vols., Naples 1870; new ed. by Benedetto Croce, Bari 1912) and his *Saggi critici* (Naples 1866; new ed. by Paolo Arcari, 3 vols., Milan 1921). The influence of his aesthetic theory and of his broad conception of the significance of criticism was particularly marked at the University of Naples, where he was professor of comparative literature from 1871 to 1877.

De Sanctis also occupies a position of some importance in the history of Italian political thought. He was a liberal who struggled against the clericals and who, when he found the historic Right becoming solidified in a narrow conservatism, abandoned it for the progressive Left. But in contrast to the merely negative and formal doctrine of the advocates of laissez faire his liberalism envisaged a freedom "which is self-limited, has a program and aims to attain definite ends and social objectives"; it thus bears some analogy to the doctrine later developed by T. H. Green. While he desired to see the benefits of liberty extended to the masses he realized, as he wrote in 1877, that "democracies, impatient and violent . . . in the long run become corrupt and impotent, retarding and impeding the progress which they seek with so much haste . . .," and that "what is known as Caesarism does not necessarily occur only in monarchies but also in constitutional states when power falls into the hands of a turbulent and inexperienced people." To his mind the only avenue of escape lay in educating the masses according to a broad cultural program which would direct the intellect to highly concrete and specialized ends and would make it an instrument for illuminating and guiding action. These views de Sanctis had an opportunity to expound at length during his last two terms as minister of public instruction,

in 1878 and from 1879 to 1880, as well as in his plan of civil education for Italian youth based upon his conception of liberty and self-discipline. Although he was essentially a scholar he was one of the foremost Italian advocates of physical training for the young; such training he regarded not as an end in itself but as a means of spiritual and moral discipline. His attitude toward mass education cannot be understood except in the light of the "anti-intellectualist" fiber of his mind; this was compactly expressed in his famous address of 1872, *La scienza e la vita* (Naples 1872; tr. by Edith Wright, Philadelphia 1884), in which he set forth the view that science to be creative, that is, to be translated into action, must necessarily build upon a groundwork of vital moral forces.

London 1922) pt. ii, ch. xv; Russo, L., *Francesco de Sanctis e la cultura napoletana (1860-1885)* (Venice 1928); Villari, Pasquale, *Studies, Historical and Critical*, tr. from Italian by Linda Villari (London 1907) p. 157-99.

DESCARTES, RENÉ (1596-1650), French philosopher and scientist. Descartes was the son of a parliamentary counselor and was educated for the career of a gentleman by the Jesuits at La Flèche. After serving in the Dutch, German and for a short time in the French armies his studious inclinations triumphed and in 1628 he retired to Holland to devote the rest of his life to scientific research and philosophic reflection. His first book, *Essais philosophiques* (Leyden 1637), contained his famous "Discourse on Method," an essay on dioptrics, one on meteors and a sketch of his epoch making analytic or algebraic geometry. Then followed his *Meditationes de prima philosophia* (Paris 1641), his *Principia philosophia* (Amsterdam 1644), which expounded his physical doctrines, and last *Les passions de l'âme* (Paris 1649), which developed his biologic and psychologic theories.

Descartes impressed his own generation and the one immediately following by the bold novelty of his physical speculations. His vortex theory became fashionable in the salons, but to the progress of scientific physics he contributed relatively little except through his mathematical method. His mechanistic biology, viewing animal motion from its purely physical cause, influenced the progress of medicine and prepared the way for the materialism of the eighteenth century. In his ethics and psychology

he stressed the physiologic basis of human passion, holding, however, that desires can be controlled by controlling their physical expression. Felicity and good will are thus to be attained by rational activity free from the disturbances of passion. In this he showed the influence of the stoics.

While Descartes made almost no direct contribution to the strictly social sciences he must still be reckoned, through the boldness of his rationalistic method, as one of the great figures in their history. His rejection of final causes meant that the study of social phenomena was to focus on their necessary connections and the mechanism by which they are actually brought into being; and this can be achieved only by close and precise observation and rigorous logical or mathematical calculation. The influence of Descartes' mathematical method was thus opposed to traditionalism and to the purely historical approach. His was the spirit of free enterprise which regards new houses or new towns rationally planned as superior to those which have grown up through the accretions of time. In this too he prepared the way for the rationalism of the eighteenth century revolutionary philosophers.

Descartes' influence was first felt most extensively in Holland, where it was expounded by Renieri, Regius, Geulincx and Spinoza. Cartesianism spread rapidly also in France. It was taken up by idealistic and religious philosophers like Malebranche as well as by physicists like Rohault. The Jansenists were mildly favorable to it, and the jurists Domat and Daguesseau reflected its rationalistic influence.

Formerly it was a commonplace to regard Descartes as the founder of modern philosophy and as the source of the idealism of Berkeley and Kant (through Malebranche, Molyneux and Collier). Recent study places greater emphasis on the continuity of the neo-Platonic tradition and on Descartes' own obligations to the scholastic philosophy. A copy of St. Thomas' *Summa* was one of the few books that he carried with him. Nevertheless, Descartes stands out in the history of human thought as one of the founders of scientific philosophy and of the rationalistic faith that in dealing with human affairs we should seek the greatest attainable clarity of understanding. His conception of the reign of law weakened the attitude of looking for supernatural or miraculous interventions in history. He thus wrought for the secular liberalism which sees no reason why religious opin-

ions or differences should bar anyone from participation in public life and work.

His writings were placed on the Index in 1663.

DESMOULINS, CAMILLE (1760-94), French revolutionary agitator and journalist. Desmoulins was born in Picardy of a good, but not wealthy, family of lawyers and civil servants and was educated as a scholar at the Collège Louis-le-Grand at Paris. Here as elsewhere in France the rigid classical curriculum was easily adapted to the spirit of the age, and young Camille learned republican virtue from Livy and Plutarch. The Roman trappings of which he was so fond hardly disguise the true modernity of his role in the revolution. For, in spite of the accounts he himself has given of how his table top oratory stirred the Palais Royal to attack the Bastille and in spite of his election to the Convention as a follower of Danton, his real importance lies in his work as a journalist. Desmoulins is one of the founders of a kind of

journalism very important outside of Anglo-Saxon countries—the personal, witty, often unprincipled journalism of comment, not of news. In two pamphlets, *La France libre* (Paris 1789) and the *Discours de la lanterne aux parisiens* (Paris 1789, new ed. 1869), he caught the popular taste for violence set off by wit and literary ability. This style he maintained, a bit less feverishly, in his weekly newspaper, *Les révolutions de France et de Brabant* (7 vols., November, 1789-July, 1791). Danton made use of him to attack Brissot, and the resulting pamphlet, *Jean Pierre Brissot démasqué* (n.p., n.d. [1792]), as well as the later *Histoire des brissotins* (Paris 1793, English translation London 1794) inspired by Robespierre, were conspicuously bitter, violent, unfair and clever in an age when only the latter quality is rare. Desmoulins's last venture into journalism was *Le vieux cordelier* (December, 1793-April, 1794), undertaken to promote Danton's campaign to end the Terror. This brought him the guillotine and a secure place in French literature.

DESPINE, PROSPER (1812-92), French psychiatrist and criminologist. He devoted most of his life to studies in medical philosophy and criminal psychology. Like many of his French and English contemporaries he concluded from his clinical researches that serious crimes were due to "moral insensibility" or "moral idiocy" caused by inherited organic brain defects. He held that society has a right to defend itself against such criminals, who are characterized by lack of pity, prudence and foresight and although frequently of considerable intelligence are morally irresponsible for their acts. Criminals socially accountable for their behavior must be subjected to reformatory treatment based on a study of their characteristics. Treatment should be continued through the use of an indeterminate sentence until the criminal shows moral improvement. Despine had no great hope that the

treatment would result in anything more than legal conformity, which might be attained if a trained staff, working in an institution small enough to permit intimate contact with the prisoners, exploited in every way the sentiments of pride and self-esteem present in all men, however degraded.

DESTUTT DE TRACY, ANTOINE LOUIS CLAUDE (1754-1836), French philosopher. In his youth Destutt de Tracy was a cultured dilettante, a distinguished cavalry leader and skilled in the art of dancing. Under the stimulus of the French Revolution he devoted himself to an intensive pursuit of knowledge along many lines and to the formulation of a methodology which he came to regard as not only superior to the best efforts of the past but virtually infallible. In his somewhat disillusioned old age, robbed of his stimulating association with Cabanis and Daunou, he abandoned half completed the task he had originally set himself of establishing upon the fixed foundation of this new methodology the political, moral and physical sciences.

Starting with the sensationalist assumptions inherited from Locke through Condillac, Destutt de Tracy evolved a philosophical system which he believed to afford for the first time a true analysis of the processes of the human mind in the formation of ideas. The recognition of truth and the detection of error could be reduced to a science as accurate as the physical sciences because similarly based on direct observation. This science of ideas he christened ideology and in the light of its basic truths set out to examine the "first principles" of all other branches of knowledge. He drew up a course of public instruction designed to conform more closely to the true progression of learning; and although his attempts at practical reform were frustrated by Napoleon's measures against the *idéologues*, he revealed in the first section of his *Éléments d'idéologie* the extent to which prevailing educational methods were antiquated. In the uncompleted second section of this work he proceeded

to apply the principles of ideology to a reexamination of the political and moral sciences. From sensation comes perception, from perception desire and from desire needs. Liberty is the freedom to gratify those needs, labor the means of gratifying them. The system of political economy which he constructed upon this foundation evoked a brief word of approval from Ricardo and aroused the interest of Thomas Jefferson, who sponsored an American translation (*A Treatise on Political Economy*, Georgetown, D. C. 1817). Destutt de Tracy's political philosophy, which is formulated most clearly in his *Commentaire sur l'esprit des lois de Montesquieu*, was to a certain extent influential in shifting the emphasis of eighteenth century liberalism, especially in its conception of natural rights. Opposed to the rationalistic and metaphysical approach with its assumption of absolute natural rights, he was forced in his defense of liberty to confine himself to a concern for the individual as an isolated phenomenon with needs differing from those of his neighbor. An ideal government was a government, however tyrannical according to abstract concepts of liberty, which satisfied the needs of a people at a particular time. The national will, which was the only power in the state, must remain a unit, and Montesquieu for all his wisdom in understanding the relativity of institutions and laws had seriously erred in proposing that it be divided. Invoking Rousseau, Destutt de Tracy discounted the degree of liberty enjoyed under the English constitution and compared it unfavorably with conditions in the United States. Such a thesis could not fail to appeal to Jefferson, who persuaded his old friend to allow him to translate the work into English.

DETECTIVE AGENCIES, PRIVATE. Private detective agencies offer for sale services in crime detection, crime prevention and industrial spying. Of the thousands of such agencies in the United States there are many which

do a very profitable business. Their advertised services are similar in some respects to those of the official police: shadowing individuals; obtaining evidence to support legal action; conducting investigations to identify and apprehend kidnapers, thieves and blackmailers; and to uncover frauds. Private detectives are hired by the rich to guard their estates or other property and by banks, hotels, business houses and theaters to prevent thefts on their premises. Finally, they are used by industrial establishments to spy on the labor force and to undermine unions and other labor organizations.

Although competing with public officers these agencies in order to gain prestige frequently claim close relations with the government and use names, badges, uniforms and other paraphernalia easily confused with that of official bureaus. Private agencies have through such misrepresentations extorted money from bootleggers by holding the threat of a raid over the victims' heads, terrorized and mulcted foreigners and impressed on the public a belief, out of all relation to the facts, in their ability to protect persons or property.

Private detective agencies are often used by political groups to discredit rivals. Conservative business interests backing one political party in 1924 paid a private detective \$50,000 to secure evidence that would connect their progressive rival for the presidency, Senator Robert La Follette, with extreme radicals. In 1930 a candidate for the United States Senate hired detectives to trail a progressive senator who was officially investigating the former's campaign expenses.

Most agencies advertise service in domestic troubles and it is common practise in divorce cases for an agency to be hired by one of the parties or by both in collusion to secure the evidence necessary to procure divorce. Private detectives have lured persons to commit illegal acts in order to obtain such evidence. The testimony of private detectives is usually accepted in the courts, although some corroborative evidence is ordinarily required.

The investigation of juries is a regular service of detective agencies. The line between investigation and tampering has been crossed in many cases. In the trial of a wealthy oil magnate in 1929 a leading agency was found to have approached jurymen and offered bribes for favorable votes. Its agents were found guilty of contempt of court for plotting to obstruct justice. The head of this agency, a former high

federal official, had earlier been found guilty of such illegal acts as telephone wire tapping and of entering offices secretly to copy and remove private business papers.

Detective agencies are often employed illegally to obtain the business secrets of rival concerns, and many suits have resulted from this practise. Agencies have also in some cases secured contracts for work through blackmail, threats and intimidation or when faced with dismissal have held their jobs by threats of exposing certain secrets to the public or to competing firms.

It is in the field of industrial relations that the private detective agencies have become most conspicuous, and here they have had their greatest effect on social conditions. Since the days of the Knights of Labor they have practised espionage on labor, and some agencies have specialized in this type of detective work. When engaged in this type of spying some agencies drop the word detective from their titles, calling themselves industrial service bureaus, corporations auxiliaries, audit, inspection and efficiency companies and personnel relations counselors. Their functions remain practically unchanged. They offer to help employers solve their labor problems, a service which usually consists of sending undercover men, "emis-saries," "inside operatives," disguised as workers, into the clients' plants to ascertain and report on how the labor force is reacting to its work and to union organization. Or investigators may be assigned to the union to report on its activities. The employer's objective is almost invariably to prevent the formation of a union or, where one exists, to destroy it. In some cases an agency is hired by an employers' association to prepare measures of opposition to unionism, such as a blacklist or an individual "yellow dog" contract.

Agencies also usually offer complete services for preventing or breaking strikes. Their undercover men carry on propaganda against a strike; the agency supplies strike breakers (in one case as many as ten thousand), guards and sluggers; and detectives operating in the ranks of the strikers report daily on the progress of a strike. When workers' leaders are arrested on trumped up charges, operatives testify against them and help manufacture evidence necessary to secure a conviction. Private detective agencies act as agents provocateurs as well as spies. Investigations have shown that operatives are often ordered to incite strikers to violence or to

11851

commit acts of violence to pave the way for injunctions, police attacks of workers and the creation of a public opinion unfavorable to the strike or the union. The history of American labor struggles gives many instances of detective agency violence. Noteworthy cases are on record in which detectives have resorted to assault, dynamiting, bomb and acid throwing, raids on strike relief stores, murder and other acts of repression and provocation. An agency has been known even to start strike agitation or to incite some form of violent outbreak of workers to secure a contract with a prospective client.

One method of destroying union morale is to bribe union leaders and to entice them to the pay roll of the agency. Many labor leaders in the United States tell of having been offered bribes by agencies acting for employers and corporations. Some leaders have in this way become the secret employees of agencies to which they report regularly.

Certain private detective agencies have offered special services in securing information on the operations, and in preparing blacklists of members, of radical political groups such as the Communist party and related organizations. Professional patriotic societies have employed such agencies for antiradical spying.

Most agencies have been organized and are staffed by ex-policemen and secret service men, and heads of the larger agencies have held the highest detective jobs with the federal government. Such men have at times used their official positions to advance their own interests. A former head of the Bureau of Investigation of the Department of Justice, for example, used government stationery on an antilabor investigation undertaken by his agency for a private client. Some agencies with political and underworld connections have refused to testify as to their activities before grand juries investigating thefts. Their intimacy with police officials and other persons of authority often places them beyond the reach of prosecution for crimes they have committed.

Various legislation has been passed or proposed to curb private detective agencies, especially in their antilabor activities. In twenty states private detective agencies are licensed by law. Each must pay a fee and put up a small bond. Operatives of such agencies are not usually required to have a license. In 1925 the state of Wisconsin passed a law requiring the registration and bonding of all "inside shop operatives." Although this law has somewhat

curbed industrial espionage in Wisconsin it has by no means put an end to the practise. While compelled in some instances to shift their licensed business offices to cities in adjacent states the agencies have continued their anti-union espionage in Wisconsin. Attempts by unions and progressive political groups to pass similar legislation in other states have been defeated. The complete abolition of private agencies, the raising of standards of vouched reliability and financial bonding for operatives, stricter licensing laws, federal licensing of all agencies engaged in interstate business, especially the transportation of labor undercover men, armed guards and strike breakers, have been proposed. In 1915 the Industrial Relations Commission urged congressional statutes regulating or prohibiting agencies and similar organizations. It urged the complete assumption of police duties by the states and municipalities and the prohibition of private detective agency police. None of these measures has been passed. Bills calling for the investigation of the acts of the agencies have been fought by the agencies and the industrial interests which use them.

Some private detective agencies exist in Europe, where they are active chiefly in divorce and business spying. Most European governments use official police detectives for espionage against working class and radical movements, and hence the private industrial spy and private detective espionage in trade unions are virtually unknown in Europe.

DETERMINISM in one form or another is the theoretical presupposition of all intelligent social activity. No social regulation could be under-

taken without the assumption that human behavior is largely influenced by certain factors revealed through a consideration of man's past. Reflection upon the extent to which we can rely on our neighbor's behavior indicates that a complete denial of determinism can be only an academic indulgence. It would make of all social existence and control an ever renewed miracle. When professed such denial means either a refusal to accept some particular definition of determinism or disbelief in its universality or an unwillingness to carry over some special type of determinism from one domain of experience to another.

Primitive man's mythology and religious practises express in large measure his desire to understand and control the exceptional occurrences in his environment. The attempt to formulate a theory of universal causation, however, comes rather late in human history. But as early as antique Greece there existed side by side the three generic theories which have dominated the history of European thought. One was the idea of fate, central to Greek drama and religion, a conception of the world order in terms of absolute decrees that fulfil themselves independently of natural mechanism or moral intent. It was a primitive form of cosmic predestination, dramatically conceived. In eschatological dress it reappears in the theological determinism of St. Augustine, Dante, Vico and Bossuet. The second, found in the philosophies of Plato and Aristotle, conceives the world order as a moral order. Things are defined in terms of their ends and purposes, which are organized hierarchically and are active in the process of world history. In the later forms of this teleological determinism, as represented by Hegel, Herder, Ranke, history is conceived as the autobiography of ideas or spirit. Finally, in the Ionic philosophies, and more definitely in Democritus of Abdera, we have the beginnings of scientific determinism. All occurrences are regarded as expressions of certain invariant principles indifferent to the needs of men and the will of God. The idea of an intelligible "order of nature," self-contained and transcendent—the source of all man is and the condition of all he can be—emerges as the guiding principle of scientific inquiry. In the sixteenth and seventeenth centuries, when the detailed characters of the "book of nature" were read by Galileo, Kepler and Newton, such scientific determinism became glorified as the method of all inquiry. In the eighteenth and nineteenth

centuries this conception of natural order and the methods used for its investigation became the model for such attempts to analyze the social order as those of Saint-Simon, Comte, Spencer and Schäffle.

A system is said to be determined when there are relations between any state of the system and certain elements, $e_1, e_2 \dots e_n$, such that, given the elements at time t , the state of the system at any other time t_1 can be inferred. It should be carefully noted that there is nothing in a determined system which makes it necessary that the relationships discovered to hold between any state of the system and $e_1, e_2 \dots e_n$ recur or endure forever. The common notion that in the proposition "if a occurs then b will follow" b must follow confuses logical determination with existential connection. The long continued association of a and b gives us a right only to a probable judgment about their further association. This probability is not merely a measure of our ignorance. To say that were we to know enough about the state of a system at any moment we should know everything about its future states is to utter a deceptive tautology, for it overlooks the fact that to know enough of a system we should already have to know everything about it. And obviously to know everything about a system the world would have to be over and done with, in which case the maxim would be useless since there would be no future to which it could be applied. So long, then, as the future event predicted has not happened there is a genuine contingency involved in its occurrence. We discount this contingency by erecting the invariance of law into a postulate of scientific inquiry, and a postulate, as Peirce said, is no more than "something we hope to be true."

Another contingent factor in every deterministic system is the point at which the system intersects with another system. The death of x , say, may be determined; but the exact place, time and occasion of his death is a matter of "relative accident." To say that anything is "relatively accidental" does not mean that it is uncaused but merely that it is not deducible from the data of the original system. For example, the breakdown of the rice economy in Japan was determined by the preceding social development; the visit of Commodore Perry by certain political considerations. The conjunction of both was relatively accidental. One event could not have been deduced from the other nor both from a third.

Finally, to say that a system is determined does not of itself tell us how it is determined. The specific terms or categories which are taken as determinants (particles of matter in motion, organic stimuli or ideal motives) cannot be inferred from the general fact that a system is determined. A system may be determined in several ways but not in the same respect. Failure to realize this is behind the many attempts to reduce all phenomena to variants of one special type of determinism.

In the physical sciences there has been considerable unanimity as to how the principle of determinism should be stated and the nature of the fundamental categories involved. In the social sciences, however, not only has there been no unanimity about the character of social causation but the very relevance of causal analysis of cultural phenomena has been denied, e.g. by Windelband and Rickert.

Those who believe that social phenomena can be scientifically investigated fall into two main divisions. One group maintains that whatever is socially determined is merely a complex function of the simply determined processes studied in the natural sciences. Whether this school calls itself mechanical, energetic, biological or psychological, its methodology is the same. Sometimes it is accompanied by a skepticism concerning the material possibility of social science because of the complexity of the subject matter. Other theorists, among them Marx, Durkheim, Simmel and Weber, maintain that social determinism is not reducible to the simpler forms of scientific determinism but has an autonomous character of its own with specific explanatory characters derived from the social activity of man. It uses the causal relations established by the physical sciences as elements in its own explanation but insists that in such cases the character of the explanation differs from the character of the elements.

Theological determinism is an exceptional type of deterministic theory. According to this doctrine whatever happens has been determined by God's will (sometimes read as fortune, fate or providence). It is indistinguishable from fatalism whenever it fails to specify how God's will works. This does not prevent those who profess it from putting lightning rods on church steeples. It survives in the writings of those who still see the finger of God in history. Nothing can possibly refute it, for it can always reinterpret the findings of experimental science. Since it can speak only *after* the event its wisdom

is of an easy *post hoc, ergo propter hoc* variety. Consequently, even as a postulate it is useless.

Physical determinism is an attempt to explain social phenomena primarily in terms of the categories of natural science. Sometimes the movements of material particles in space and time are taken as fundamental, as by A. P. Weiss; sometimes the dissipation of energy, as by Brooks and Henry Adams and by Ostwald; sometimes the processes of biochemistry, as by Lotka. The resultant "social physics" is then regarded as a complicated chapter in mechanics, thermodynamics, biochemistry, etc. The chief objections to this type of determinism are: (1) In explaining all phenomena in terms of one set of categories the specific and differentiating characters of social phenomena disappear. (2) Theoretically it is impossible to derive those features of qualitative novelty which practise compels us to recognize on different behavior levels. (3) As a consequence either such phenomena as feeling, will and purpose are denied, resulting in crude mechanistic materialism, as in Büchner; or in order to explain their existence they are read back as potentially present in all natural processes from the very start, resulting in metaphysical spiritualism, as in Fechner.

Geographic determinism, under which we may include all theories which emphasize climate, soil or food as determining factors of social development, traces the character of any culture and the changes within it to some relevant element of the physical environment. These interpretations follow the fortunes of the physical sciences. Valuable monograph work has been done in correlating certain social phenomena, such as suicide and marriage, with climate and fertility of soil. But the general claims made by theorists of this school from Buckle to Huntington are extremely speculative. Their chief difficulties are: (1) A confusion between necessary conditions of cultural activity and sufficient conditions. It is true to say that unless woods contained game there could be no hunting. But that does not mean that a people hunts because a wood is rich in game, for many tribes under such conditions live on vegetables. (2) They resort to problematic long distance influences exercised by the geographical environment upon factors which are apparently stable, such as race. (3) They minimize the significance of cultural diversity where the geographical environment is similar and of cultural similarity where geographical conditions are diverse.

Racial and biological determinism assign to a racial or to some other hereditary trait the status of an independent variable in the history and organization of society. The theory suffers from the same logical difficulties as do other monistic determinisms and, as expounded by its most influential representatives, Gobineau, Chamberlain and Pearson, from others as well. The fundamental concepts of race and native intelligence are seldom precisely defined. Value terms expressing subjective preferences creep into the use of epithets like superior and inferior. It cannot be too strongly emphasized that the influence of racial and other hereditary characters is never observable directly, since these traits are found existing in some specific cultural environment. Judgment as to the relative weight of innate capacity is consequently an inference based on the different rates and qualities of cultural achievement displayed by different groups in the course of history. But in order that the inference be valid we must show that in respect to environment, training and other relevant circumstances conditions were similar. This has obviously not always been the case. Hence all judgments about inherent racial capacities must be received with great caution.

Psychological determinism takes two generic forms. It is sometimes an attempt to explain social behavior primarily in terms of certain unconditioned responses (Thorndike's innate tendencies, W. McDougall's instincts, Freud's libido). All the objections urged against the other varieties of determinism apply to these schools. The opposite psychological standpoint is defended by the behaviorists, led by Watson. All social behavior is construed in terms of conditioned responses built up under the sole influence of the environment. This view assumes almost complete psychological plasticity on the part of the individual. It has even less experimental justification than the view it opposes. Both varieties of psychological determinism fail to do justice to the logical nature of meaning and to the historical character of culture. In addition, the first fails to explain the different expressions of instincts assumed to be constant; the second, the widely divergent responses on the part of different individuals who have been developed in similar environments.

Social determinism embraces all theories which seek to explain the structure and development of culture in terms of man's social environment. It is clear that the social environment as a whole cannot be regarded as the proximate cause

of any specific event. Nor is the tautology that the whole social environment at time t is the cause of the whole social environment at time t , any more enlightening. Consequently, it is always some element or series of elements in the social environment which is regarded as the key factor to cultural change. This may be the mode of economic production, as in Marx, or the system of jural relations, as in Stammler, or the forms of religion, as in Weber, or some combination of these with others.

Every form of social determinism implies that cultures are morphologically determined. Before attempting to explain the nature of cultural change it must therefore first reconstruct the structural pattern of a given culture complex. By using the logic of the part-whole relation it must reveal the intimate ways in which different cultural activities—ideas, institutions, habits—dovetail with one another. For example, in discussing Greek culture it attempts to lay bare the thread of organic unity which connects Greek religion with Greek art, philosophy, occupational activity and political history. Or in approaching feudal culture it reveals how such apparently unrelated things as a mediaeval cathedral, the realistic theory of universals, the principles of canon law and the system of land tenure are organically involved in one another and are not at all accidental conjunctions of independent cultural elements.

But culture is not only a structurally interrelated whole. It is a developing whole. Consequently, the results of morphological analysis only set the proper tasks of social theory. These are: What elements or combination of elements constitute the dynamic factors (independent variables) in social change? What is their comparative strength? What the resultant rate of change? Due to the enormous complexity of the elements involved, the difficulty of experimental control and the absence of a theory of measurement no body of detailed objective results has emerged comparable in any way to the achievements of other sciences. But perhaps the chief obstacle to the development of a scientific theory of social change has been the use of a crude, monistic theory of causation. Some single factor has been isolated and all other cultural changes simply explained in terms of its changes. This has often led to a disregard of the facts of reciprocity and interaction between social factors, to an attempt to call the reality of cultural effects into question (social epiphenomenalism; for example, the effective

role of ideals in history is sometimes denied because they are causally conditioned by some material factor) and to a quest for remote ultimate causes of events instead of their proximate causes.

The substitution of a functional conception of causation for a simple monistic theory of cause and effect is a safeguard from errors of this kind. Under the influence of positivist thinkers like Mach, Avenarius and Verworn, the tendency today is no longer to lay down flat unverifiable statements, for instance, that religion is the "primary" or "basic" or "most important" cause of cultural change. The relationship is expressed in terms of function, dependent and independent variables. If religion is selected as the independent variable, then we try to discover the definite ways in which other aspects of culture, for instance, the legal, vary with changes in religious conceptions [symbolically, $l=f(r)$]. But there is no logical compulsion to take religion as the independent variable. We could have taken art or politics or economics as independent variables and traced the functional dependence of law upon them [getting a whole series of relationships, $l=f_1(a)$; $l=f_2(p)$; $l=f_3(e)$]. Or we could have reversed the original function, taken law as the independent variable and shown how religion varies with its changes [$r=f_4(l)$]. Strictly speaking, neither the one nor the other member of the functional equation can be called cause or effect. Theoretically there is no limit to the number of functional correlations which may be so established nor to the complexity of such correlations. For we might take the functional relationship between any two variables, say religion and law, and try to show that the change in the function which relates the two is itself a function of some third variable, say economics [symbolically, $l=f(r)$ or $F(r, l)=0$; but it may be that $F=\phi(e)$]. What, then, determines the specific functional relations for which we are to seek?

This last question indicates that the quest for direct causes is not incompatible with the establishment of functional dependences in the social sciences. The reason we seek to establish one set of correlations rather than another can be found only in the assumption of some hypothetical causal connection between the elements so related. In many instances we disregard the presence of high positive correlations between two phenomena because we do not believe we have evidence of significant connection. Why is it that we take the positive functional correla-

tions established between the business cycle and tuberculosis as more probably indicating relevant connection than the even higher positive correlations between the business cycle and cancer? The question of causal agency is not at all academic; since for purposes of social control we must know which element in the functional relation must be changed. The element which must be changed we regard as the cause. The relevance of one element to another in a culture complex can never, then, be ascertained merely by a functional correlation, for the obvious reason that an antecedent hypothesis as to relevant causal connection must guide the search for correlations.

The functional theory of causation together with all the apparatus of statistical inquiry is invaluable in accumulating data to be interpreted. It can also establish the irrelevance of any two elements in the social environment assumed to be causally connected. Of itself, however, it cannot offer an explanation of the correlations found. Only some causal theory can do that. Such a theory will be, as we have seen, pluralistic rather than monistic. Its chief problem is to develop a theory of measurement to determine the relative weight of the various causal factors considered.

DEVALUATION is a term applied to a series of legislative enactments by which a new legal value is assigned to a depreciated monetary unit and a new settlement is decreed for all contracts in monetary terms. Generally devaluation involves a reduction of the bullion content of the monetary unit in order to assure approxi-

Determinism—Devaluation

mate equality between the open market value of the metal and the actual purchasing power of the monetary unit and aims at a resumption of the redemption of money in specie; that is, a restoration of the metallic standard of the currency.

In the course of devaluation the old monetary unit may be retained and its bullion content fixed for the first time, or *de novo*. This type of devaluation, sometimes called *de jure* stabilization, was effected in Argentina in 1899, in Czechoslovakia in 1925 and 1929, in Italy in 1927, in Poland in 1927 and in France in 1927. But devaluation may sometimes involve also the introduction of a new monetary unit with a fixed bullion content. The old money is then exchanged for the new, which is in its turn directly or indirectly redeemable in specie. Examples of this type of devaluation are found in Austria-Hungary in 1892, Russia in 1896 and at least nominally in 1924, Germany in 1924, Austria in 1924, Poland in 1924, Hungary in 1925 and Belgium in 1926. This type of devaluation should be distinguished from repudiation of the old money, when the old money is declared completely worthless or is exchanged for government obligations, as well as from cases in which the new monetary unit is merely a multiple of the old, as in Russia in 1922. A different type of devaluation is that which assigns no fixed bullion content to the new monetary unit or does not provide for its free redeemability in specie. The devaluation in France in 1795, Austria in 1811, Argentina in 1882 and Russia in 1839 approaches to some extent the latter type.

Devaluation is a method of currency stabilization. It must be preceded therefore by measures designed to remove the factors responsible for the breakdown of the currency system. Among them the most important are budgetary deficits covered by paper money issues, unwise economic and social policies leading to extravagance in expenditure, and natural catastrophes. The obvious remedy in all of these cases is retrenchment in expenditure and an increase in public revenues. The next step is the restoration of confidence in the stability of the currency. To accomplish this revenue from specific sources may be earmarked as a guaranty of the successful execution of the reform. In many cases, when the country is poor or the process of economic dislocation has progressed too far, revenues are earmarked as security for a foreign loan obtained to facilitate stabilization. The

proceeds of such a loan are used budget, to combat currency speculation, to adjust temporarily the balance of foreign payments. Such cases were particularly frequent after the World War, France being the only country which succeeded in devaluing its currency without foreign help. In this period the assistance of the League of Nations and the cooperation of central banks of foreign countries played prominent parts.

The new mint standard, i.e. the new value of the monetary unit, must be fixed with due regard to eventual stabilization of the currency more or less on the basis of the actual purchasing power of money. The point of reference may be either the external purchasing power as measured by foreign exchange quotations or the internal purchasing power. There are historical examples of deviations from this course which were dictated by political considerations or technical currency difficulties. Where the prestige attaching to a high value forces devaluation on a level above the actual purchasing power, unnecessary business complications may ensue and the reform be jeopardized. On the other hand, devaluation at a level lower than actual purchasing power speeds up the liquidation of the public debt, allows for a further utilization of the printing press to tide over the transition to a balanced budget and by stimulating exports minimizes the difficulties connected with the balance of foreign payments—advantages that might outweigh the additional sacrifice which is thereby imposed upon the *rentier*.

Extension of the legal revaluation of money to all existing credit relations is an integral part of the devaluation reform. A devaluation of the currency in circulation, not accompanied by a corresponding regulation of credit relationships, amounts to a deflation of the worst type. Moreover, extension of devaluation to existing debts comes naturally where the necessity of revaluing the public debt is one of the principal reasons for undertaking monetary devaluation.

The devaluation of debts may amount merely to a substitution of the devalued monetary unit for the old one, disregarding the change in the value of the monetary unit; this is the provision of article 1895 of the civil code and of the decision in the Mixed Money Case [2 State Tr. 113 (1605)]. The other possibility is a complete or partial valorization of the current debts. In some cases, as in Germany in 1925, the valori-

zation is made retroactive, so that either additional payments are required or cancelation of contracts is permitted under certain circumstances. When valorization is left to the courts each case is judged on its own merits, and such considerations as the purpose for which the loan was made and the material circumstances of the parties are taken into account. When done by statute the value of money at the time the debt was contracted is the sole consideration, and valorization is effected on the basis of specially constructed tables. The tables are based on either price indices or gold quotations and may be uniform for the entire country or differentiated by regions. The debtors are often granted a moratorium and a low interest rate on the valorized debt. While a valorization of debts may not remedy all the violations of equity and justice entailed by currency depreciation it is nevertheless of considerable value, particularly for its psychological effects.

Valorization of the public debt is less frequent, since it may endanger the balancing of the budget. This sometimes leads to a decision not to valorize private obligations, justified by the legal fiction that a dollar is always a dollar irrespectively of its actual value. When the public debt is valorized a reduction of the interest rate and even a complete suspension of interest payments are often enforced. A similar purpose is served by a forced funding of the floating debt, the repayment of which would aggravate currency disorders. The original purchasers of government obligations, particularly those of the poorer classes, are often treated less harshly. Foreign loans are likely to involve special problems.

Devaluation reduces the legal value of paper money, which is in a sense evidence of a forced loan to the state; for this reason devaluation has in the past been feared as a damning admission of national bankruptcy. This sentiment is still current in certain circles and has caused some governments to hesitate in undertaking stabilization of currencies on the level of their post-war values. The legalistic consideration of currency disorders aroused criticism even in the nineteenth century. It is patent that paper money differs from ordinary government obligations because it circulates as currency and is endowed with the legal tender privilege. A recognition by the government of its paper money obligations in full, that is, raising the purchasing power of paper money to par, would necessitate a reduction in the

quantity of it in circulation, or a resort to deflation.

Whether accomplished through a forced exchange of a part of the paper money, interest bearing government obligations, or through other measures carried out by the treasury and the central bank, deflation engenders a new price revolution affecting all credit relations. The more serious the depreciation which has taken place, the more protracted is the period of deflation accompanied by painful social and economic readjustments. The restoration of the value of money and private debts thus effected is not certain to remedy the social injustice caused by the preceding inflation. It is impossible to ascertain who has been affected by the depreciation and what has been the extent of losses. Many debts are paid before restoration occurs and many others are transferred to third parties, who are probably persons who have speculated on the possibility of profiting by just such a measure. Again, a deflation policy increases the burden of the public debt and of taxation, retards economic reconstruction and may necessitate a renewed resort to paper money issue. A long period of instability which is likely to follow an untimely deflation affects confidence abroad even more injuriously than a devaluation reform.

Expediency rather than abstract reasoning must decide whether devaluation or deflation is the proper policy under given circumstances. While the extent of actual depreciation is an important consideration it is not necessarily decisive; in two countries whose currencies are equally depreciated other economic factors may throw the balance in favor of devaluation in one case and of deflation in the other. At any rate the international monetary conference at Genoa in 1922 advised against the return to pre-war parities in all countries where currencies were substantially depreciated, and this advice was followed almost without exception. Even those governments which dreaded it were forced by the pressure of events to resort to devaluation.

DEVAS, CHARLES STANTON (1848-1906), English economist. During the period following his appointment to the professorship of political economy at Catholic University College in 1876 Devas, a convert to Catholicism, became the ablest and most influential economist of his faith in Great Britain. It was from his addresses and writings, especially his *Manual of Political Economy* (London 1892, 3rd ed. 1907), that the British social Catholic movement, which since its origin had been preoccupied with merely negative criticism leveled either against particular evils such as intemperance, the sweating system and pauperism or against socialism, first received the outlines of a social code, which was at once scientific, comprehensive and progressive. The effect of his doctrines became apparent when in 1909 the movement assumed organized form as the Catholic Social Guild. While Devas rejected socialism as impracticable he recognized that its indictment of the existing order was to a considerable extent justified and that many of its constructive proposals were both ethically and economically sound. But socialism was, like individualism, a "vicious extreme." Regarded realistically the choice which society must make lay between rampant capitalism and capitalism socially controlled in the interest of individual welfare and with a view to the perpetuation of family life, an end to which, as his *Studies in Family Life* (London 1886) evinced, he attached fundamental importance. Unhesitatingly repudiating the former alternative he advocated adequate labor unions, labor sharing in industrial management, progressive income and inheritance taxes, public control of prices, and social insurance. He even went so far as to deny the necessity of interest on capital, holding that the capitalist receives "ample reward without any need of any interest on capital." Devas' entire program of social control was grounded in the doctrine that the state served an ethical purpose. In his treatment of economic theory also he constantly reiterated the necessity of regarding economics as essentially "ethical, the application of the moral law in particular departments of human life" ("Les-

sons from Ruskin" in *Economic Journal*, vol. viii, 1898, p. 28-36). Devas' demonstration that the "economic man" was not only morally repellent but inadequate as a scientific concept exerted wide influence among economists and represents his greatest achievement in the theoretical sphere.

DEVOLUTION. See DECENTRALIZATION; HOME RULE.

DEW, THOMAS RODERICK (1802-46), American educator and publicist. In 1826, six years after his graduation, Dew was appointed professor of political law in the College of William and Mary, which since the beginning of the century had taken the lead among American colleges as a center for instruction in the social sciences. In his courses, which covered history, metaphysics, government and political economy, he carried his students beyond the limits of the rather inadequate textbooks then in use in American colleges. His *Digest of the Laws, Customs, Manners, and Institutions of the Ancient and Modern Nations* (New York 1853), first printed for the use of his students, showed the author's appreciation of the importance of human institutions in the teaching of history and was considered especially valuable for its unusually full treatment of more recent movements such as the Renaissance, Reformation and the French Revolution.

Dew's influence extended, however, far beyond the classroom. His exhaustive defense of slavery as a social and economic system (*Review of the Debate in the Virginia Legislature of 1831 and 1832*, Richmond 1832; reprinted in *The Pro-Slavery Argument*, Philadelphia 1853, p. 287-490) had a larger influence in bolstering the institution in the South than any other book of the early period of the slavery controversy. His fund of historical knowledge enabled him to clothe the familiar proslavery arguments of the time with the authority and sanction of the past. Rome, whose civilization represented his ideal, was able, thanks to its slaves, to foster a leisured class devoted to culture and to grant to women

the high position of which they were worthy; while Sparta was instance enough that slavery was not incompatible with republicanism. Although disturbed by the failure of the South to maintain its economic progress in comparison with the other sections of the country he refused to attribute this failure to any evil effects of slavery, finding the explanation rather in the high tariff, which was sacrificing the agricultural interests of the South to the demands of the northern industrialists—a policy which if pursued would lead to disunion. His *Lectures on the Restrictive System* (Richmond 1829), which relied in the main on the physiocrats and on Smith and Say, espoused the classical free trade argument and are said to have been influential in bringing about the tariff reductions of 1832. His *Essay on the Interest of Money and the Policy of Law against Usury* (Shellbanks, Va. 1834) reveals his concern for the agriculturist as “the great paymaster to all the other classes of productive and unproductive laborers” and his opposition to any artificial restriction of credit.

DEZAMY, THÉODORE (1803-50), French communist. Dezamy wrote a number of communist and anticlerical works, edited *Égalitaire* (2 issues, Paris 1840), *Communautaire* (1 issue, Paris 1840) and the *Almanach de la Communauté* (Paris 1843). He was a leading representative of the Babeuf tradition in the decades preceding 1848. Dezamy worked with Cabet for a while and later projected a communist utopia which owed much to Fourier and Cabet. His system would replace the family by a community of some ten thousand souls, united by ties of brotherly affection with a common dwelling place; man would express his nature freely and completely and in doing so always act in the social interest. He proposed relative not absolute equality of distribution. Dezamy sharply attacked Cabet's conciliatory tactics and opportunism, rejecting his appeal for bourgeois aid for the working class as unrealistic and calling upon the proletariat to unite and free itself. He emphasized the necessity of including peasants in all communist calculations. Cabet proclaimed himself first a Frenchman, then a communist; Dezamy proclaimed himself a communist above all. Cabet characterized Dezamy as an extreme

demagogue and a violent communist; Dezamy questioned both Cabet's good sense and his good faith. There is much support in Dezamy's writing for Sombart's contention that he anticipated Marxian revolutionary socialism. But while Dezamy's emphasis on materialism, atheism, science and class struggle is proto-Marxian, his program was stated only in the most general terms, his proposed goal was utopian in character and he evolved no precise tactical formulations. In 1848 Dezamy ran for the National Assembly as a “radical socialist.”

Paul (London 1930); Delevsky, J., *Les antinomies socialistes et l'évolution du socialisme français* (Paris 1930) p. 160-73.

DIABOLISM, the belief in a personified agency of evil commonly called the devil, may be traced back to the animistic attitude which saw behind natural events active, creative spirits, both good and evil. Gradually the demons behind good acts came to be conceived as subordinated to a good god and the demons behind evil acts as subordinated to an evil spirit. The conception of a maleficent power is probably of greater antiquity and stronger potency than the idea of a benevolent deity; for fear has been considered the first incentive of religious worship and propitiation of harmful powers regarded as the first phase of all religious ceremonies.

The worship of the devil as creator of the world and author of evil has continued to play a prominent part in the history of religions. The belief in an independent power of evil working in this world is indeed an integral, essential element in all organized religions. The introduction into a religious system of an antagonistic deity serves the purpose of isolating the domain of evil. This tendency of relieving the beneficent deity of the responsibility for evil by ascribing its origin to another and maleficent power is well illustrated in the Old Testament. In *I Chronicles* xxi: 1 Satan is introduced to do the work of temptation to evil

which in *II Samuel* xxiv: 1 was ascribed to Jehovah himself.

The monotheism of the ancient Hebrews did not permit the development of a power acting independently of the deity. Satan, the "assailant," the "accuser" (Greek *diabolos*), is in the Old Testament not an adversary but an adjutant of the Almighty. Whether he acts as the enemy of the nation (*Zechariah* III: 1-2) or as the slanderer of righteous men (*Job* 1: 9) he is counted among the "sons of Elohim." He is a member of the celestial court and stands high in the councils of Jehovah but sits on the opposition bench. He is a kind of prosecuting attorney attached to the judgment seat of the Eternal.

The opposition of good and evil was carried to its most logical consequences in the Zoroastrianism of Persia, where Ahriman, the spirit of darkness and evil, holds a completely independent position, constantly menacing the powers of light. During the Babylonian captivity the Jews came in contact with these ideas and to some extent modeled Satan upon the pattern of Ahriman. This conception of Satan as the enemy of Jehovah continued to expand in post-exilic Judaism and was reproduced in the earliest parts of the New Testament. But it was reserved for the church fathers to develop the belief in the devil into a dogma. Although the devil never played an important part in Judaism he is the fount and foundation of the Christian religion. Indeed, the whole Christian system of salvation is based on the belief in the devil, since no need would exist for salvation through Christ if Satan were not present to tempt man to sin.

It is worth while to trace in detail the history of Satan, not only because he is one of the best known of the representatives of evil but because the story of his successive transformations throws much light on the nature and significance of diabolism. There is found in post-exilic Judaism, simultaneously with the development of the conception of a powerful spiritual adversary, the elaboration of the myth of the fallen angels, of whom Samael or Satan was the leader. The origin of this myth is in *Genesis* vi: 1-2, but the *Book of Enoch* seized upon the material and expanded it at great length. In this apocryphal work the sin of the angels, which brought about their fall, is ascribed to their carnal relations with the daughters of men. The New Testament account of a war in the skies, which resulted in the defeat of Satan and his fall like lightning from heaven

(*Luke* x: 18; cf. *Revelation* ix: 1), is based, however, upon another apocryphal book, the *Wisdom of Solomon*, which attributes Satan's sin to envy. The Talmud and the Koran explain this as envy of man, who was created by the Lord as the king of this earth. Many church fathers, among them Irenaeus, shared this view. The orthodox teaching of the Christian church, however, is that Satan's rebellion and expulsion from heaven were the results of his envy of the Lord, whom he wished to replace in the government of this earth; and that the creation of man, far from causing the rebellion of the angels, resulted from it. Adam was created by the Lord for the express purpose of filling the vacancies caused in the celestial choir stalls by the fall of the angels. As soon as the devil learned that the seats which he and his angels had vacated in heaven were to be occupied by a new generation, of whom Adam and Eve were to be the parents, he determined to balk the sacred will of the deity with regard to the destiny of man. Disguised as a serpent Satan tempted our first ancestors to sin and was thus instrumental in driving them out of Eden and depriving them of the possibility of substituting for him in heaven. The serpent of *Genesis* (ch. III) was developed into Satan only through the interpretation of the later Jews (*Wisdom of Solomon* II: 24), an interpretation which passed over into the Christian faith (*Revelation* XII: 9; XX: 2). Through this master stroke Satan succeeded in obtaining from God the assignment of the human race as his property. All men by reason of the fall, according to the teachings of the church fathers, became the rightful property of Satan and had to be bought from him by the vicarious death of Christ, who was the ransom price of humanity. But although Christ's First Advent delivered mankind from the powers of Satan, the latter's overthrow will be completed, according to the doctrine of the church, only by the Second Advent. Although laid in chains by Christ the devil directs his work on earth from his dungeon and effects his will among men through millions of messengers. The church has swelled Satan's ranks by subjecting to him all the heathen deities. The diabolization of the gods of alien faiths or rival sects is a typical theological practise. A new religion never actually rejects the gods of the preceding religions which it has replaced and which it combats; it adopts them but assigns to them a maleficent character. The ancient Hebrews already considered the gods of the

nations with which they were at war as devils; and the numberless dethroned, outlawed and fallen gods of the subjugated races and discredited religions changed, for the Christians, into demons. In the course of this process Satan himself assimilated many of the characteristics of the discarded deities of the old religions—certain details of dress, traits of character or tricks of manner. The identification of the devil with the uncouth northern giants was especially momentous for the transformation of his character from the height of terrible power to the plane of pictured grotesqueness.

Within the church there have always been sects which carried on devil worship. Among the groups which continued within Christianity the traditions of Persian Magianism, Gnosticism and Manichaeism, were the Priscillianists, the Paulicians, the Bogomiles, the Catharists and the Luciferians. The mediaeval witch cult, on the other hand, which was regarded by the church as devil worship, was merely a survival of the old indigenous heathen religions that covered Europe before the advent of Christianity. Inasmuch as the Christians identified the indigenous gods with their devils, the ritual of the domestic deities, to which the masses clung tenaciously for centuries, was decreed by the church as devil worship, and their priests and priestesses were branded as wizards and witches. Jews, Turks and heretics in addition to the heathen were believed in all Christian lands to be allies of the infernal powers. The mediaeval church was emphatic in its assertion that all who did not seek salvation in its bosom served Satan. When the church at the advent of the Reformation was divided against itself, each part accused the other of serving Satan. The Protestant sects, warring among themselves, accused each other of connections with the powers of darkness.

The fathers and doctors of the church expressly and explicitly developed and elaborated the personality of evil for the greater glory of God. The devil was represented as the completest contrast to the deity, the fiend in hell set up as a foil to the Father in heaven. The similarities in creed and cult between Christianity and paganism were interpreted as infernal counterfeits of eternal verities. The devil, who always wished to rival the deity, developed his domain in all details after the pattern of the celestial organization. Satan as *simia Salvatoris* also has a mother, who as queen of hell is the exact copy of the queen of heaven, Antichrist

as the foil of Christ (*II Thessalonians* II: 3-10) will in the end of days be born of a Babylonian virgin and the devil, just as Christ was born of a Palestinian virgin and the Holy Ghost.

The devil was regarded as not only the hierarch of hell but also the prince of this world (*John* XII: 31; XIV: 30; XVI: 11) and even the god of this world (*II Corinthians* IV: 4). If he was not considered by Catholicism as the creator of the cosmos he was at least regarded as the master of the material world in contrast to the spiritual world, which was the domain of the deity. The church was concerned with heaven, consigning to the devil the possessions and deeds of the earth. All mundane pursuits, professions and pleasures of man were under his protection. Satan was regarded as the incarnation of human reason in contrast to the Savior, who represented faith. To the dominion of the devil the church handed over all sciences and arts. The fiend was also credited with all aspirations for improvement in every field of human activity. He represented the discontent with existing conditions in matters social, political and ecclesiastical. He was identified with the spirit of progress so disturbing to the ruling powers in church and government. Every democratic institution, every social reform, was attributed by the reactionaries to the machinations of the spirits of hell.

The belief in the devil was at its height in the last centuries of the mediaeval period. The Reformation, if anything, increased the devil's power by withdrawing from the saints the right of intercession on behalf of sinners. Martin Luther saw in Satan a real living power, who was incessantly working in human affairs. John Wycliffe in his great treatise *De dominio divino* (c. 1375) went so far as to imply that here on earth God must obey the devil. The belief in the devil as the controlling power in this world was very strong in Protestantism throughout the sixteenth and seventeenth centuries. But eighteenth century rationalism undermined belief in the devil as in all supernatural agencies, and by the nineteenth century in large sections of the western world the devil had been relegated from the citadel of asserted belief into the vaguer regions of poetic fancy. Primitive peoples in various parts of the world, however, still carry on devil worship: among them the Yezidis of Mesopotamia, the black Jews of Cochinchina and the Voodoos of the West Indies and Haiti. There are devil worshiping cults also in the north of China, in the south of India, in

Africa, in the Solomon Islands and in the New Hebrides. Belief in sorcery is also still extant in rural districts throughout most of the western world. A cult of Satan was also carried on as a dilettantist fad among cultured classes in various European capitals toward the end of the nineteenth century. The contemporary cult of Satan, however, is primarily a diabolism of debauchery, and the principal part of the modern Black Mass consists of sexual perversions of all kinds. On the other hand, the accusations of devil worship made against the Masons, with which France was flooded toward the end of the past century and which were called forth by the papal encyclical *Humanum genus*, were wholly without foundation. But if diabolism has lost its compelling religious character, the concept of the personification of evil has continued to play an important part in the history of ideas.

The legend of Lucifer, as solving the problem of the origin of evil and the birth of man, has always been a subject full of fascination for the poet just as *diabolus* has been a principal motif for the world's greatest literary masterpieces. But since the devil is what men make him he changes with changing temporal, national and individual attitudes. In modern literature his chief function has become that of a satirist of human institutions, directing the shafts of his sarcasms against all the faults and foibles of men. Among the recent demonstrations of the devil's ability as a satirist of manners and morals are Mark Twain's posthumous romance, *The Mysterious Stranger* (1916), and Leonid Andreev's similarly posthumous work, *Dnevnik Satany* (Helsingfors 1921; tr. by H. Bernstein as *Satan's Diary*, New York 1920).

The adversary's outward appearance too has changed in recent times. The modern devil is as fascinating as his predecessor was dismal and dreadful. The devil has fully discarded his animal parts and has turned human—all too human for most of us. Marie Corelli in *The Sorrows of Satan* (1895) describes the devil as of extraordinary physical beauty, fascination of manner and splendid intellectuality. To that dignity of person, which in part is already found in the Miltonic Satan, the modern devil has added a corresponding nobility of character.

The devil, as Renan has aptly remarked, has benefited chiefly by the relativist point of view in ethical judgments, which no longer permits any rigid interpretation of good and evil, any strict division of men into saints and sinners.

The spirit of evil is better than he once was, because evil is no longer so bad as it was. As a result the devil has come to be regarded as one of the instruments in the government of the world and the education of mankind. He has been used as a symbol for our progressive, inquisitive nature, which will not permit us to remain satisfied with what we have already achieved but urges us on to higher and nobler aims. Of course the older dogma has not entirely disappeared; writers loyal to Catholic teaching and tradition have continued to see in Satan the symbol of all evil in the world. We need but refer to the neo-Catholic writer, Georges Bernanos, author of the novel *Sous le soleil de Satan* (1926), which achieved a great success upon its publication.

Many thinkers of the nineteenth century, having found such great improvement in the character of the devil, predicted his pardon and purification. This idea of the end of the devil's doom is from the philosophical point of view the corollary of the belief in the essential unity and final identity of good and evil held by many modern metaphysicians. From the aesthetic point of view it forms a part of romantic humanitarianism, which a misanthropic humorist has named redemptorism, that is, the wish to redeem all criminals by means of love. The pity which the romantics felt for all sinners was also extended to Satan. The sympathy shown by the romantics for all social and political victims could not be denied the devil, all the more on account of the kinship they felt for him. The rebel poet reached out his hand to the rebel demon. The man in opposition to society had a fellow feeling for the angel who raised the standard of revolt in heaven.

Just when good churchmen and churchwomen of all sects were discarding the devil from their dogma, many writers who will certainly never receive canonization were developing a belief in the devil. Thus Victor Hugo like many other romantics deduced from the existence of evil, "that terrible sphinx propounding a terrible riddle," the existence of an evil being. "It is this perfection of Evil," he says in *Les travailleurs de la mer* (1866), "which has sometimes sufficed to incline powerful intellects to a belief in the duality of the Deity, toward that terrible *bifrons* of the Manichaeans. It is certain that Evil at one end proves the Evil One at the other." The conception of evil, however, has changed as a result of changing ethical, social and political ideas. In the Cath-

olic Middle Ages the devil was chiefly the enemy of the church of God, endeavoring to bring about its overthrow by inspiring heterodox views in the minds of men. Protestantism attributed to the evil spirit such crimes as Sabbath breaking, music making, attendance at the theater and dancing. In the nineteenth and twentieth centuries Satan was for many the personification of all unwarranted social discontent, while for others he became the incarnation of social and political evils; Victor Hugo considered him as the personification of physical violence.

Many pessimists of the nineteenth century, believing in the reality of evil, went to the extreme of exchanging the traditional roles between the deity and the devil. As they thought ill of the world, they could not but think ill of its Creator and Ruler. If the Christian teaching of purification through suffering is to be abandoned, there is no escaping from the inference of the romantics that the author of an evil world must necessarily be evil. Just as pessimism leads to antitheism, antitheism leads to Satanism. If what has been considered good is found to be evil, what opposes it must necessarily be good. Thus the disparagement of the deity led to the sanctification of Satan. This paradox accounts for the belief held by many romantics that Satan was wronged and that there was a historical case to be judged anew before the court of our conscience.

Such reasoning led to a reversal of poetic judgment with regard to the events which supposedly happened in the heavens in the dim beginnings of history. During the period of the romantic revolt in all European countries Satan was considered a Prometheus of Christian mythology. In the modern version of the war in heaven Satan was actuated not by hatred and envy of man but by love and pity for mankind. His attempt to overthrow God's government had for its aim the liberation of the world from celestial tyranny. Satan was hailed as the vindicator of reason, of freedom of thought and of an unfettered humanity. The French romantics saw in him the greatest enthusiast for the liberty and spontaneity of genius, the sublimest and supreme incarnation of the spirit of individualism, the greatest symbol of protest against tyranny, celestial or terrestrial. It must not be denied, however, that the devil in the poetry of the past century was also the personification of the evil which is adored rather than abhorred. Among the romantic

writers many may be named who were led to their admiration for Satan through their love of sin. Instead of exchanging values they accepted the traditional conception of the deity and the devil but nevertheless substituted Satan for the Savior in their adoration. These *advocati diaboli* were not satisfied with leading the devil back to his former paradisiacal position but even wished him after his restoration to carry out the project which he failed to accomplish before he was hurled from heaven. They expected him again to start the revolution he had headed in the beginning of time and supplant the king of heaven in the government of this earth. Another point of view appears in Anatole France's *La révolte des anges* (1914), where Satan declines an opportunity to head a second rebellion, since he knows that the successful rebel turns reactionary, and prefers to remain the oppressed rather than to become an oppressor.

Many poets and playwrights of the past century held Satan in high esteem. Baudelaire in France, Swinburne in England, Strindberg in Sweden, Dehmel in Germany, Carducci in Italy and Cranch in the United States clothed the devil in such mighty splendor that his glory almost "compels the knee to bend." In *Inno a satana* (1863) Carducci represents the devil as "the immortal enemy of autocracy and the standard-bearer of the great reformers and innovators of all ages." His contemporary and compatriot Mario Rapisardi hails in Lucifer the savior of society, who will accomplish the social revolution which is now preparing in all European countries and bring a new era for mankind, in which social as well as political equality will be effected. Thus has "the revaluation of old values," advocated by Nietzsche, transformed the demon of darkness into a light for the living.

DIALECT. This term has a connotation in technical linguistic usage which is somewhat different from its ordinary meaning. To the linguist there is no real difference between a dialect and a language which can be shown to be related, however remotely, to another language. By preference the term is restricted to a form of speech which does not differ sufficiently from another form of speech to be unintelligible to the speakers of the latter. Thus Great Russian and White Russian are said to be dialects of the same language. Similarly, Alsatian, Swabian and Swiss German are dialects or groups of dialects of a common folk speech. Literal mutual intelligibility, however, is not a criterion of great interest to the technical linguist, who is more concerned with the fact and order of historical relationships in speech. To him Venetian and Sicilian are equally dialects of Italian, although as far as mutual intelligibility is concerned these two might as well be called independent languages. Russian, Polish, Czech, Bulgarian and Serbian, conventionally considered as independent languages because of their national affiliations, are no less truly dialects of a common Slavic speech or linguistic prototype than Venetian and Sicilian are dialects of a supposedly common Italian language. If two obviously related forms of speech are spoken at the same time, the linguist does not say that one of them is a dialect of the other but that both are sister dialects of some common prototype, known or inferred. When they diverge so far as not only to be mutually unintelligible but no longer to be too obviously related to each other, the term language is more freely used than dialect, but in principle there is no difference between the two. Thus in a sense all Romance languages, all Celtic languages, all Germanic languages, all Slavic languages and all Indo-Aryan ver-

naculars are merely dialect groups of a common Aryan or Indo-European language.

A group of dialects is merely the socialized form of the universal tendency to individual variation in speech. These variations affect the phonetic form of the language, its formal characteristics, its vocabulary and such prosodic features as intonation and stress. No known language, unless it be artificially preserved for liturgical or other non-popular uses, has ever been known to resist the tendency to split up into dialects, any one of which may in the long run assume the status of an independent language. From dialects formed by inherent differentiation one may distinguish dialects which owe their origin to speech transfers. A community which takes on a language that is different from the one to which it has originally been accustomed will unconsciously carry over into the adopted language peculiarities of its own form of speech which are pronounced enough to give its use of the foreign language a dialectic tinge. Many linguists attach much importance to the influence of superseded languages in the formation of dialects. Thus some of the distinctive peculiarities of both Celtic and Germanic are supposed to be due to the retention of phonetic peculiarities of pre-Aryan languages.

In less technical or frankly popular usage the term dialect has somewhat different connotations. Human speech is supposed to be differentiated and standardized in a number of approved forms known as languages, and each of these in turn has a number of subvarieties of lesser value known as dialects. A dialect is looked upon as a departure from the standard norm, in many cases even as a corruption of it. Historically this view is unsound, because the vast majority of so-called dialects are merely the regular, differentiated development of earlier forms of speech which antedate the recognized languages. Popular confusion on the subject is chiefly due to the fact that the question of language has become secondarily identified with that of nationality in the larger cultural and ethnic group which in course of time absorbs the local tradition. The language of such a nationality is generally based on a local dialect and spreads at the expense of other dialects which were originally of as great prestige as the culturally more powerful one.

Of the large number of dialects spoken in Germany, German Switzerland and Austria, for example, very few, if any, can be considered

as modified forms of the culturally accepted *Hochdeutsch* of literature, the pulpit, the stage and general cultural activity. The dialects of the German speaking folk go back unbrokenly to the Old High German of early mediaeval times, a German which was even then richly differentiated into dialects. The present standardized German of the schools arose comparatively late in the history of German speech as a result of the fixing of one of the Upper Saxon dialects as the recognized medium of official communication within the German speaking dominions. Luther's Bible helped considerably in the diffusion of this form of German as the recognized standard. It has taken a long time, however, for *Hochdeutsch* to take on a recognized phonetic form and to be looked upon as a well standardized form of oral communication, and to this day a large proportion of Germans, including the educated ranks, are bilingual in the sense that they use the standardized German for formal purposes but employ the local dialect for more familiar uses.

The history of German is paralleled more or less by the history of all the other national languages of Europe and of other parts of the world. As a result of cultural reasons of one kind or another a local dialect becomes accepted as the favored or desirable form of speech within a linguistic community that is cut up into a large number of dialects. This approved local dialect becomes the symbol of cultural values and spreads at the expense of other local forms of speech. The standardized form of speech becomes more and more set in its vocabulary, its form and eventually its pronunciation. The speakers of local dialects begin to be ashamed of their peculiar forms of speech because these have not the prestige value of the standardized language; and finally the illusion is created of a primary language, belonging to the large area which is the territory of a nation or nationality, and of the many local forms of speech as uncultured or degenerated variants of the primary norm. As is well known, these variations from the norm are sometimes much more archaic, historically speaking, than the norm from which they are supposed to depart.

Local dialects are in a sense minority languages, but the latter term should be reserved for a completely distinct form of speech that is used by a minority nationality living within the political framework of a nation. An example of such a minority language would be the

Basque of southwestern France and northern Spain or the Breton of Brittany. These languages are not dialects of French and Spanish but historically distinct languages that have come to occupy culturally secondary positions.

There is naturally no hard and fast line between a dialect and a local variation of a minor nature, such as New England English or middle western English. In the case of the older dialects the connection with the standardized speech is quite secondary, while in the case of such local variations as New England and middle western American speech standard English, however loosely defined, is present in the minds of all as the natural background for these variations, which are thus psychologically, if not altogether historically, variations from the primary or standard norm. It would be possible for the speaker of a local Swiss dialect or of Yorkshire English to build up a nationalistic gospel around his local dialect in opposition to the accepted speech of the cultured group, but the attempt to do this for middle western English in America would have something intrinsically absurd about it because of the feeling that this form of English is at best but a belated departure from an earlier norm. As usual in social phenomena, however, it is the symbolism of attitude that counts in these matters rather than the objective facts of history.

Ever since the formation of the great national languages of Europe toward the end of the mediaeval period there have been many social and political influences at work to imperil the status of the local dialects. As the power of the sovereign grew, the language of the court gained in prestige and tended to diffuse through all the ramifications of the official world. Meanwhile, although the Roman Catholic and Greek churches with their sacred liturgical languages were little interested in the question of folk versus standardized speech, the Protestant sects with their concern for a more direct relation between God and His worshipers emphasized the dignity of folk speech and lent their aid to the diffusion of a selected form of folk speech over a larger area. The influence of such documents as Luther's Bible and King James' authorized version in the standardization of German and English has often been referred to. In more recent days the increase of popular education and the growing demand for ready intelligibility in the business world have given a tremendous impetus to the spread of standardized forms of speech.

In spite of all these standardizing influences, however, local dialects, particularly in Europe, have persisted with a vitality that is little short of amazing. Obviously the question of the conservatism of dialect is not altogether a negative matter of the inertia of speech and of the failure of overriding cultural influences to permeate into all corners of a given territory. It is to a very significant degree a positive matter of the resistance of the local dialects to something which is vaguely felt as hostile. This is easily understood if we look upon languages and dialects not as intrinsically good or bad forms of speech but as symbols of social attitudes. Before the growth of modern industrialism culture tended to be intensely local in character in spite of the uniformizing influences of government, religion, education and business. The culture that gradually seeped in from the great urban centers was felt as something alien and superficial in spite of the prestige that unavoidably attached to it. The home speech was associated with kinship ties and with the earliest emotional experiences of the individual. Hence the learning of a standardized language could hardly seem natural except in the few centers in which the higher culture seemed properly at home, and even in these there generally developed a hiatus between the standardized language of the cultured classes and the folk speech of the local residents. Hence cockney is as far removed psychologically from standard British English as is a peasant dialect of Yorkshire or Devon. On the continent of Europe, particularly in Germany and Italy, the culture represented, for example, by standardized German or standardized Italian was until very recent days an exceedingly thin psychological structure, and its official speech could hardly take on the task of adequately symbolizing the highly differentiated folk cultures of German speaking and Italian speaking regions.

The Age of Enlightenment in the eighteenth century was, on the whole, hostile to the persistence of dialects, but the romantic movement which followed it gave to folk speech a glamour which has probably had something to do with the idealization of localized languages as symbols of national solidarity and territorial integrity. Few writers of the seventeenth and eighteenth centuries would have taken seriously the use of dialect in literature. It was only later that Lowland Scotch could be romantically restored in the lyrics of Robert Burns, that Fritz Reuter could strive to establish a Low

German (Plattdeutsch) literary language and that Mistral could attempt to revive the long lost glory of Provençal. One may suspect that this renewed emphasis on linguistic differences is but a passing phase in the history of modern man. Be that as it may, it has had much to do with the emergence of new nationalisms in recent times. It is doubtful if such countries as Lithuania, Estonia and Czechoslovakia could have so easily proved their right to exist if it had not come to be felt that just as every nationality needs its language, so every unattached language needs its nationality and territorial independence to fulfil its inherent mission. Perhaps the best example of what might be called linguistic romanticism is the attempt of the Irish nationalists to renew the vitality of Gaelic, a form of speech which has never been standardized for literary, let alone folk, purposes and which is profoundly alien to the majority of the more articulate of Irish nationalists.

No doubt the respect for local forms of speech has received assistance from scientific linguistics and its tendency to view all languages and dialects as of equal historical importance. It is very doubtful, however, if linguistic localism can win out in the long run. The modern mind is increasingly realistic and pragmatic in the world of action and conceptualistic or normative in the world of thought. Both of these attitudes are intrinsically hostile to linguistic localism of any sort and necessarily therefore to dialectic conservatism. Compulsory education, compulsory military service, modern means of communication and urbanization are some of the more obvious factors in the spread of these attitudes, which, so far as language is concerned, may be defined by the thesis that words should either lead to unambiguous action among the members of as large a group as is held together culturally or in the domain of thought should aim to attach themselves to concepts which are less and less purely local in their application. In the long run therefore it seems fairly safe to hazard the guess that such movements as the Gaelic revival in Ireland and the attempt to save as many minority languages and dialects from cultural extinction as possible will come to be looked upon as little more than eddies in the more powerful stream of standardization of speech that set in at the close of the mediaeval period. The modern problem is more complex than the classical or the mediaeval problem, because the modern mind

insists on having the process of standardization take the form of a democratic rather than an aristocratic process.

A word may be added in regard to the social psychology of dialectic forms of speech. In the main, markedly dialectic peculiarities have been looked upon as symbols of inferiority of status, but if local sentiment is strongly marked and if the significance of the local group for the larger life of the nation as a whole allows, a local dialect may become the symbol of a kind of inverted pride. We thus have the singular spectacle of Lowland Scotch as an approved and beautiful linguistic instrument and of cockney as an undesirable and ugly one. These judgments are extrinsic to the facts of language themselves but they are none the less decisive in the world of cultural symbolisms.

If an individual is brought up in a community that has its characteristic dialect and if he becomes identified later in life with another community which has a second mode of speech, some very interesting personality problems arise which involve the status symbolism or affectional symbolism of these differing forms of speech. Individuals who vacillate somewhat in their conception of their own role in society may often be detected unconsciously betraying this feeling of insecurity in a vacillating pronunciation or intonation or choice of words. When under the influence of an emotional crisis such individuals are thrown back upon their earliest emotional experiences—"regress," in short—they are likely to relapse into early dialectic habits of speech. It is suggested that the question of the relation of the individual to the various dialects and languages to which he has been subjected from time to time is of far more than anecdotal interest, that it constitutes as a matter of fact a very important approach to the problem of personality subjected to the strains of cultural change.

DIAMAND, HERMAN (1860–1931), Polish socialist. Diamand was born of Jewish parents in Lwów and studied law and economics at the universities of Lwów, Vienna and Czernowitz.

After a brief period of activity in the Zionist movement Diamand transferred his sympathies and allegiance from the cause of Jewish nationalism to that of international socialism. He was the cofounder of the Polish socialist organization of Galicia in the 1880's and for over fifty years was the leading spirit of the Polish Socialist party. During the last few years of his life he was chairman of its executive council. His entrance into the Austrian parliament in the election of 1907—the first Austrian election based on universal franchise—opened to Diamand a brilliant and uninterrupted period of parliamentary activity, first in the Reichsrat of Vienna and following the disruption of the Austro-Hungarian Empire in the Sejm in Warsaw. In both legislatures he occupied a prominent position as a leader of the Polish Socialist party and as a member of the commission on budget and finance. He was particularly valued for his expert knowledge in matters of finance and industry and was delegated by the Polish government to negotiate the commercial treaty with Germany.

Diamand's activities extended beyond the boundaries of Poland. He represented Polish socialism in the International Socialist Bureau prior to the World War; with Daszynski he pleaded the cause of the reestablishment and unification of Poland at the socialist peace conference in Stockholm in 1917; he represented the Polish Socialist party on the Executive of the Labor and Socialist International from its inception in 1923. He was a brilliant orator, contributed frequently to the leading socialist papers at home and abroad and was the author of several pamphlets on the economic position of Galicia.

N. REICH

DIASPORA is a Greek term for a nation or part of a nation separated from its own state or territory and dispersed among other nations but preserving its national culture. In a sense Magna Graecia constituted a Greek diaspora in the ancient Roman Empire, and a typical case of diaspora is presented by the Armenians, many of whom have voluntarily lived outside their small national territory for centuries. Generally, however, the term is used with reference to those parts of the Jewish people residing outside Palestine. It was used at first to describe the sections of Jewry scattered in the ancient Greco-Roman world and later to designate Jewish dispersion throughout the world in the 2500

years since the Babylonian captivity. Diaspora has its equivalents in the Hebrew words *galuth* (exile) and *golah* (the exiled), which, since the Babylonian captivity, have been used to describe the dispersion of Jewry.

While the origin of the Diaspora was largely due to repeated mass deportation or exile (e.g. at the hands of Babylonian and Roman conquerors), the emigration of economically depressed groups, the settlement abroad of traders and similar trends helped create Diaspora communities. Similarly, the progressive shifting of the Diaspora is not solely explicable in terms of orders of expulsion, massacres and like incidents. The Diaspora moved and broadened not only because of pressure from behind but also because of such pulls as were exerted by regions which seemed to offer better economic opportunity or increased liberty and security. The nature of Jewish emigration and wanderings is not peculiar in itself. It is the persistence of the Jewish people as a recognizable group through centuries of such wanderings in countries where they constituted a compact minority, which never enjoyed the powerful and dependable protection or support either of a homeland or of any foreign ally, that makes the Jewish Diaspora a rare and significant phenomenon.

The history of the Jewish Diaspora may be divided into two periods, the eastern and the western. The eastern Diaspora developed while a center continued to exist in Palestine, which was either an independent state or an autonomous province within the great near and middle eastern empires. Under the Persian monarchy of the Achaemenidae (558–330 B.C.) a small restored Judea found itself between two Diaspora centers, Babylon and Egypt, where (as shown by the books of *Ezra* and *Nehemiah*, by documents discovered in Babylonian Nippur by the American expedition of 1893, and by the Elephantine papyri discovered in 1906) exiled Jews founded large colonies which maintained a constant connection with the metropolis, Jerusalem. The spread of the Jewish Diaspora was particularly favored by Greek eastward expansion beginning under Alexander and Roman expansion after the Punic wars. In the third and second centuries B.C. Judea found itself between two Hellenistic states: the Ptolemaic kingdom in Egypt and that of the Seleucidae in Mesopotamia, Syria and Asia Minor. Jerusalem was closely tied to the important Jewish colonies in Alexandria and the Syrian Antioch,

capitals of the two dynasties which, in turn, ruled Judea. The stream of the Diaspora spread with increasing force toward the Nile and even more toward the Euphrates. The liberation of Judea from the Seleucidae and the formation of an independent Hasmonaeon state (142–63 B.C.) did not stop the growth of the Diaspora, and the substitution in the East of Roman for Greek authority (middle of the first century B.C.) still further increased its area. Hardly a town in Mediterranean Asia and Africa was without a considerable Jewish population, according to Strabo (see Josephus, *Antiquities*, xiv: 7, 2), Josephus and Philo of Alexandria (*In Flaccum*, 7). Jewish colonies were scattered not only through all the eastern territories of the Roman Empire but also outside its frontiers in Parthian Mesopotamia and Persia. Jewish communities everywhere enjoyed autonomy in internal affairs. When local populations (e.g. the Greeks in Syria and Asia Minor) attempted to interfere with their rights of self-government, the Jews appealed to the imperial authorities in Rome; both Julius Caesar and Augustus restored Jewish autonomy in these provinces (*Antiquities*, xiv: 10; xvi: 6). The Jews of Alexandria had a chief (*ethnarches*), their own tax inspector (*alabarches*) and, according to Strabo, formed a separate state unit (*politeia*). Each Jewish community had an archon and a council of elders (*gerousia*). The Diaspora Jews exceeded in number those of Judea; according to Philo about one million lived in Alexandria and its vicinity alone. At this time the Mishnah already distinguished between “laws connected with the country” (Judea) and those applying *chutz la-aretz*, or outside the country.

As long as Jerusalem maintained its position as the capital of Judea, the Diaspora acknowledged its spiritual hegemony. Pilgrims from Asia and Africa flocked to it for the great annual festivals, and the Diaspora communities were taxed for the support of the Jerusalem Temple. Even after the fall of Jerusalem in 70 A.D. and the cessation of worship at the Temple the Diaspora for a time accepted the orders of the Sanhedrin at Jabneh in Judea and of the patriarchs in Galilee. But after the suppression of the Bar-Kochba uprising in 135 A.D. and the stiffening of Roman oppression in Palestine, the hegemony of Palestinian Jewry was challenged by the Jews of Babylon, particularly of the lands under Parthian and Persian domination, where the exilarchs, or *resh-galutha* (leaders of the Diaspora), assumed the position formerly

held by the patriarchs of Palestine. After Christianity became the state religion of the Roman Empire and after the patriarchate in Palestine (315-425 A.D.) had declined, national hegemony passed completely to the Babylonian center with its influential Talmudic academies, which about 500 A.D. fixed the oral tradition in an immense literary monument, the Babylonian Talmud. In the Arabian caliphate, which included the whole of the eastern Diaspora together with Palestine (from the seventh to the eleventh centuries), all Jewry recognized the hegemony of the Babylonian community. The *geonim*, heads of the Talmudic academies in Sura and Pumbeditha, interpreted religious and legal questions for individuals and communities everywhere. A flourishing international trade in the countries of the caliphate in which Jews were active contributed to the unification of the Diaspora around Babylon, center of the Bagdad caliphate. The breakdown of the caliphate in the eleventh century ended the hegemony of the Babylonian center, and the crusaders struck the last blow at the Jewish center in Palestine.

The western or European Diaspora came into being shortly before the Christian era at the time of Roman expansion into central Europe. A Jewish colony existed in Rome itself as early as the capture of Jerusalem by Pompey and inspired apprehensions in the conservative Cicero (*Pro Flacco*, § 28). Roman Jewry began to intervene in Judean affairs in the time of Herod I and his successors. In the days of the apostle Paul, Jewish communities (synagogues) existed in Corinth, Thessalonica and other Greek cities. Jews settled in the Greek colonies on the north shore of the Black Sea, where Jewish synagogues are referred to in inscriptions as early as 80 A.D. Memorial tablets in Roman catacombs and many Italian cemeteries indicate the steady growth of Jewish communities in the first centuries of the Christian era. Beginning with the fourth century Jewish immigration into central Europe proceeded from both Italy and Byzantium. The great migrations scattered the Jews through Germany, Gaul and Spain. The religious fanaticism of the Spanish Visigoths threw the persecuted Jews into the arms of the Arabian conquerors in 711, and Arabic Spain became for several centuries one of the largest centers of western Jewry. Simultaneously Jewish communities grew in the empire of Charlemagne and the states which evolved from it, Germany and France. International trade linked western Jewish colonies

to the old eastern centers, but national hegemony was shifting westward. After the fall of the exilarchs and *geonim* in Babylon in the eleventh century it rested with the Jews of the caliphate of Cordova and the states of Granada, Seville and Saragossa, which developed from it. There Jews became important statesmen and leaders of an Arabo-Jewish literary renaissance. At the same time there arose in France and Germany Jewish centers, upon which the first three crusades inflicted heavy material losses without affecting their spiritual leadership. Persecutions served to segregate the Jews in special quarters of cities (*Judenstadt*, *juiverie* and, later, ghetto). They developed separate autonomous communities with their own indigenous cultures embodying Jewish national traditions. The mediaeval fanaticism of the church, coupled with the economic struggle, resulted in the expulsion of the Jews from England in 1290 and from France in 1394, but left intact the large settlements in Italy, Christian Spain and Germany, those of the latter two countries sharing Jewish national hegemony. At the end of the Middle Ages the expulsion of the Jews from Spain and Portugal from 1492 to 1498 dealt a death blow to the Iberian center, and persecutions weakened German Jewry. The western Diaspora turned eastward: the Spanish exiles (*Sephardim*) migrated en masse to European Turkey, many oppressed German Jews (*Ashkenazim*) to Poland.

Beginning with the sixteenth century national hegemony was exercised by the Jews of Germany and Poland. The prosperity of the Jews of Poland, where broad autonomy was granted by the state, led to a remarkable increase in numbers: about one half of European Jewry became concentrated here. The Ukrainian massacre of the mid-seventeenth century and political reaction affected unfavorably the position of Polish Jewry, but the natural increase of the patriarchal Jewish family was so great as to exceed many times the loss in population resulting from massacres and emigrations. At the end of the eighteenth century, following the partition of Poland, one million Jews were found in the Russian Empire; a century later there were six millions. In the nineteenth century the largest part of the Diaspora was concentrated in eastern Europe.

By the end of the century the situation had materially altered. Pogroms and legal disabilities in czarist Russia, beginning in 1881, forced out tens of thousands of Jewish immigrants

annually, of whom the majority went to the United States. Similar migrations from other parts of eastern Europe went on until the American Jewish colony had grown from 250,000 in 1881 to about 4,000,000 half a century later. Expansion also occurred into Canada, South Africa, Australia, Argentina and Brazil. By the twentieth century the Diaspora had spread to all quarters of the globe. At the end of the nineteenth century a small current of migration to Palestine became noticeable; since 1914 the Jewish population of Palestine has increased by only 90,000, making a total of 170,000. This partial return, while of little importance to Jewry's general situation in the Diaspora, may have symbolic meaning in the revival of the ideological dualism of Zion and *galuth*.

The Diaspora has left a deep imprint on all aspects of Jewish life. Aside from the fact that the law of Christian countries until recently prohibited Jews from owning land or leasing it except for short terms, a people scattered among various nations and with constant expectation of new compulsion to migrate could not engage to a great extent in agriculture, which fixed men to the soil. Jews needed a portative economics of handicraft and commerce, assets convertible at short notice should they be forced to move suddenly to a new place of settlement. During the centuries of persecution and expulsions many were engaged in money lending, especially the making of small short term loans.

In the social and political spheres Diaspora life created, as substitutes for state forms, autonomous communities controlling not only religious life but social relations in the broad sense of the term: education, social welfare, external relations (with the state authorities) and so on. In most of the eastern Diaspora the state delegated to such communities wide powers of regulation, taxation, judicial administration (including punishment of crime) and the like. Even in modern Europe the Jewish *kehilla* (communal organization—the *Kultusgemeinde* of German states, the *consistoire* of more limited authority in France) has continued as an arm of the state. Where, as in the United States, national or cultural minorities are largely ignored by the state officially, Jewish communities still carry on some public functions.

In many countries the Jews created vernaculars, mixtures of the local language with Hebraic words, and retained the Hebrew script. Such are the so-called jargons: Judeo-Spanish (La-

dino or Spaniolit) and Judeo-German (Yiddish), the latter still the spoken and literary language of millions of Jews in eastern Europe and of not a few in America. Jewish political emancipation, which began with the French Revolution, changed the character of the relations between parts of the Diaspora and the states which gave them shelter. As long as Jews were considered by Christian states as foreigners or made to suffer from legal disabilities as a caste, they kept apart and felt themselves to be citizens only within the limits of their own communities. With the emancipation, however, they began to be active in the cultural, political and social life of the country as a whole and to assimilate with the general population, even to the extent of intermarriage. There arose divergent views among Jews: some favored assimilation, looking upon themselves as merely a religious group, and others (nationalists) emphasized their ties with the world Diaspora as an interterritorial nation and demanded national minority rights in countries where Jews form compact groups.

The Jewish Diaspora has always exercised considerable influence upon the cultures with which it has come into contact. The influence of Judaism on the growth of Christianity in the ancient world and the part played subsequently by scattered Jewry in European religious evolution are well known. The syncretism of Jewish and Hellenistic thought and the Jewish-Arabic mediaeval renaissance were creations of the Diaspora which played important roles in European cultural history. In addition the Diaspora had an important influence upon world economic development. The continuous relations maintained between its various parts made it a powerful factor in international trade. In the ancient world this role was played by Jews and Greeks, in the Middle Ages by Jews, Venetians and Genoans, in modern times by Jews and the colonial empires. Jews have played a major role in organizing modern credit and establishing the use of promissory notes, stock exchanges and banks. On the other hand, many Jewish elements have become connected with the modern socialist movement. The contributions of the Diaspora to the development of international capitalism and socialism are among the effects of which antisemites complain. The Diaspora, always a cultural ferment and a force for progress, has provoked the enmity of conservative and reactionary elements, which seek support in religious and national fanaticism. Hence the warnings of the mediaeval church

against the danger of Judaism to the Christian world and the protests of modern antisemitism against the "international Jew."

Among the Jews themselves there is no unanimous estimate of the Diaspora. From the religious point of view it has always been considered as a punishment of God. The hope of a return to Zion with the coming of the Messiah has always lived in the heart of the orthodox Jew and was one of the thirteen articles of faith of the Jewish religion as drawn up by Maimonides. In the course of twenty centuries of expectation repeated Messianic movements for a return to Zion, colored by political and mystical influences, have arisen, all ending in disappointment and resignation. In moments of resignation Jews consoled themselves with the thought that the Diaspora was not God's curse but a benefit; and Rashi, a mediaeval commentator, in interpreting this statement in the Talmud, explained that it is a benefit because a scattered people cannot be all destroyed at the same time (*Pesachim*, 87b). Another scholar declared that God did not "scatter" the Jews but has sown them among the nations like seeds from which will grow the true world religion of monotheism. This twofold attitude toward the Diaspora is paralleled in modern Reform or Jewish religious liberalism. The reformers deny the Messianic dogma and regard the spreading of the ethical monotheism of the Jewish prophets through the Diaspora as Jewry's mission, for the sake of which they are willing to accept national assimilation. The Zionists, who have revived the Messianic dogma in modernized political form, declare that Jewry in the Diaspora is doomed to national extermination through assimilation and that those who cannot or do not want to assimilate must create the *Judenstaat*, or national home in Palestine. This "rejection of Galuth" is criticized by a third group, the Diaspora nationalists, who contend that the Diaspora has survived for twenty-five centuries not only because of religious unity but also because it always preserved national autonomy in cultural institutions, organized communities and unions of communities and will continue to do so by adapting itself to new political and cultural conditions. At the end of the World War a new formula for the settlement of national problems in general was proposed: in countries of heterogeneous population the right of national minorities to cultural autonomy was officially recognized by international treaties and guaranteed by the

League of Nations. Jewish national groups in several countries have partly obtained such recognition. Even Zionists begin to accept Diaspora nationalism when they accept the fact that a large Diaspora must continue to exist side by side with the small national center which may develop in Palestine.

DÍAZ, JOSÉ DE LA CRUZ PORFIRIO (1830-1915), Mexican soldier and statesman. Like many ambitious Mexican youths without wealth he was educated for the church, but at the first opportunity he turned to the study of law and politics. Since the army, however, was the surest avenue to political power in Mexico he soon concentrated his attention upon military

affairs. Between 1847 and 1877 he participated in three wars, playing a prominent role in that against Emperor Maximilian. His ambition grew with his military successes, and the military uprisings of 1871 and 1876, which he led, ostensibly against foreign capital and the principle of non-reelection of presidents, were intended to further his political aspirations. In 1877 he became president.

As the Mexican constitution forbade the president to succeed himself, he deemed it wise to transmit the presidency to Manuel González in 1880. Díaz succeeded him in 1884 and maintained himself in power continuously until 1911. His regime began at a time when a successful war for national integrity and a partially successful struggle for social reform had left Mexico prostrate and virtually bankrupt. In order to further material development he unfortunately turned the nation aside from the path of democratic evolution. Aided by a few able administrators he ruled the Mexican people with an iron hand, eliminated banditry and inaugurated a stable regime which invited foreign capital, particularly from the United States. Railways and telegraph lines were built and the rich natural resources of the country rapidly exploited. The foreign trade of Mexico increased from \$64,000,000 in 1885 to \$238,000,000 in 1907. But the foreigners failed to become Mexican citizens and took most of their money away, leaving only a small residue in taxes, higher wages and profits to a small group of Mexicans in return for concessions and political influence. Although Díaz gave comparatively little attention to the education of the masses, material progress brought some enlightenment, but the presence of prosperity aroused envy among the mixed classes who had little share in its benefits. Moreover, the Indians whom the dictator allowed to be dispossessed of their communal lands became restless. In 1911 the Madero revolution compelled Díaz to resign and go into exile.

DICEY, ALBERT VENN (1835-1922), English jurist and political scientist. Dicey was graduated with first class classical honors from

Balliol College, Oxford, in 1858 and in 1860 won the Arnold Historical Prize for an essay on *The Privy Council* (Oxford 1860, 2nd ed. London 1887). He was admitted to the Inner Temple in 1863 and became counsel in the Inland Revenue in 1876. From 1882 to 1909 he was Vinerian professor of the common law at Oxford, where his services were notable in stimulating in every way the study of law. He was one of the Oxford group of professors who in 1884 established the *Law Quarterly Review*, to which he frequently contributed.

Dicey was influential chiefly through his writings. His treatise *A Digest of the Law of England with Reference to the Conflict of Laws* (London 1896; 4th ed. by A. B. Keith, 1927) remains an authoritative work on this subject. He will probably be particularly remembered, however, for his *Introduction to the Study of the Law of the Constitution* (London 1885, 8th ed. 1915) and his *Lectures on the Relation between Law and Public Opinion . . .* (London 1905, 2nd ed. 1914), both of which grew out of courses of lectures to students. In the former he gave classic form to the orthodox theory of English constitutional law. Employing the analytic method of Austinian jurisprudence at its best he clearly developed the principles of parliamentary sovereignty and the rule of law as contrasted with the constitutions and administrative law of European countries. He was the first legal scholar to clarify the relationship between constitutional law and the conventions of the constitutions upon which the cabinet system depends. In the later editions of this important work he considerably modified his earlier severe strictures on the continental system of administrative law but nevertheless seriously deprecated the growth of administrative law and administrative tribunals in England. Probably Dicey's most important work was his *Law and Public Opinion*. In it he traced in masterful fashion the influence of early nineteenth century individualistic sentiment upon the legislation of that period and upon the subsequent collectivist trend in opinion and in the positive law which has been increasingly evident since that time. His historical survey is greatly illuminated by chapters upon the relation between law and public opinion. Dicey was also the author of *A Treatise on the Rules for the Selection of the Parties to an Action* (London 1870, 2nd American ed. Jersey City 1886) and of *The Law of Domicil as a Branch of the Law of England* (London 1879).

His later years were largely occupied with polemical discussions of current political questions, which appeared in the English reviews, chiefly the *Nineteenth Century*. He was strongly opposed to home rule and was generally out of sympathy with the newer tendencies in English politics.

DICKENS, CHARLES (1812-70), English novelist and publicist. Scenes and people and conditions of squalor were embedded in Dickens' memory when during his childhood his family suffered a period of misfortune, and these experiences gave intensity to the hatred of oppression and the interest in human beings which are apparent in all his writings. The framework of contemporary English society determined the direction of Dickens' sympathies. The industrial revolution with its rapid economic change and its accompanying social disorganization was creating a new and bewildering England. Living and working conditions, education, legal protection, state provisions for welfare, even the consolations of religion, were still confronting the problems of industrialism with a feudal technique. The resultant misery was for Dickens not a problem to be analyzed but a grievous injustice to be palliated as quickly as possible. In a series of vivid and powerful novels which commanded a large, intent and sympathetic audience he awakened and directed the humanitarian consciousness of his day to the most glaring evils, with an effectiveness that would have been impossible to a professional reformer. As editor of several magazines, notably *Household Words*, he was also able to project his convictions through the medium of journalism.

Dickens' depiction of the injustice and degradation of imprisonment for debt was largely instrumental in its eventual abolition. Rapid urbanization and the impoverishment of the countryside were both characteristic of the period, and Dickens' revelation of the wretched housing conditions—the squalor of the slums and the inadequacy of homes in rural districts—bore tangible results in the Association for Improving the Dwellings of the Poor and in the first housing

acts. He ridiculed bureaucracy in government and he called attention to the human consequences of cumbersome, absurd and slow moving legal processes, particularly as they involved the poorer classes. He was one of the first to denounce the customary neglect and oppression of children, their organized training in crime, the cruelty and stupidity of the treatment of juvenile delinquency, the wretched provisions made for education. By wakening the public to a realization of the rights of children he opened the way for far reaching reforms which had hitherto been unsupported or undreamed of—the Reformatory School Act of 1854, the work of Lord Shaftesbury in behalf of street urchins, the Ragged School Union, the discrediting of corporal punishment in schools, the abolition of forced and artificial methods of education, the establishment of free schools for the poor. Dickens was an active supporter of the work of Froebel and the kindergarten movement, and he made a strong plea for the value of sympathy and imagination in the teaching of children.

Dickens' novels reflect the values and limitations of his period with an exactitude that is possible only in a writer who is wholly of his own time. He was not a mere conformer—in many respects he was considered even a radical—but his philosophy and his radicalism were confined strictly to the Victorian mold of propriety and restraint. Neither his traditions nor his sympathies were of the masses; even his most scathing indictments were dictated by the social passion of a bourgeois. His novels present a perfect picture of the life and temper of Victorian England, a better picture for the very reason that his conformity with his age was implicit and unconscious. It is largely this orthodoxy to Victorian humanitarianism that makes possible the charge that as a social reformer Dickens saw only the necessity of remedying superficial abuses, that he did not go to the root of the evils he abhorred, that he understood little of economic processes and that he shared the "dry-as-dust" conception of the social sciences. Yet, on the other hand, Dickens removed himself from the immediate issues of time and place by insisting primarily on that sympathy and intelligence in social relationships which are essential to any program of improvement.

DICKINSON, JOHN (1732-1809), American political writer and statesman. Dickinson was born in Maryland of a wealthy Quaker family. He was educated privately and then studied law in Philadelphia and in the Middle Temple in London. After practising for several years in Philadelphia he was elected to the Delaware Assembly in 1760 and two years later to the Pennsylvania Assembly. He was a delegate to the Stamp Act Congress in 1765, a member of the Continental Congress from 1774 to 1776 and of the Congress for four years during the revolution. He was president of the Delaware Supreme Council in 1781-82 and of the Pennsylvania from 1782 to 1785, chairman of the Annapolis Convention in 1786 and delegate to the Federal Convention in 1787.

Dickinson is frequently referred to by the title Tyler bestowed on him, "the Penman of the Revolution," for he played an important part in drafting several of the important constitutional documents adopted by the various congresses and conventions. It would, however, be more accurate to call him the penman of the early period of constitutional resistance to the taxing power of Parliament. The best known and most important of his writings is the series which appeared in the *Pennsylvania Chronicle* in 1767 and 1768 under the title, "Letters from a Farmer in Pennsylvania to the Inhabitants of the British Colonies." No essays except Paine's *Common Sense* (1776) equaled these in popularity both at home and abroad. They were directed against the Townshend acts and in particular against the principle that the British Parliament could levy revenue duties upon the colonies without their consent. Their argument is substantially the same as that advanced in Parliament by Pitt, Burke and Camden. Dickinson had relatively little to do with developing the final or dominion status principle of constitutional resistance. He opposed the revolutionary attitude, voted against the adoption of the Declaration of Independence in 1776, and although he almost immediately enlisted as a private in the army he suffered a great loss of popularity which he never entirely regained. Of his other writings the most important are the two series of letters signed "Fabius" in the first of which he advocated the ratification of the

constitution of 1788 and in the second defended the French alliance in 1797.

DICTATORSHIP is a term which has undergone notable change in meaning. In the constitution of the Roman Republic it signified the temporary possession by one man of unlimited power, a trusteeship regarded as necessary to enable the state to weather a crisis. While ordinarily executive power was shared by two consuls, there was a constitutional provision that undivided power, essentially that of a king, might be restored in case of dire need, such as invasion, civil strife or administrative deadlock. The office was bestowed in solemn, legal fashion—the auspices were taken in the dead of night, the senate ordering, the consul appointing. But as significant as the absoluteness of the Roman dictatorship was the fact that it was temporary. When the task was performed, the power ended: when the Aequian enemy was disposed of, Cincinnatus returned to the plow. Of the eighty-eight dictatorships between 501 B.C. and the decline of the institution three centuries later, most were for a very short period, six months at the longest. At the expiry of the office an accounting of the stewardship had to be given. Responsibility to the governed and to the law was thus essential. When Caesar, repeating a practise of Sulla, held "dictatorial" office that was manifestly irresponsible and of indefinite duration, it was a sign that the republican constitution was breaking down. After the assassination of Caesar, Antony moved and the senate passed a law abolishing the dictatorship. Augustus carefully avoided the title of dictator but he did so mainly because it had a connotation of the temporary; permanence of power was as important to him as absolutism.

In modern times there have been numerous instances of absolutism, sometimes benevolent and acceptable, sometimes harsh and deserving the name of despotism or even tyranny. But the concept of dictatorship has until recently been kept separate and history has used it to desig-

nate an emergency assumption of power, such as that by the French Committee of Public Safety in 1793 and by General Cavaignac during a few months of 1848. The position of Cromwell would seem to be similar, although his eulogist, Carlyle, characterized it euphemistically as a directorate. To escape from civil war England had to put herself temporarily in the absolute power of her one great man.

In the decade following the World War, however, there was a widespread tendency to use the term dictatorship as synonymous with absolutism or autocracy. In the true dictatorship the suspension of some constitutional features has in the past had as its aim the saving of the constitution as a whole. But in the post-war dictatorships constitutional government was ignored or encroached upon in the interest of an ambitious hero or a privileged class, with little evidence of popular consent save men's unwillingness to resist machine gun and police agent. Parliaments were abolished or toyed with, guaranteed private and public rights were nullified, all governmental powers heaped upon a *duce*. There is much variety, and yet there is something in common, in the figures of Mussolini in Italy, Primo de Rivera in Spain, Pilsudski in Poland, Mustafa Kemal in Turkey, Carmona in Portugal, Valdemaras in Lithuania, Pangalos in Greece, Zhivkovitch in Yugoslavia, Riza in Persia, Tsankoff in Bulgaria, Bratianu in Rumania, Bethlen in Hungary, Mahmud in Egypt. These men were widely called dictators, but their recognized superiority to ordinary constitutional rules was not limited to specific tasks or periods; it aspired to permanence. No clear vision was achieved of how the constitutional regime could be eventually restored.

Dictatorship is a phenomenon of highly unstable or revolutionary conditions, such as were to be found after the World War in the countries which had been most severely affected by it. The central type of dictatorship is that which, following the classical tradition, arises in a country where this instability is a contrast to a more or less sustained period of constitutional government. Strictly considered the dictatorship, ancient or modern, is regarded as a departure from the self-governing ideal. Numerically considered, however, most of the recent instances of dictatorship fall outside this central group. Such are those to be found in the relatively immature communities (for the most part Mediterranean, Balkan, Baltic) which lack ex-

perience in bearing the difficult burden of public liberty. Still another group are the pronunciamento regimes that crop up continually in countries where instability and revolution are chronic, such as those of Caribbean America. Because of its unique character the "dictatorship of the proletariat" in Soviet Russia must be entirely excluded from these categories.

In examining the special circumstances which produce in the post-war period a people's willingness to accept a dictator where such an acceptance involves a deviation from a previous norm, it is to be noted that the strain of the war had produced lassitude in the public mind. The war had imposed military discipline, utterly diverse from conscientiously directed self-discipline. Upon its removal there was a tendency to anarchic self-indulgence, until the extremes to which it was carried rendered society ready, in necessary reaction, to endure the reimposition of military discipline by a despot. War had meant regimentation and obedience in all social activities. Concentration of authority to an extraordinary degree, as required for military purposes, accustomed men to expect public problems to be solved not by rational persuasion of the people but by decision of an arbitrary, distant authority for which one had no responsibility. These problems with which the post-war state was confronted were of unprecedented difficulty: land distribution to satisfy the peasant's age old earth hunger, currency inflation, redistribution of the tax burden because of reparation and debt, widespread unemployment, racial discrimination and pogroms, uncertain national boundaries. Demanding quick solution but incapable of it they created often an atmosphere in which revolution was possible.

In the midst of this situation the democratic process seemed to disintegrate. Even before the war there had been in some quarters an intellectual protest against democracy, at least against the parliamentary system. Gentile, Maurras, Belloc, Faguet and Mencken are instances. Democracy had been accused of postulating a popular interest in public affairs which does not exist, of failing to make room for the infallibly necessary action of the "great man," of cultivating incompetence and the evasion of responsibility. Representative institutions had been accused, on the basis of several generations' experience, of facilitating corruption. It was charged that the tendency of modern parliaments is to represent not the nation but a multitude of social fragments whose conflicting

interests cancel out, leaving a vacuum of the public mind and a paralysis that deadlocks public action. It was held that such deep social cleavages as that between bourgeois and Communist, between Fascist, Catholic and Jewish liberal, denied the very possibility of a real national consensus on anything whatsoever; no general will could be ascertained from the usual parliament with its dozens of parties; the vaunted reform of proportional representation might be more just as regards the specific partial interests but would enhance the difficulty of finding a representation of the nation as a whole among so many overemphasized representations of parts.

If democratic institutions as currently applied disable the nation from acting at all in a multi-form crisis that demands action, it is not surprising that the people accept, even welcome, the "strong man," with his boldness, his self-confidence, his readiness without debate to make decisions of some sort, even when he identifies his personal decisions with those of the nation he purports to incarnate. He brings order and settles matters not by trying to persuade or by counting majorities but by his own fiat. The mass of the people dote on one who by a mystery of magnetism inspires respect, makes them feel great through their kinship with him, their national symbol. If he has the prestige of military success they love him as the nation's savior. If he has a journalist's flair for phrase making his slogans may kindle enthusiasm in a newspaper reading age, giving him power comparable with that of the sophistical demagogue in the days of oratory. But generally speaking the dictator is one who is admired as a doer in contrast with the noisy, ineffective palaver of parliamentarians.

In such an environment what impels the individual to seek dictatorship? Motives are inextricably mixed. National service and the call of God may be discerned by seer or historian where opponents see only vulgar ambition for power or where the dictator himself is aware only of riding the storm of events and making the best adjustment possible from day to day. Characteristically the dictator is one new to power, an adventurer who has seized control through a coup d'état and who often operates behind the nominal authority of a puppet king. To gain this control blood need not be shed, if the threat of force is effective. But the continuity of law and hence its organic life are broken. The state is subjected to the new master, whose will becomes the new law. Sooner or later he

legalizes the new situation by decreeing new constitutional rules, which the people are persuaded or intimidated into ratifying by plebiscite.

The dictator need not always, however, operate from behind the constitutional power of another. He may be himself president or king or premier; he is actual dictator if his power is contrary to the tenor of the constitution. King Alfonso of Spain, tired of "rotative" alternation of party premiers who manipulate the spoils of office; King Alexander of Yugoslavia, despairing of the nation's life in the contest between Croat and Serb; King Fuad, distracted between Britain's power in Egypt and the influence of the Wafd—these are the actual wielders of dictatorial power. In such cases the power gives the appearance of residing in some general or administrator—Primo de Rivera, Berenguer, Zhivkovitch, Mahmud—who actually serves not the state or the law but the dictator king. Bethlen of Hungary and Bratianu of Rumania are names under which a narrow oligarchy by force and fraud manipulates parliamentary elections and administration in its own interest. In still other instances dictatorships have been instituted in direct imitation of the Roman plan—by a provision in the higher law. Section 48 of the Weimar constitution of 1919 in Germany makes provision for the suspension of fundamental rights in case of emergency. Likewise, as de Madariaga observes, the Spanish constitution of 1876 owes its longevity "to a provision (art. 17) which allows it to go to sleep now and then."

Dictatorship is most frequently the refuge of social groups associated with reaction. Clericalism and royalism, throne and altar, have defended their privilege by dictatorial power against encroachment by the propertyless masses. From Roman days it has been a patrician arm against plebeian claims of equality. The possessing classes—big business and landed aristocracy—find their position insecure in face of an advancing parliamentary "demagogy"; they risk the nation's constitutional life by the appeal to force. On the other hand, there are cases like that of Pilsudski, who as dictator of Poland (sometimes also minister of war or premier) since May, 1926, has generally been opposed by the parties of the Right but finds his support in Polish nationalism in its pride in a characteristic hero. With law or without it, with parliament or against it, he is sole trustee of their precarious national fortune.

The army is frequently engaged on the side of

the dictator in his struggle for power. The officer class is psychically inclined to sympathize with a regime which lives by command, not persuasion. But since the policy of the dictator may clash with army interests he provides himself with a personally loyal praetorian guard, such as the "black shirt" militia in Italy, habituated to unthinking obedience to their partisan *condottiere*. Dictators find themselves embarrassed by their followers. There are the idealists, who hope all wisdom from the omnipotent one and would lead him in the ways of their several crotchets. There are also the "arrivists," or climbers, who seek careers in a society dislocated by the war or by civil breakdown. They are all too ready to follow one who promises change and freedom from the law. Unfortunately these henchmen require reward after power is attained. Then their irregularities occasion corruption and scandal, as in the regimes of Napoleon III and Mussolini.

But the modern dictator never omits to win popular support. The people may be merely apathetic to his seizure of power, but if he is successful they will applaud. Most intellectuals will oppose him in behalf of the underlying and long run benefits of law and liberty. In order to stifle their slow but potent action in the realm of ideas he will deny freedom of speech, press, association; he may even develop secret police repression and the inhumanities of exile and confiscation. In the realms of immediate economic interest and of sentiment, however, he has the advantage over them. He can make administrative action swift, while that of a parliament is vacillating. He can satisfy the more pressing demands at once in readjusted taxation, extravagant public works, "bread and circuses," although he may thereby be storing up difficulties for himself. He hopes to improvise a remedy in time. Haussmann rebuilding Paris to be the wonder of the world for Napoleon III is imitated by Mussolini throwing out clever reminders of a grandeur that not only was but shall again be Rome. There are stunts for the headlines—the raising of Caligula's barge from Lake Nemi, polar explorations, the excavating of the Rome of Augustus, the lictor's axes—manifesting Mussolini's canny sense for the imponderables of sentiment. He strives to secure economic prosperity for the rich, jobs and wages for the poor. He is under a heavy handicap in this economic field; for here is where he chiefly needs the "common counsel" which by definition his regime rejects. He must depend on his own in-

tuition. For his omnipotence the dictator needs omniscience, but the indispensable critical advice is hard to get, and especially to accept, when one is maintained in office as the ineffable, all powerful, all knowing one. In external affairs the dictator's policy is cheap and easy nationalism. Hatred of the foreigner is something on which all classes may be united and stirred to an emotional pitch sufficient to divert them from consideration of lost liberty. Unluckily, caught as he is, the prisoner of the legend of his greatness that has been woven around him, the dictator is tempted into rash, perhaps disastrous adventures.

Dictatorial power is almost impossible to terminate except in the lawless fashion of its origin. Absolute power is as corruptive to its holders as it is oppressive to subjects. What succession can be imagined? The constitution's normal vigor has tended to atrophy during the dictatorship; the nation has been prevented from learning self-government by practise. After the dictator is gone there is the additional danger that would be successors will destroy the nation in their struggle for mastery. An Augustus, a Pepin, may transform his vast power into royalty and win a people's adoration for the Lord's Anointed, but in the nineteenth century a similar feat twice proved impossible even for a Napoleon. Yuan Shih-k'ai failed, and Mussolini, Pilsudski and the rest (with the significant exceptions of Zogu in Albania and Riza in Persia) give little sign of making any such anachronistic experiment.

DIDEROT, DENIS (1713-84), French *philosophe*. Diderot was born in Langres and was the son of a cutler. He was educated by the Jesuits and early in life came to Paris where he became a free lance journalist author. He soon joined the ranks of the *philosophes* and devoted his entire life to the spreading of liberal ideas.

Diderot was a voluminous and versatile writer and his works include treatises on philosophy and science, dialogues, letters, plays, novels, essays and art criticism. But his chief title to fame comes from his being the editor of the famous French *Encyclopédie*. This great intellectual enterprise was conceived and planned by Diderot and was carried to completion mainly through his efforts. His part was not only that of editor: he also contributed many articles on all sorts of matters from philosophy to the mechanical arts.

Diderot was the incarnation of the libertarian spirit of the eighteenth century *philosophes*. He repudiated all authority and all tradition as obstacles to free inquiry and questioned every existing institution as a violation of the natural rights of man. Convinced that religious intolerance was the chief enemy of human progress he pleaded ardently for toleration and intellectual freedom. At first a deist, he later became an experimental materialist in philosophy and an atheist in religion. Even before the appearance of Rousseau's *Contrat social* Diderot had declared that "no man had received from nature the right to govern another" and that the only legitimate source of political authority was the social contract. He was emphatically opposed to benevolent despotism, which was in such favor among his fellow *philosophes*, and advocated a parliamentary monarchy in which the representatives would be elected by the propertied classes. He also advocated the establishment of a national system of free education, including free meals and free books and even subsidies to the children of poor parents.

The personality of Diderot is as indelibly stamped on the intellectual movement of the eighteenth century as are those of Voltaire and Rousseau. But, as Faguet correctly says, "his rôle was greater than his work." As the middleman of the *encyclopédistes* Diderot exerted a powerful influence in directing the liberal thought of his day. But his own mind, free, curious, "fermentative," was incapable of sus-

tained thought in one direction. His numerous writings are suggestive and illuminating but neither their content nor their style entitles any of them to the rank of masterpieces. Diderot himself was the perfect pattern of a French *bourgeois éclairé*, rationalistic, open minded, progressive and idealistic, yet with a clear sense of property and station.

DIESTERWEG, FRIEDRICH ADOLF WILHELM (1790-1866), German educator. After studying at the universities of Herborn and Tübingen he taught for several years in secondary schools; but, influenced by the work of Pestalozzi and his disciples and by the condition of the lower classes in the industrial city of Elberfeld, he determined to devote himself to elementary education. In 1820 he was appointed director of the new normal school at Mörs. He combined a belief in individuality and the human capabilities of even the poorest child with the ideal of social solidarity. He protested against religious dogmatism and was himself a Universalist. The basis of his educational theory was the self-activity of the child and reasoning as opposed to mechanical cramming in a narrow curriculum. He advocated a state school system and liberation from church domination. Above all, he devoted himself to raising the despised craft of elementary school teaching to the dignity of a profession. His political and religious views, however, brought him into conflict with the authorities when he was director of the city normal school in Berlin from 1832 to 1847, and he was finally dismissed from his post. He continued to fight on behalf of the education of the masses, carrying his campaign into the Prussian legislature, to which he was elected in 1858. All his efforts were undone in the reaction which set in after 1848, but the spirit he aroused was kept alive by the teaching profession and bore fruit.

after 1918. Diesterweg was the founder of the *Rheinische Blätter für Erziehung und Unterricht* (1827) and of the *Pädagogisches Jahrbuch* (1851).

DIETERICI, KARL FRIEDRICH WILHELM (1790-1859), German statistician. After obtaining a thorough training in mathematics and political science, the latter under Hoffmann in Berlin, he entered government service in 1812, was geographer-engineer in the campaign of 1813-14 against France and was appointed to an office in the ministry of education in 1820. In 1834 on Hoffmann's recommendation he was appointed full professor of political science at the University of Berlin. The following year he became assistant in the bureau of statistics, of which he was made director in 1844. Three years later he was elected to membership in the Berlin Academy of Sciences.

As director of the bureau of statistics Dieterici conceived it to be a disinterested agency which should undertake the quantitative study of all phases of national life and present the results clearly, accurately and without bias. In spite of the many obstacles arising from jurisdictional disputes with other departments he succeeded in carrying out his program.

Except for enlarging and improving the regular statistical material Dieterici followed the rules laid down by Hoffmann. His chief contribution lies in the fact that he did not confine himself to mere presentation of the statistical material but subjected his data to a thorough treatment and detailed analysis and made numerous calculations and estimates with a view to bringing out the broad quantitative relationships underlying social life; he taught the reader to think in quantitative terms.

In order to assure wide dissemination of the statistical material Dieterici started in 1848 the *Mitteilungen des statistischen Bureaus*, which appeared twice a month until his death, and beginning with 1851 he published *Die Tabellen und amtlichen Nachrichten über den preussischen Staat* (10 vols., Berlin 1851-60).

As a member of the Berlin Academy of Science Dieterici contributed eleven studies, most of them in the field of demography. They are painstaking studies although they do not reveal anything new of significance to vital statistics.

RUDOLF MEERWARTH

Important works: *Der Volkswohlstand im preussischen Staat* (Berlin 1846); *Handbuch der Statistik des preussischen Staats* (Berlin 1861).

Consult: Boeckh, Richard, *Die geschichtliche Entwicklung der amtlichen Statistik des preussischen Staates* (Berlin 1863); Seibt, Gustav, "Statistik" in *Die Entwicklung der deutschen Volkswirtschaftslehre im 19. Jahrhundert*, 2 vols. (Leipzig 1908) vol. ii, pt. ii, ch. xxxvii, p. 8-11.

DIETZEL, KARL AUGUST (1829-84), German economist. His inaugural dissertation, *Das System der Staatsanleihen im Zusammenhang der Volkswirtschaft betrachtet* (Heidelberg 1855), established his position in the field of economic literature. In this book he criticized the accepted doctrine of previous nineteenth century German writers on finance, that public credit is inherently different from private credit. He maintained that pure governmental functions are as productive as the manufacture of goods and that the fixed capital necessary for them may be supplied by borrowing just as legitimately as in the latter field. Since the state itself is the greatest immaterial capital of a nation, its expenses for maintenance, replacement, salaries and current expenses should be borne as a part of the aggregate costs of production of a nation's industry. Taxation should cover these expenses, which constitute the circulating capital of government. Public loans, however, should cover the cost of

fixed government capital, which is the aggregate of public works, institutions and buildings. Since these latter expenditures are for future as well as present benefit their cost should be spread over the full period, and hence public debts impose no undue burden upon future generations. The book made a deep impression and marked a complete change in the attitude toward public credit of later nineteenth century German writers on finance. Such men as Karl Umpfenbach, Adolf Wagner, Albert Schäffle, Erwin Nasse and Georg Schanz studied his theory and carried it further. His later work, *Die Volkswirtschaft und ihr Verhältnis zu Gesellschaft und Staat* (Frankfort 1864), showing the indebtedness of Dietzel to the earlier writings of Lorenz von Stein, was less successful.

FRANZ MEISEL

DIETZGEN, JOSEPH (1828-88), German socialist philosopher. Dietzgen was born near Cologne and was a tanner by profession. He was self-educated and achieved the reputation of being the philosopher of the international working class movement. Although Marx and Engels praised Dietzgen for having independently discovered the principle of materialistic dialectics, in their private correspondence they drew invective comparisons between him and Hegel. Dietzgen's dialectical monism is an attempt to establish the historical relativity of the natural and social process; its objectivity; and the importance of human activity, conditioned by the historical environment, in both processes. Accepting the Marxian theory of historical materialism, which explains social change and class ideologies in terms of the fundamental relations of economic production, Dietzgen tries to develop it by making explicit its psychological assumptions. He elaborates a theory of cognition which stresses the continuity of human thought with the natural environment on the one hand and with the social environment on the other. This principle of continuity, which Dietzgen calls naturalistic monism, he fruitfully applies to some problems of ethics and epistemology; but as is the case in Hegel, from whom the principle of dialectical continuity is adopted, it

often leads him to a confusion between proximate and ultimate causation. Dietzgen's earliest work, *Das Wesen der menschlichen Kopfarbeit* (Hamburg 1869), is an unsystematic, obscure, yet quite suggestive fusion of behavioristic psychology, idealistic logic, biological naturalism and historical materialism. He has had comparatively little influence on socialist thought. Outstanding critics like Plekhanov and Mehring have charged him with unoriginality and inconsistency, an impression due in part to his loose terminology.

SIDNEY HOOK

Works: *Sämtliche Schriften*, ed. by Eugen Dietzgen, 3 vols. (Wiesbaden 1911). Almost all of Dietzgen's writings have been translated by Ernest Untermann in *The Positive Outcome of Philosophy* . . . (rev. ed. Chicago 1928), and by Max Beer and Theodore Rothstein in *Some of the Philosophical Essays* . . . (Chicago 1906).

DIFFUSIONISM is the name currently given several theories of the development of culture which specially emphasize the factor of diffusion.

Diffusion is the process, usually but not necessarily gradual, by which elements or systems of culture are spread; by which an invention or a new institution adopted in one place is adopted in neighboring areas and in some cases continues to be adopted in adjacent ones until it may spread over the whole earth.

Diffusion is obviously allied to tradition in that both pass culture material on from one group to another. As usually understood, however, tradition refers to the transmission of cultural content from one generation to another of the same population; diffusion, from one population to another. Tradition therefore operates essentially in terms of time, diffusion in terms of space, although the spread through space may be rapid or slow and therefore involves a time factor also.

Both tradition and diffusion are conservative factors in culture history as contrasted with the creative one of invention, which in its broadest sense is denotive of the origination of new culture material or new cultural organization. Tradition conserves material or organization through time lapses within a greater or smaller population. Diffusion conserves it from the

point of view of human culture as a whole. This aspect of diffusion has been largely under-emphasized because attention has been given to the mechanism of the spread of culture *per se* or because diffusions have been studied less from an interest in them than as a means by which historical events may be reconstructed or origins determined. Such interests are legitimate but do not exhaust the significance of diffusion. It is obvious that new cultural material which does not diffuse beyond the people among whom it originates stands little chance of permanent preservation. It is likely to perish with the particular culture to which it remains attached or even to be squeezed out of existence by new growths within this culture. Diffusion is then a process concerned with growth as well as preservation, whereas tradition as such affects only preservation. But neither in itself produces new culture content.

Diffusion and tradition also rest largely on the same psychological basis: imitation. In the case of diffusion one population imitates another at one or many points. In tradition it is one part of a population, usually the younger generation, that imitates another part. There is also a diffusion which takes place within the frame of a single culture from individual to individual, as when the leader of a fashion or propounder of a doctrine is copied by his followers or adherents. Psychologically this intracultural process of diffusion can hardly be distinguished from the intercultural one, since in last analysis all transmission must be from individual to individual. In modern anthropology interest has been largely directed to cultures rather than to the persons carrying them, so that attention has been centered on the relations between cultures or between the several parts of one culture. Diffusion as a technical and finally as a semi-popular term has as a result come to be nearly restricted to its intercultural meaning. Gabriel Tarde, however, in his *Les lois d'imitation* treated of both kinds of diffusion on the same level, which is psychologically correct; some of the earliest analyses of diffusions of wide range and long duration are given in his work.

The mechanisms of diffusion are several: migration and colonization, that is, ethnic movements; conquest; missionization; commerce; revolution; and gradual infiltration ranging from the conscious to the unconscious or infiltration which comes into social consciousness only after it is an accomplished fact. The older anthropologists and the less subtle among his-

torians have relied chiefly upon the first and grosser of these mechanisms. Ethnologists, archaeologists and culture historians, on the other hand, recognizing more and more that these simple mechanisms are inadequate to explain the phenomena they are confronting, have increasingly discerned the importance of infiltration and have tended to emphasize it as in the long run the most important phase of diffusion. They seem to have shown that the main streams of culture permeation often run surprisingly independent of migrations and political and military events. In extreme instances this has led to an underemphasis upon these more obvious factors or even to impatience at their recognition. They can indeed be disturbing elements in the task of unraveling the full story of cultural events, which is normally both intricate and largely below the level of historic consciousness.

Both the culture area (*q.v.*) and the age-and-area concepts presuppose and rest upon diffusion, mainly of the infiltrating kind and as a normal process. But however normal the tendency of culture material to diffuse, it is clear that the actual spread of such material has not gone on irresistibly nor in any mechanically calculable manner, else all but extremely remote populations would long since have assimilated to nearly the same culture. Among the checks or limitations to diffusion—other than the self-evident ones of lack or scantiness of communications—are the factors of resistance and displacement. Resistance is due to the presence in the recipient cultures of material and systems which are, or are felt to be, irreconcilable with the invading traits or system and therefore tend to block them, checking their farther diffusion. Frequently it is the presence of cultural habits functionally analogous to the new elements which results in a block. Coffee is unlikely to invade rapidly or successfully a nation addicted to tea drinking. Christianity and Islam, which are both monotheistic, Messianic and scriptural, have diffused into the territory of each other very much less, except by violence, than they have diffused into countries of a different type of religion. Sometimes the factors that defeat or facilitate diffusion are far more subtle or intricate than in these examples and yet are at least approximately determinable.

Displacement affects not the process of diffusion but its results. If representative government gains at the expense of monarchy, the distribution of the latter shrinks and the prod-

ucts of an earlier diffusion of the idea of kingship begin to be obliterated, until perhaps the institution remains only in scattered survivals. From such territorially discrete survivals the history of the growth and decay, or diffusion and shrinkage, of monarchy could perhaps be inferred even in the absence of documentary data, as among primitive or non-literary peoples. On the other hand, such sporadic occurrences might theoretically also be due to wholly independent origins, to parallel inventions of kingship. Convergent processes may also be the cause. Monarchy may arise in one place as a product of military defense, in another theocratically, and yet the two institutions may assimilate quite closely, although independently, with the lapse of time. It is even possible that each might then undergo diffusion until they met, and their coalesced areas would then look as if they were the result of a single origin and diffusion. Considerations of this sort make the unraveling of historically undocumented culture data a difficult and delicate task, calling for intensive knowledge, reliable analysis and a critically conservative judgment. Most of the controversies of anthropology have revolved about problems of precisely this order. The diffusionist schools, in the opinion of the others, have tried to hack their way through this intricate Gordian knot.

On the other hand, the diffusionists have developed more clearly than before the important concept of degeneration, not only of whole cultures but of culture elements, and have provided some extremely suggestive examples. Their tendency has been to operate almost exclusively with rare and unique inventions and very widespread diffusions, tempered at need with degenerations. But this oversimplification of mechanisms should not lead to overdistrust of the concept of cultural degeneration.

There are two schools of diffusionism, the German-Austrian and the British. The former posits some seven or eight original *Kulturkreise*. These are not, as the name might seem to imply, geographical spheres or areas of culture, but are culture types or blocks of cultural material, each of which at one time in the past is assumed to have existed as a discrete, internally uniform culture, presumably of independent origin, in one part of the world and then to have diffused essentially as a unit. These several culture blocks originated successively in time as well as progressively in degree of advancement or complexity; and, through each spreading more or

less over the whole planet, have become represented in all cultures in an interpenetration or overlay of varying proportions. The task of culture history is the segregation of any given culture into the elements derived from the several *Kulturkreise*.

The *Kulturkreislehre* was first conceived by Foy and Graebner, promulgated chiefly by the latter, supported for Africa by Ankermann and attacked by Father Schmidt. The latter, however, soon became a convert and has since, with his associate Koppers and others, modified and amplified the hypothesis, depriving it of its original rigor and lack of specific placing in time and space by tying the scheme in wherever possible with linguistics, archaeology and history. The term *Kulturkreis* is being abandoned and the phrase *kulturgeschichtliche Methode* substituted, which is unfortunate in its implication that the study of culture history, at any rate among non-literary cultures, must be carried on through acceptance of the special assumptions of this school. Probably not far from half of the ethnologists of Austria and Germany either profess adherence to or have been influenced by the views of this school.

The British school originated a few years later with G. Elliot Smith, Perry and Rivers, whose respective roles might be roughly characterized as inspirer, protagonist and moderator. This school also has undergone some modifications and is best represented in its recent form by Smith's *Human History*. In contrast with the German school it is monogenetic. Primitive culture is conceived as essentially stagnant, inclined to retrogression as much as to progress. It is contended that at one time and place in human history, namely, in Egypt around 3000 B.C., an unusual constellation of events produced a cultural spurt leading to the rapid development of agriculture, metallurgy, political organization and kingship, priesthood, concern with the after life and mummification, writing and other cultural institutions. From this center of origination this great cultural complex was carried in whole or in part, with secondary embellishments and degenerations, to Mesopotamia and the Mediterranean world, to India, Oceania, Mexico and Peru and in fragmentary form even to remote peoples who remained otherwise primitive. The remainder of culture history is essentially the story of the minor modifications of this one great culture, until the Greeks began to dissolve and replace it by civilization.

The British school has won about the same degree of adherence at home as the German; and likewise has tended to label as evolutionists and antidiffusionists all students who showed themselves unsympathetic to its full tenets. It is perhaps significant that both schools have made practically no converts from each other nor outside their countries of origin. Scandinavia, France and the United States have held almost unanimously aloof.

The methodological weaknesses of both diffusionist schools may be summarized as follows. Granted a certain modest empirical beginning, they very early took a long a priori leap and since then have been forced to depend largely on selected evidence or construals of evidence to maintain the position thus taken, genuinely inductive inquiry being relegated to the background. The basic schemes are too simple to seem adequate to most culture historians and anthropologists. The mechanisms used, with their primary insistence on diffusion, are also too simple.

The virtues of the schools are in part associated with this overemphasis on diffusion, whose strength they have at any rate shown, thus helping to clear the ground of the older school of evolutionism or naïvely psychological theories of stages of progress. They have also made probable the specific connection between a number of geographically separate culture elements or complexes, and they have drawn fresh attention to culture history as a study of universal human interrelations. The future will probably characterize their theories as over-shootings of a newly discerned and legitimate mark.

DILKE, SIR CHARLES WENTWORTH, SECOND BARONET (1843-1911), British statesman. After graduating from the Cambridge Law School Dilke traveled throughout the British Empire making an intensive inspection and embodied the results in *Greater Britain* (2 vols., London 1868; 8th ed. 1885). Entering the House of Commons as member from Chelsea he at once showed himself to be an extreme example of that saving virtue of the British conservative ruling class in contributing leaders to its political opponents, the progressives. He not only became the first and foremost leader of radical Liberalism but he was also the first and last leader of a revival of British republicanism. In his parliamentary indictment of the monarchy on grounds of economy (1871-72) he was not supported by his party, but he was sustained therein by his constituency (1874). When the Liberals returned to power in 1880 Dilke, with Joseph Chamberlain as his principal lieutenant, was the acknowledged leader of the radicalism which seemed to be the logical successor to Liberalism. Gladstone reluctantly took Chamberlain into his cabinet but under court pressure relegated Dilke to a minor post in foreign affairs. This was, however, work for which Dilke had prepared himself and in which he at once made his mark. He had to be admitted to the cabinet in 1882 and rapidly advanced to the position of heir presumptive to Mr. Gladstone and the Liberal premiership. Both in internal reform and in international affairs his mastery of detail and his grasp of principle, his commanding presence and his compelling powers, made him dominant. When the government fell in 1885 he had become not only the driving motive force but also the directing mind of British progressivism.

Dilke's career, just as it was reaching its culmination, was virtually ended by an unfor-

fortunate divorce scandal in which he was implicated. He resigned his seat, devoted himself to imperial issues and published his *Problems of Greater Britain* (2 vols., London 1890) and *The British Army* (London 1888), which are still of value. He returned to Parliament in 1892 as a private member and put his exceptional information in industrial and international issues at the service of the new dynasty—the Labour party. If, as many of his friends believed, the British ruling class deliberately ruined their radical colleague for a private irregularity such as was considered no breach of their own code, then they paid heavily for their hypocrisy. For, had Dilke with Chamberlain succeeded to Liberal leadership in the eighties, the advent to power of a Labour party would have been postponed for another quarter century.

GEORGE YOUNG

Consult: Bodelsen, C. A., *Studies in Mid-Victorian Imperialism* (Copenhagen 1924) p. 60–75; *The Life of the Rt. Hon. Sir Charles W. Dilke*, begun by Stephen Gwynn, completed and ed. by Gertrude M. Tuckwell, 2 vols. (New York 1917); Mealey, John, *Life of William Gladstone*, 3 vols. (new ed. New York 1911) vols. ii–iii.

DILL, SIR SAMUEL (1844–1924), British historian, philologist and administrator. He was educated at Queen's College, Belfast, and Lincoln College, Oxford. He taught Greek at Corpus Christi, Manchester University and Queen's, Belfast. In his later years he devoted much time to administration and to service on various educational boards and commissions. Dill's interests lay especially in cultural and religious history. His *Roman Society in the Last Century of the Western Empire* (London 1898; 2nd ed. 1899) attracted wide attention because of its thoroughness, sanity of judgment and charm of style. The next volume, *Roman Society from Nero to Marcus Aurelius* (London 1904; 2nd ed. 1905), based chiefly upon the extensive literary sources, provided a sounder and better balanced judgment of the epoch than did Friedländer's *Sittengeschichte*. For a description of the society of the period as affected especially by thought and creed it is still the best work in the field. His last volume, *Roman Society in Gaul in the Merovingian Age* (London 1926), not quite completed by the author and published by his associates, is of little value. It is merely a very successful recomposition of the materials found in the works of Gregory of Tours and the other literary sources, without any attempt at historical criticism and with an almost complete dis-

regard for archaeological materials. The title itself is a misnomer. Dill's contribution lay not in a critical use of precarious sources or in the unearthing of new ones, but rather in a penetrating interpretation of sources that were in themselves fairly reliable.

TENNEY FRANK

DILLON, JOHN FORREST (1831–1914), American jurist. Dillon was admitted to the Iowa bar in 1852 and was a justice of the Supreme Court of that state from 1862 to 1869. For the next ten years he held office as United States judge for the Eighth Circuit. In 1879 he became a professor of law at Columbia University and lectured on real property and equity until 1882, when he devoted himself to the practise of law. He was the founder of the *Central Law Journal* in 1872 and was president of the American Bar Association from 1891 to 1892.

Judge Dillon's work upon the bench contributed largely to the development of American law, but his reputation as a legal scholar rests mainly upon his *Law of Municipal Corporations* (Boston 1872; 5th ed., 5 vols., 1911), the pioneer American treatise on the subject and a work which created municipal corporations as a distinct branch of the law. This legal classic, which was at once recognized as a profound and philosophic study of the law of local government in the United States, was and still is accepted by the courts as a leading authority in this field. More than any other work it has influenced both the legislatures and the courts in formulating that great body of law which delimits the relations of our local governments to the state and to the individual.

In 1894 *Laws and Jurisprudence of England and America* (Boston) was published. In it, despite the fundamental conservatism and deep veneration for existing legal institutions, Dillon showed himself a leading advocate of the modernization of the American real property law and also of the codification of specific fields of the common law. These aims are gradually being realized in our uniform acts and in the restatement of the law sponsored by the American Law Institute.

CHARLES W. TOOKE

Consult: Stiles, E. H., *Recollections and Sketches of Notable Lawyers and Public Men of Early Iowa* (Des Moines 1916) p. 183–211; Hubbard, Harry, "John F. Dillon" in *American Bar Association Journal*, vol. xiv (1928) 77–79.

DILTHEY, WILHELM (1833-1911), German philosopher. Dilthey was trained in the critical-historical school of Böckh and Ranke and in the philosophical tradition of Trendelenburg. In 1866 he became professor of philosophy at the University of Basel and later at Kiel and Breslau; in 1882 he succeeded Lotze in Berlin.

Dilthey's philosophical work was begun at a time when the metaphysical construction of a logical world order was losing favor and when, on the other hand, positivism and neo-Kantianism with their application of the methods of natural science were proving inadequate to the task of a general study of man and a philosophical approach to the social sciences. In a long series of papers and more especially in his *Einleitung in die Geisteswissenschaften* (Leipzig 1883) and in his *Der Aufbau der geschichtlichen Welt in den Geisteswissenschaften* (Berlin 1910) Dilthey attempted to construct a new methodology and a new interpretation of the study of society and culture. He drew a definite distinction between the social and the natural sciences: the latter aim merely to describe and conceptualize (*begreifen*); the social sciences, concerned with the realm of ends and values instead of laws, should aim to understand (*verstehen*). As a basis for such study he postulated the need of an analytic and descriptive psychology concerned with a systematic knowledge of the nature of consciousness and of the inner unity (*Strukturzusammenhang*) of individual and social life and an understanding of the historical development of this organic unity in scientific, artistic and religious forms. He was as a result led into a comprehensive research in the history of intellectual development, bearing fruit in his never completed *Leben Schleiermachers* (Berlin 1870; new ed. by Hermann Mulert, Berlin 1922); in his essays on the theme of human nature in the thought of the fifteenth to the seventeenth century and on the German philosophers, poets and historians of the eighteenth and nineteenth centuries; and in his brilliant *Jugendgeschichte Hegels* (Berlin 1905).

Dilthey is best characterized as the founder of the so-called *Lebensphilosophie*. The conception of life upon which his philosophy is based makes unnecessary the distinction between intellect and reality and the corresponding dichotomy of spirit and matter; it sets up his system in opposition to the traditional *Vernunftwissenschaft* type of philosophy. In social science Dilthey is important as the most famous exponent of the *Geisteswissenschaft* movement in

Germany. Throughout his work in this field he was concerned not with the problem of social control but with the conservation and objective revaluation of cultural forms. During his lifetime Dilthey's influence was limited to a small group of his students; but with the appearance of his collected works his influence permeated not only other schools of German philosophy but psychology, history, law and economics and resulted in the increasingly greater adoption of his methodology in these respective sciences.

DIMINISHING RETURNS is a general principle of productivity, pervading all forms of production. In its original and best known form it related to agriculture and would perhaps be most precisely stated as follows: apart from declining soil fertility and fluctuations due to the changes of weather increased use of other resources per acre of land yields increasing crops per acre but decreasing crops per unit of the other resources used. The other resources were originally spoken of as capital, which was understood to include amounts advanced as wages to labor during the period of the crop cycle.

In its more general form the principle applies to shifting proportions of different factors or groups of factors in any industry. When the physical output per unit of a factor or a group of factors is increased by increasing the amount of cooperating factors, the output per unit of the cooperating factors declines. It is thus a statement of elastic limits on the development of the latent possibilities of particular productive factors through the employment of larger amounts of cooperating factors. The term has been also applied to certain distinct though related facts, such as a decline in net financial yield or a historical trend toward higher agricultural costs of production.

Among the economists the principle of diminishing returns was first anticipated by Turgot in his comments on a prize essay written in 1767 (*Oeuvres*, ed. by G. Schelle, vol. ii, Paris 1914, p. 643-46). The principle of diminishing returns was implied by Malthus in his *Essay on the Principle of Population* (1798) when he stated that, while population tended if unchecked to increase in geometrical ratio and probably to double every twenty-five years, it was unthinkable that food production in England could maintain this rate of increase beyond the first quarter century, the utmost imaginable increase after that being represented by equal absolute increases in each twenty-five year period. In his *Inquiry into the Nature and Progress of Rent* (1815) he also suggested that increased use of capital on land already fully exploited would bring losses unless prices and rents should rise; he gave greater emphasis, however, to the necessity of taking up land of poorer quality. Later in an *Encyclopaedia Britannica* article on population (supplement to 4th ed. 1824, vol. vi, p. 307-33) he gave a definite statement of the law of diminishing returns. Before that, however, Sir Edward West declared that "each equal additional quantity of work bestowed on agriculture yields an actually diminished return" (*Essay on the Application of Capital to Land* . . . , 1815, p. 6) and Ricardo published his *Principles of Political Economy and Taxation* (1817).

Ricardo in his theory of rent definitely assumed that hand in hand with the taking up of poorer qualities of land there would naturally go an increasing expenditure on the better lands, subject to declining yield for the additional outlays of capital. Such criticism of the Ricardian theory as that of Henry C. Carey, who deduced from American experience a tendency to progress from less fertile to more fertile soils, is to a large extent beside the point, as the more fertile soils either required more outlays for clearing and development than the early settlers could afford or were less accessible from the early centers of settlement. Accessibility is of course a relative and shifting thing as a country develops.

Senior in his *Outline of the Science of Political Economy* (1836) developed and emphasized a contrast between agriculture, subject to diminishing returns, and manufactures, in which increasing returns were possible with increasing output. It is true that increasing agricultural production with the factor of land limited is

likely to exhibit the effects of diminishing returns in visible form unless counteracted by improvements; while manufacturing output can be increased without corresponding limits on any one factor or group of factors, thus allowing other principles to dominate the visible result. Even in manufactures, however, a change in the proportion of factors is subject to the law of diminishing returns. A recent study (Cobb, Charles W., and Douglas, Paul H., "A Theory of Production" in *American Economic Review*, vol. xviii, 1928, supplement, 139-65) indicates that despite advances in technique during the two decades following 1900 the increase in fixed capital per worker in American manufactures has been from three to four times as great as that in physical product per worker.

Recent writers, particularly H. J. Davenport, have emphasized the distinction between the law of proportion of factors, in which the condition of diminishing returns is normal, and that of increasing productivity with increasing size of productive units or scale of operations. The mathematical implications of the former law were brought out by F. M. Taylor in an arithmetical example which he carried through all possible stages of varying return. Thus, operating with two factors, a constant area of land and an increasing amount of labor, five stages are possible. Product may increase faster than labor, as fast, slower, not at all, or it may decrease. When labor is in the first stage, land is in the fifth, since a concentration of all the labor on part of the land would actually increase the total product. Similarly, when labor is in the second stage, land is in the fourth, and when labor is in the third, land is also in the third. It is clearly wasteful to utilize any costly factor in either the fourth or fifth stage; hence economy requires that wherever technical conditions permit costly factors be used in the third stage, where both are under diminishing returns. The same principle applies to any number of factors and can be expressed by algebraic methods.

The generalized law of the proportion of factors underlies the theory of distribution of the marginal productivity school. It is possible to prove that if the price of each contributing factor is equal to the "marginal product" of that factor, the sum of the shares thus apportioned to the owners of the contributing factors would equal the total product. This is true, however, only under certain simplified conditions which are not fully carried out in practise. The principle of marginal productivity does not

apply fully to parts of an organic productive unit. Changes in the scale of production bring changes in efficiency which disturb the basic assumption that an evenly spread increase in the quantity of all factors employed will result in an equal proportionate increase of output. Management, research and the other overhead costs of plants working at part capacity do not fit into the simplified picture. Long run trends may exhibit diminishing returns while shorter fluctuations are dominated by other principles. The place of each in the complex reality has not been fully worked out.

The relation between diminishing technical returns and the behavior of financial returns is a source of some confusion, although the basic principles are relatively simple. The term diminishing returns is unfortunately often stretched to cover any decline in net money earnings, whether due to increased money costs of production or to the decline in price following an increase in the supply of the product. The application of the term diminishing returns to increased money costs may lead to confusion, because as has been shown above the use of costly factors in any but the stage of diminishing technical returns is financially wasteful. The decline of price, on the other hand, is a matter of demand schedules and not of the laws of production as such. An increase of a generic factor of production, such as capital, will not increase the output of one commodity only and thus will not be limited by the ordinary type of demand schedule.

It is true that many business activities are not directly concerned with the physical production of goods but with the creation of demand, the maintenance of prices, with financial operations, lawsuits and even political propaganda. But it is still possible to say that almost any technically definable end may be gained by using contributory factors in varying proportions, whether the proximate end be the creation of a cigarette, of a billboard advertising it or of political propaganda against anticigarette laws. And the proportioning of factors to secure any end exhibits the principle of diminishing returns.

DIMINISHING UTILITY. See VALUE; ECONOMICS.

DIOCLETIAN (C. Aurelius Valerius Diocletianus) (245-313), Roman emperor. Diocletian was born in Dalmatia and became emperor in 284. His reign ushered in an autocracy characterized by deification of the ruler, prostration in his presence, elaborate court ceremonial, the exclusion of the senate from participation in imperial government, reduction of Italy to the status of the provinces and the concentration of all authority in the hands of the emperor. By sharing his power with a colleague and choosing two Caesars as their successors designate Diocletian discouraged rebellion and rendered possible a more effective conduct of the administration. The bureaucracy was reorganized by separating the civil and military careers and filling the administrative departments with a subordinate personnel organized on a strictly military model. Its numbers grew greatly with the doubling of the list of provinces and the creation of four prefectures and twelve dioceses. The military establishment was increased and was rendered more efficient by the organization of a central field army. The provincial garrisons were placed under the authority of military dukes and counts. Economically as well as politically the interests of the state overshadowed those of its population. The older taxes were abolished in favor of the hitherto irregular requisitions of supplies (*annona*), now made a permanent levy based on units of land (*juga*) and number of men and animals cultivating it (*capita*). Diocletian's edict of prices was a well meant but futile effort to check an increase in the cost of living resulting from an attempt to reform the coinage. Influenced by the Caesar Galerius in 302 A.D. Diocletian initiated the last and greatest persecution of the Christians in the

empire. At his retirement in 305 this great organizer had laid solid foundations for the administrative, fiscal and military systems that characterized the late Roman Empire.

A. E. R. BOAK

Consult: Seeck, O., *Geschichte des Untergangs der antiken Welt*, 6 vols. (Berlin 1897-1921) vols. i-ii; Rostovtzeff, M. I., *The Social and Economic History of the Roman Empire* (Oxford 1926) ch. xii; Stein, Ernst, *Geschichte des spätromischen Reiches*, vol. i- (Vienna 1928-) ch. i.

DIPLOMACY is the method in common use today of communication between governments. All governments at all times and in all parts of the world have used envoys in communicating with other governments or authorities. There are traces of the practise recorded on Assyrian tablets, in Greek and Roman history and in ancient China and India. But there is no direct connection between such practises and what we call diplomacy. Nor is there any direct connection between the modern system and the practise of the mediaeval Roman church in sending legates or dealing in the Curia with representatives of local interests, ecclesiastical or political. In its present form diplomacy bears the marks of conceptions of government dominant during the Renaissance, when the system and methods now operative had their origin. The republic of Venice may be considered to have founded diplomacy as we know it. In the sixteenth century it maintained envoys in Switzerland, Naples, Turin, Milan and London as well as ambassadors at the courts of the emperor and of the kings of France and of Spain. Later the kings of France and of Spain maintained continuous representation in various cities. But the practise of sending special missions for specific purposes continued to be prevalent until the seventeenth century. Indeed, the business of government in earlier times did not require a system of intergovernmental relations, and even when permanent contact between governments was found indispensable it remained the practise in many cases to maintain abroad a subordinate class of envoys as distinguished from ambassadors with full rights and powers. Thus the United States did not maintain abroad any officials of a higher rank than that of envoy until 1893. The essential characteristic of the diplomatic system, however, is the permanence of the agent in residence at some foreign seat of government. Although the method called diplomacy was practised by temporary agents at all periods, the status and

function of the diplomat were not recognized until the chief governments came into continuous contact through agents residing abroad. The existing system first operated in Europe in the early seventeenth century; it has since become world wide, having proved itself essential to modern government.

When the diplomatic system arose, most states were monarchical and the court was the center of political and economic power and of cultural influence. Even today diplomatists are supposed to be accredited to courts, where such exist. Furthermore, early diplomatic representatives, as the personal deputies of sovereign monarchs, were generally of the courtier type and frequently members of the highest nobility or, due to their international connections and their relatively superior education, members of the high clergy. Non-professionals are sometimes chosen ambassadors or ministers, in the United States especially, in reward for political services or as a consolation for political defeat or in many countries for specific competence, such as a knowledge of finance or a close connection with the particular foreign nation. Most diplomatists, however, are professional. They have been trained as attachés abroad or as secretaries in their ministries for foreign affairs. The development of a permanent professional diplomatic service, while tending to replace the monarch's personal choice with systematically trained and chosen officials, retains the general atmosphere of the restricted capital society in which as an agent of royalty the older type of diplomat moved. In almost every country the diplomatic service is practically closed to citizens of all but the most wealthy class. In some countries not even the sons of wealthy merchants or industrialists obtain easy entrance into the service, which is reserved for those who bear names of ancient dignity. In the United States, where there is less admission of such facts than in most other countries, the practise is supported by the government's refusal to provide public moneys for the use of diplomats in carrying on the lavish and extravagant entertainment functions expected of them. Hence the diplomatic caste is highly selected at the outset from among the wealthiest and most aristocratic group of citizens, and even within the service advancement is granted largely on a basis of wealth and social prestige. The manners of the drawing room are regarded as the most important qualification for diplomatists rather than a knowledge of foreign

Encyclopaedia of the Social Sciences

culture, business or political affairs. The social prestige which in mediaeval civilizations distinguished those unconnected with trade leads diplomatists to adopt the manners and customs of small cliques, which in old capitals often preserve a traditional culture unconnected with any political or economic power. Thus there also exists a tradition which in certain services divides the diplomatic career from the consular service. Diplomatists in addition to some knowledge of foreign tongues have also skill in adopting the forms of politeness common in circles in which they live in foreign capitals. The departments of governments dealing with foreign policy are usually staffed by the same social and intellectual types as are to be found in embassies and legations abroad.

The functions of a diplomat are still usually conceived to be mainly those of guarding the interests of his government in negotiations with the government of the country in which he resides. In each embassy or legation of important states in foreign capitals there is a staff of officials theoretically subordinate to the ambassador or minister. The most powerful of these, however, belong to the home war department and exercise an influence upon their government often independent of and sometimes contrary to that of the civil diplomatic staff. In very recent times commercial counselors and attachés have been added to the staff, and in a very few cases social attachés have been appointed for reporting upon industrial and similar problems. All these agents of each state at the capital of every other state constitute a body called the diplomatic corps. Thus in connection with the chief officials of the ministry for foreign affairs in each capital the diplomatic corps forms a microcosm of the state system of the world. The London diplomatic corps, for example, includes fifty-six embassies and legations, the smallest composed of two officials, the largest of seventeen. Among these are naval and military attachés in great numbers and a few commercial attachés. Such a body in each capital is in continuous contact with the foreign office (or ministry of foreign affairs or, in the United States, State Department) and communicates daily with its superior officials at home. The presence of other diplomatists and agents in any capital makes a difference in the work of each, since the influence of one diplomatist may be thrown against that of another. Certain common and largely formal interests of the whole corps in each capital, however,

tend to create an international caste of diplomatists. Such persons spend most of their lives away from their own countries. So far important posts in this caste have been held by only one woman, Mme. A. Kollontay, appointed to ambassadorships by the Soviet Union, but marriages occur which connect the diplomats of one country with those of another. The members of the corps in any capital are traditionally much concerned with precedence of one over another. The titular head of the corps, the *doyen*, has a social status of considerable importance as representative in some matters of the corps in a capital.

The rights of the diplomatist in a foreign country are the result of Renaissance conceptions and later adjustments to meet new needs. The diplomatist was originally a kind of spy. The general practise noted by Machiavelli and advocated by de Callières gave good grounds for suspecting the character of the influence wielded by a foreign diplomatist. The diplomatist used money, when he could, or any other means available to spread propaganda in favor of his own interests (even when designed to shake the stability of the local government), to undermine local political parties and to obtain secret information. Such influences still exist, as the Great War and more recent revelations of spying in foreign countries have revealed. The presence of military and naval attachés in foreign capitals is in fact an open form of the spying which is incidental to preparation for future war. Since it is necessary to grant certain facilities to diplomatists on the basis of reciprocity, international law recognizes that diplomatists have immunity of person and residence from the action of the law in the state in which they reside. A fiction has been created to support this practise: the diplomatist's residence has been supposed to be extraterritorial, or to be a part of the state which sent him out. Immunity of residence has sometimes been used to shelter refugees from the pursuit of their opponents and to maintain habits forbidden in the country at large. The case for the personal immunity of the head of an embassy or mission and certain of his staff seems to rest upon the need of free communication between diplomatists and their home governments, although here too a fiction has been created, namely, that as the personal representative of his sovereign the diplomatist enjoys the same immunities as apply to the sovereign's person. The reciprocal obligations on the part of the diplomatist

are not clearly established; but the old practise that the head of a mission should act as a judge and police authority within the area of immunity seems to be dying out. Informally, at least, the diplomatist submits offenses to the courts in the country in which he resides.

Under the protection of these privileges the normal diplomatic practises have developed in the same way in all states. There is daily personal contact between the members of the diplomatic corps and officials or responsible ministers in the several foreign offices. Information is exchanged. Formal ceremonies occasionally give an opportunity for making public the friendliness of the relations between the governments concerned. But a great part of the normal work of a legation is the collection of information from the press and other sources for forwarding to its home government. Reciprocally the legation supplies information about its home country to newspapers. Although it is still usual for diplomatists to confine their activities and restrict their knowledge to the capital, which is often quite different in social character and outlook from the country as a whole, the increased importance of newspapers in politics, especially that part of politics affected by foreign affairs, has resulted in great extension of the work of legations. The great press agencies (Associated Press, Reuter's, Havas, Wolff, Press Association, Tass and others) are closely connected with the diplomatic system, sometimes through legation attachés who are also agents of one of the agencies. Sometimes such channels of approach are widened by the purchase (usually secret) of a controlling interest in one of the major daily papers, which thereupon becomes in effect part of the legation apparatus. A particularly convenient manner of reaching the press is open to the foreign minister. Most foreign offices establish intimate relations with foreign newspaper correspondents in their capitals, winning their support by sagacious distribution of convincing arguments, professional favors, decorations of honor and even money. Such practises have gained sufficient influence over some newspapers to make the entire policy of their foreign correspondents consciously one of presenting only or chiefly the point of view of the government in power in the country in which they are working.

Such activities are supplemented by others, including those of a variety of institutions, international committees, exchange professorships and the like. The ambassador is usually

honorary president of an organization devoted to furthering cordial relations between his country and the country in which he is operating. Important natives with financial or sentimental interests in the foreign country serve in such an organization, whose activities include sentimental gestures (donating monuments, presenting medals and prizes and financing good will tours) and propaganda activities through the publication of specialized literature, the distribution of inspired news to the local press and the establishment of friendly contacts with politicians, journalists and other persons of influence.

Despite the commonness of such practises the exposure of secret machinations by diplomats is always the signal for a violent outburst against the responsible government, which is accused of base immorality in carrying on a practise general in all diplomatic services. A case in point is that of the Soviet Union. If the Soviet government may be said to have the same general views as the Third International or to control the latter body, then supporters or propagandists or representatives of the latter are presumably agents of the Soviets. If this be the case, their diplomatic work is similar to that of the semi-official or secret (and sometimes the accredited) diplomatists of other governments. That their subversive propaganda is open and frank is a minor technical difference. Similar agents of other governments carry on propaganda substantially subversive. The resentment stirred up against Third International or Soviet propagandists is similar to that against other diplomatists discovered to be engaged in similar activities, intensified by the anti-Soviet counterpropaganda of special interests. Thus a government can reach the general public in any foreign state by other means than those provided by the government of that state. The realities of diplomacy then are often quite different from the system described by international lawyers.

Consuls are agents, generally for commerce, residing abroad. The name and office arose in the eastern Mediterranean after the crusades, when Italian, Spanish and French merchants residing in the Levant elected one of their number in a city to exercise jurisdiction over their countrymen resident in that city. The powers of these consuls granted voluntarily by Islamic monarchs were later made a part of international law through treaties called capitulations. Similarly the chief foreign agents of

European merchants became government appointees. They remained, however, without diplomatic functions or privileges outside the Levant. Usually two kinds of consuls are to be found: one a professional, full time official who promotes the trade of the country from which he is sent; the other a local merchant, often of foreign nationality, who attends occasionally to matters of interest to merchants of the country whose government pays him. In the nineteenth century the growth of commerce and the increase in the number and importance of commercial treaties led to the appointment of more consuls and a recognition of the great importance of their work. Incidentally, since consuls were resident not only in capitals but in several districts of a foreign state, they could provide a much more general view of the situation abroad than the old fashioned diplomatist. This as well as the democratization of the diplomatic services has led to the closer association of consular and diplomatic functions, and some states have amalgamated the two services.

The minister or secretary in any state who is supposed to be responsible for the foreign policy of the government forms part of the whole diplomatic system. In traditional autocratic forms of government he is usually a trained official belonging to the diplomatic service. In monarchies the monarch is traditionally given more influence in foreign policy than in domestic affairs, partly because of the mediaeval and Renaissance custom of inter-marriage between monarchical families and because in Europe at any rate there is a blood relationship connecting the caste of royal families, but partly also because the political intelligence of citizens in most countries has not been so far developed as to affect foreign policy. In republics, similarly, the president tends to have more influence over foreign than over domestic policy. The foreign minister or secretary, however, deals with normal intercourse between governments; and in this, if he is an amateur or untraveled, he comes very easily under the influence of the caste of diplomatists inside his office and in his legation abroad. That permanent officials such as Sir Eyre Crowe in the British Foreign Office and Baron von Holstein in the pre-war German Foreign Office often dominate foreign policy has been revealed by published foreign office documents. A foreign minister, however, may resist or even control such influences if he has political power outside the world of officials. The policy of each

minister is delimited not only by influence of professional officials and diplomatists but also by existing treaties and even current negotiations begun by a predecessor. Even when a change of party in control of the government takes place, the so-called continuity of foreign policy holds good to a considerable degree. Extreme nationalism also prevents differences between parties or groups from showing in foreign policy. Hence diplomacy has tended to be conservative and traditional.

The growth of political intelligence in foreign affairs has made possible some changes of policy and reforms of the traditional system. The telegraph and in capitals not too far distant the telephone have reduced the importance of the ambassador or envoy. In the days when he was not in direct contact with his own responsible minister at home the diplomatist was able to negotiate and personally decide issues which he is now compelled to leave to his superiors. Much is still left to personal initiative where no great issue is involved, but in a crisis the diplomatist tends to become simply an office boy at the end of a wire. This naturally involves less responsibility and requires the employment of a kind of personality different from that of the diplomatists of the past. The old method, however, is continued in the practise of sending written documents through the ambassador, who then discusses the situation with the foreign minister. The personal influence of the ambassador (who generally represents the older traditions of nationalist and conservative diplomacy) may thus be very important in foreign policy.

For dealing with exceptional situations the traditional diplomacy provides the congress or conference. A congress as distinct from a conference is usually a meeting of responsible foreign ministers, prime ministers or other heads of governments for the settlement of peace terms after wars or for the framing of other treaties of multinational scope. The negotiations preceding such treaties have often been secret in that some of the parties affected entered into private understandings unknown to other parties. Thus there arise secret clauses of treaties or secret treaties. In order that these secrets may not be known to third parties, which are other governments, it is necessary that they should be secrets also unknown to the citizens in whose name or for whose interests the obligations involved have been contracted. Such citizens may eventually be com-

pelled to take action resulting as a consequence of agreements of which they never hear. Hence some feeling in modern states has arisen against secret diplomacy. The traditional method of defending the ancient practise is to urge that all negotiations or conversations must be secret or private while they are being carried on. This argument is in itself of little weight and irrelevant to the real issue, which is concerned with the binding character of the agreement ultimately reached but kept secret from the citizens whom it concerns. The Covenant of the League, which attempted to prevent such secrecy by requiring registration of treaties, has failed to prevent a new growth of secret military understandings which are not registered. In practise most citizens, even in states in which citizens are supposed to decide upon policy, eventually undertake under the pressure of propaganda in critical situations obligations to which their agents have committed them and which may or may not be to their real interest.

Conferences as distinguished from congresses are usually meetings of ambassadors or official plenipotentiaries for settling minor issues. A long series of congresses and conferences have been held ever since the Middle Ages. Most of them have produced treaties. After the Great War the practise of conference between heads of states was found useful until about 1924. There arose a peculiar institution, the so-called Ambassadors' Conference in Paris, a permanent body including the diplomatic representatives of the ex-Allied Powers and a French official, to carry on current business which the peace treaties of 1920-22 had left to the "Allied and Associated Powers." This form of diplomacy by conference between heads of governments and foreign ministers, from which great results were once expected, has been displaced since about 1924 by the older diplomatic methods and the growth of the activities of the League of Nations.

The League system provides the elements of a new diplomacy. First, it is the occasion for periodical personal meetings, at council and assembly sessions, of responsible ministers of the member states. Foreign ministers and consequently the political opinion and active political influences of their states come into close contact. A foreign minister, at any rate in a "democratic" state, usually knows more about the political or economic tendencies in his own country than does a diplomatist. This new form of diplomacy by conference, which has dis-

placed the occasional conferences that took place from 1920 to 1923, has the immense advantage of providing means whereby disputes can be settled by conciliation, and the League system may thus (under article II of the Covenant especially) prevent such a serious crisis as would before 1920 have inevitably led to war. Secondly, the League Secretariat provides skilled assistance for cooperation between governments, based not upon the traditional assumption of diplomacy that each diplomat stands for a separate interest but upon the assumption that common interests are important for all states.

The League system is new, and at first it grew in the dark. When it attracted the attention and jealousy of members of the old diplomatic services, a struggle arose. Within the Secretariat governments attempted to use the old methods, and the League system became in some cases merely a cover for the old game of "pull devil, pull baker" in the attainment of the fantastic "balance of power" which has been the evil dream of diplomatists since the Renaissance. This brought the League system into the diplomatic world. Although minor issues may be dealt with by cooperation, underlying such cooperation is the old preparation for future war which still dominates the foreign policy of most states. Foreign ministers and other representatives of political opinion are accompanied to League gatherings by staffs which include permanent officials representing the old type of diplomacy and exercising considerable influence over the heads of the delegation. Members of the Secretariat, which is hypothetically an international service paid out of common funds contributed by many states, are often looked upon by the governments whose citizens they remain as diplomatic agents of the old tradition seeking a special advantage, and they often act in that capacity.

Behind the old system, the new League system and the current practises of diplomatists, League officials and foreign ministers lies the issue of peace or war. The traditional diplomacy expresses the present social order's assumption of the possibility and even the probability of war. In the minds of the actual persons who have influence upon diplomacy and foreign policy there remains the conscious idea that "the state" is essentially opposed to other states. The state is therefore conceived primarily as a defense organization and secondarily as the instrument by which national or dynastic or

merely governmental interests are gained or defended against external groups called foreign or alien. Some vague doubt seems to have reached official quarters as to the distinction between "defense" of interests and the promotion of interests. In the Kellogg, or Paris, Peace Pact of 1928, for example, war is implied to be wrong except for defense, which presumably therefore is not "national policy"; and yet all national policy is explained as defense of legitimate interests. There is no way out of the logical impasse as long as the state is conceived as a defense organization and diplomacy as one of the instruments of the national policy of pressing interests opposed to other interests. Since diplomacy is assumed to be the advocacy of one interest against another and as the advantage of one state and its friends is assumed to be the disadvantage of other states, the methods of diplomacy are still often those suggested by Hobbes and Machiavelli. The interstate system, such as it was, of Renaissance states was a war system, in which peace was only an interval between wars. Each state had to use war as part of government, and diplomacy became an extended preliminary skirmish. The effort of diplomatists then is to secure allies and to obtain advantages of a strategic character in view of future danger. Thus finance and foreign investment and especially loans for expenditure on armaments have been the instruments by which diplomacy has secured friends for a future quarrel. Furthermore, to gain one's end in a war system deceit was necessary, especially in the preliminary diplomatic skirmish, and it still remains necessary in so far as there is a possibility of future wars.

The fraudulent character of diplomatic technique is then not altogether due to the nature of diplomacy itself but to the war system. The result upon the moral responsibility of agents has been noteworthy. All advocates pleading a special case tend to suppress what does not suit their case on the assumption that the other side also has an advocate. Thus diplomatists in the old diplomacy, regarding themselves as agents for one interest, lied and deceived on the assumption that they were advocates. The fundamental responsibility for such conduct rests upon those who derive advantage from force and fraud. But even foreign ministers sometimes still make the ancient plea of *raison d'état* or that other theory of irresponsible sovereignty *salus rei publicae suprema lex* as an excuse for acts that are considered as immoral or even as

illegal according to the accepted code of ordinary behavior.

Today, however, there is a vague feeling that honesty pays, and the rapid growth of international law and the much more exact thinking devoted to it may produce a new understanding of the comity of nations, with which Renaissance diplomacy will be inconsistent. The state, once conceived as only or mainly a defense organization, now deals with commercial intelligence, employment, public health and education, none of which are understood by the traditional diplomacy. Thus experts are continually used to assist diplomats ignorant of the real issues which concern modern states. Modern finance, commerce, industry and science have modified the state, or the nature of government, since the days when diplomatists were regarded as the chief experts on what was happening abroad. As a result the League system includes technical or specialist organizations and officials who connect the machinery of government across the frontiers of states in matters relating to labor legislation, public health, transport, finance and the like. Administrative offices and ministers of different states are in contact, often without the intervention or assistance of the foreign services.

Again, a new attitude among diplomatists, which may be called the new diplomacy, has begun to exist even if it is not understood by most diplomatists or most traditional authorities upon foreign affairs. This new attitude assumes the existence and the predominant importance of interests common to many states and to the peoples of those states. Health, social stability and the repression of violence are instances of such common interests. Upon this basis diplomacy is the pursuit by each government of interests common to many, and the method of diplomacy is cooperation not controversy. Should this view, not yet dominant in diplomacy, prevail it would make a great difference not only to the current business of diplomacy but also to the system and the persons employed. For example, such a conception displaces the military and naval attachés and removes such influences altogether outside the diplomatic system. These attachés stand for the old diplomacy of threat as a method of negotiation. They are "the state as defense." Their presence abroad depends upon the willingness of their governments to use threats of force as means of "persuasion" or to counter such threats by force. Again, the services of the

pleader or the advocate are less important and those of the expert in a special subject are more important in proportion as each state tends to cooperate with other states for specific purposes. The influence upon public opinion of the success of the League system in particular issues has had a very great effect upon the assumptions underlying criticism of foreign policy. It is not so commonly believed in modern states as it once was that diplomatists are augurs with a specially wonderful knowledge unattainable by common folk. Thus the social atmosphere surrounding diplomacy is changing; and even the most expert diplomatist has to breathe an air contaminated or invigorated by international finance, commerce and scientific intercourse. There is an immense increase in the influence of the newspaper, whose correspondents sometimes venture to know more about foreign countries than the diplomats of their own country resident abroad.

The value of these new developments depends of course on the character and objectives of the persons involved. In so far as the members of the new types of international organizations, conferences and the like are scientific experts or officials genuinely concerned with developing international cooperation rather than advantage seekers with the possibility of war corrupting their whole approach to international questions, the new bodies will function beneficially. In so far as journalists and publicists have the new approach, the press provides a channel for the new diplomacy. It must not be overlooked, however, that the same influences as those which molded the older diplomat have access to the new diplomat whether he be a member of the diplomatic service, an expert sitting on a technical commission or a journalist. The amount of change will be in direct correlation with the increased remoteness of such influences. The change of form in itself is significant only in so far as the new individuals functioning in substantially diplomatic capacities are free from the traditional group characteristics of the older diplomatists. The significance of the change depends on how free such individuals actually are of such characteristics. If they are altogether free, we are at the beginning of a new era in the relation between peoples.

DIPLOMATIC PROTECTION. The modern institution of international law which authorizes a state to interpose with another on behalf of its

nationals there residing or present does not much antedate the French Revolution. It came into being with the migration of citizens to foreign countries at a time when the system of national states had become highly developed. While that period happened to be one also of a growing individualism and *laissez faire*, the institution of protecting citizens abroad is not primarily a reflection of those modes of thought. It may better be assimilated to the primitive form of social organization in the clan and to an early and deeply ingrained way of thinking which deemed an injury to a member of the clan to be an injury to the clan itself, justifying collective revenge.

The modern legal foundation of the institution is said to rest upon a principle enunciated by Vattel: "Whoever uses a citizen ill, indirectly offends the State, which is bound to protect this citizen; and the sovereign of the latter should avenge his wrongs, punish the aggressor, and, if possible, oblige him to make full reparation; since otherwise the citizen would not obtain the great end of the civil association, which is, safety" (Chitty-Ingraham translation, Philadelphia 1854, bk. ii, ch. vi, § 71). This principle is ambiguous and misleading, and unjustified conclusions have been drawn from it. Not every injury to a citizen is an injury to his state. The citizen abroad does not carry his national flag with him. Like every other inhabitant he is subject to the local law. It is only when he is "denied justice," by being refused access to the courts or to other remedies or by being maltreated in defiance of local law or of the so-called elementary principles of civilized justice or of treaties, that his state has a ground for international complaint. If he is injured by a private person or even in many cases by a minor official he must seek the means of redress which the local law affords and then show a denial of justice before an international claim becomes justified. If there are no local remedies to which he can resort, the case is of course different. He is also excused from exhausting local remedies where there is obvious bias against him, where the courts are unable or unwilling to render justice, or where legislation requires them to decide in a way contrary to international law. In the case of unredressed injuries by higher officials an international claim for indemnity may also be justified, for the state is deemed to assume liability. In general, it is only when the state has after opportunity failed to prevent the injury or failed to afford redress or to punish the

guilty, and has thereby indicated indifference or complicity, that a legitimate claim arises.

The seriousness of the problem of diplomatic protection lies in the fact that the entire population of two states may become involved in a controversy over an individual or a private corporation. Arguments for and against the continuance of the institution have therefore been urged with considerable insistence. In its favor it has been said that it affords a guaranty of stability in the treatment of foreigners in less developed countries; that it tends to establish a process and measure of justice consistent with international law; that it thereby benefits indirectly the local population; that by its promise of aid to the maltreated national abroad and its prevention of future maltreatment of foreigners it gives an assurance which promotes investment and migration abroad and the development of countries not yet fully exploited; and that when life is in imminent danger it is humanitarian in its manifestations. Against the policy it has been urged that the clan conception is obsolete and that protection abroad involves the people of two countries in a dispute essentially private; that its tendency is to place a premium on superior military strength in contacts with weaker countries; that it substitutes the methods of politics for those of law; that it constitutes an invasion of the sovereignty and jurisdiction of weaker countries; that it makes the intervening state plaintiff, judge and sheriff in its own cause without adequate opportunity for an impartial investigation of the facts; that it thereby promotes injustice rather than justice; and that in its support of economic nationalism it makes for imperialism and war.

In the analysis of both argument and actual current practise with regard to diplomatic protection it is important to distinguish between the protection of life and of property. Arguments drawn from the necessities of protecting life in imminent peril under circumstances where law has broken down can hardly be invoked to sustain the protection of property interests. In current practise an increasing restraint in the protection of property is already evident in the hesitation to intervene on behalf of citizens when foreign nations default in their bonds or in cases of mere breach of contract, since these are not regarded as international offenses. Where only property is involved, armed force is being used now not nearly so often as formerly.

But there are still many defects in the operation of the institution. Whether the citizen

abroad has sustained a denial of justice is a purely legal question. The methods to be used in settling it should be exclusively legal and judicial. Actually, to a considerable extent, they are political and occasionally military. Under the present system all three parties to the issue—the individual claimant, the defendant nation and the claimant nation—are in a precarious position. If the individual is a citizen of a strong state he may be able, at its discretion, to obtain its aid; if not he is helpless. Whether he can obtain protection depends often on the momentary political relations between the plaintiff and defendant states, on the political strength of the defendant state and on other non-legal factors. Thus the individual's relief, which should be governed exclusively by legal rule, depends on the accident of his nationality and on the political balance of power. The defendant state, moreover, is in danger of having coercion exercised against it on the unilateral decision of a foreign government that its citizens' rights have been violated. The weaker the state, the more exposed is it to arbitrary intervention; in very weak states a liability amounting almost to a guaranty of security of foreigners and their property has on occasion been imposed. Such a state may, to avoid the threat of intervention or coercive measures, pay a claim essentially unjust. A strong defendant state, on the other hand, may without fear of interposition violate the rights of an alien and may decline to arbitrate. Nor, finally, is the plaintiff state exactly in a happy position. It must make ex parte determinations on inadequate evidence and may be influenced by domestic political considerations to espouse a claim it should not support. On the other hand, it may be unable, by virtue of its political relations, to press a claim essentially sound.

Such a system of arrangements does not make for the growth of law or for peace. As an alternative it has been suggested in numerous circles both in the "exploiting" and "exploited" countries that the citizen abroad be left to bear the risk of his location and that he should take the law unqualifiedly as he finds it. The effort of defendant governments to force aliens to abide by a "Calvo clause" and forego the privilege of invoking the diplomatic protection of their own governments, whether embodied in constitution, law or contract, has not been generally successful; and states have refused to be bound by such an alleged waiver on the part of their citizens abroad. The suggestion of leaving the

citizen unreservedly to the local law for his redress, however, may on occasion result in depriving him of due process.

The weakness in the administration of protection can be to a considerable extent remedied by making a resort to arbitration more automatic than it now is. At the Pan-American conferences of 1901-02 and 1910 and at the Washington conference of 1929 the nations on the American continent committed themselves to arbitrate pecuniary claims. By article 36 of the Statute of the Permanent Court of International Justice the signatory nations commit themselves to obligatory arbitration of such claims. Possibly the habit of such judicial submission and the wider reign of law which it implies will gradually limit the defects of political protection. A movement has also been in existence for some years contemplating the possibility of permitting individual aliens, where denial of justice can be alleged, to sue states before an international forum, thus making diplomatic recourse less necessary. The primary purpose to which all remedial proposals must be directed is to assure the alien the protection of due process of law without involving the necessity of political coercion and all its international complications.

DIRECT ACTION. The use of this term to denote a theory of the methods of the labor movement dates from the beginning of the twentieth century, but as a vague phrase it occurred in labor and socialist discussions a generation earlier. Its origin is connected with the emergence of mass labor movements between 1868 and 1872 in France, Belgium, Switzerland, England, the United States and other countries and with the activities of the First International. These mass movements

revealed for the first time the power of economic labor organizations and their potentialities in the socialist and anarchist struggles against private property and state authority and gave the anti-Marxian elements of the day an argument in favor of what they called direct methods as opposed to governmental protection and parliamentary procedure.

With the development of trade unionism and socialism in western Europe and the United States between 1880 and 1900 the vague antithesis between political and economic action became a more definite issue. Owing to the unevenness of industrial development as well as to variations in national tradition and cultural antecedents the solution of this issue proceeded along different lines in the several countries. In Germany a reconciliation between the two methods was achieved in the social democratic movement, which recognized trade unionism and political action as its "two arms." In England a state of mutual tolerance was effected, though economic methods remained for the time being in the ascendancy. But in France the trade unions, annoyed and hampered by the overshadowing prestige of the political socialist groups and by the disruptive competitive bidding of these groups for the loyalties of the workers, turned sharply against all politics and in favor of the complete independence and self-sufficiency of economic organization and industrial methods.

Had this tendency worked alone it might have given rise in France to a labor movement similar to that which was developing simultaneously in the United States. The leading elements in the French trade unions were, however, traditionally socialist or anarchist and were as much concerned with doctrines and methods for the abolition of capitalism as with problems of trade unionism. This condition brought to the fore in the French trade unions the anarchists and other anti-Marxians who derived their inspiration from the First International and from older French revolutionary movements. These groups impressed the trade unions and the discontented socialist workers with the anarchist criticism of parliamentary democracy. Their contention that parliamentary democracy is merely a sham and a delusion for the workers was strengthened by the evidence that the growth of democratic government did not always help the workers in their disputes with employers, that parliamentarism tended to divert the labor movement from revo-

lutionary aims to political issues and social reforms, and that political democracy favored the intellectuals in monopolizing the political and economic leadership of labor. As a result the French trade unions fell under the influence of the antipolitical, antidemocratic and anti-intellectual element which had been active in the French labor movement since the days of Proudhon, and between 1895 and 1906 they developed the theory of revolutionary syndicalism, in which the concept of direct action held the central place.

This development in French trade union circles was paralleled by two movements among French socialists to revise the philosophy and methodology of Marxism. The right revisionists, led by Jaurès, tried to orient socialism toward Kantian moral precepts and a greater faith in political democracy. The left revisionists, Sorel, Lagardelle and Berth, stimulated by the writings of Nietzsche, Renan and Bergson, drifted toward intuitionism, creativism and a moral activism which stressed the value of the strenuous life and the historic role of the trade union movement; between 1900 and 1906 these writers helped to give the idea of direct action a larger moral content and philosophical clarity.

As the characteristic and challenging doctrinal element of revolutionary syndicalism direct action is bound up with the idea of class struggle. It is conceived as the dynamic power which transforms the vague class feeling of the workers into a clear class consciousness, giving vitality to the class struggle—presumably the only creative force for improving the position of the workers in the present and for developing the will power and the moral character of the workers necessary for their final emancipation. Direct action can perform this function because it calls for activities in which the workers are themselves the participants and in which their intellectual and moral capacities and energies are fully aroused and put to the test.

Direct action includes various specific methods which may be classified into two groups: those used against employers and those used against the state. Among the former are the well known devices of the strike, the boycott, the label and sabotage. These methods have of course been most frequently used entirely apart from any conscious program of direct action. Nevertheless, even in the form in which they are used by conservative trade unions they tend to pit the workers directly against employers and to educate them concerning their economic

status and social possibilities. But direct action tries to refine and develop these devices so as to accentuate their revolutionary and educational effects. The exponents of direct action have perfected various forms of strike strategy as well as the "strike on the job" (bad, slow or stupid work), the *grève perlée* (misdirection of baggage or perishables) and other forms of sabotage. Some of these forms tend to produce violence, which, however, is not always intended and is not a necessary part of direct action. The essential element in all the economic methods of direct action is the great extent to which the workers are made to act individually and collectively and are brought face to face with the economic and social implications of their economic status.

The methods of direct action used against the state include mass propaganda, agitation, manifestations, demonstrations, antimilitarism, antipatriotism and any other means which may compel a government to make concessions to the workers. They exclude participation in parliamentary politics and in electoral campaigns because the parliamentary system is regarded as the opposite of direct action and as tending to develop policies of bargaining, compromising and collaboration which are destructive of the moral character and militancy of the workers.

By direct action against employers and the state the workers can wrest from the ruling classes reforms which may improve their condition today. Such reforms, however, cannot pacify the working class because they do not alter the fundamental evils of the wage system. On the contrary, every successful strike, every effective boycott, every gain in wages, every shortening of hours of work, every improvement in the general conditions of employment, strengthens the workers' urge for more power and sharpens their will for the final battle. That battle, which will be the supreme and last act of the class war and which will free the workers forever, will be the general strike.

Direct action implies the initiative, the example and the leadership of a conscious minority devoted to the interests of its class. Every strike, every labor demonstration, every movement of the working class, is generally started and guided by such an active minority. The conscious minority, however, can succeed only by setting in motion the generally inert mass of the working men and by making them participate directly in the struggle. The action of the conscious minority is thus the opposite of

the action of parliamentary representatives, who are bent on doing everything themselves and on keeping the masses quiet and inactive. The conscious minority is the true advance guard of the working class and comes into being through a natural process of selection in the trade unions of the more sensitive, able and alert workers, who assume the leadership and direction of the mass.

Direct action as a doctrine of methods and of collective labor action was definitely adopted, to the exclusion of political action, by the French Confédération Générale du Travail at its congress in 1906 in a resolution known as the Charter of Amiens. Between then and 1910 the doctrine spread to England, the United States, Italy and several other countries, giving rise in those countries to new political and industrial labor movements. In its migrations it underwent many modifications. The Industrial Workers of the World in the United States altered the doctrine in its application to collective agreements by renouncing them. The Italian trade unionists applied it in somewhat different form in their agricultural syndicates. In England it was reinterpreted by the guild socialists and by the British syndicalists. In all these countries the adoption of direct action was due to disappointment with parliamentary labor parties and with the slow methods of the older trade unionism and reached its climax during the great labor unrest from 1911 to 1913 caused by industrial depression, stagnant wages and the rise of the unskilled.

After the eclipse of all revolutionary doctrines during the first three years of the war direct action again became a subject of discussion in labor and socialist circles with the formation of the Third International in 1919. The Russian Communists, in their efforts to form an alliance with the syndicalists of France, Spain and Italy and with the American I. W. W., were forced to consider the theories of direct action advocated by these groups. The discussions of these theories were carried over from the Communist International to the Red International of Labor Unions in 1921. There seemed a possibility for a while of some reconciliation of the syndicalist doctrine of direct action with the communist theories of social revolution and proletarian dictatorship. The attempt failed, however, and in 1923 the syndicalist advocates of direct action broke away from the Third International.

Since then the outstanding exponents of

direct action have been the anarcho-syndicalists, who form small groups in the labor movements of Germany, France, Holland and Sweden and are of greater importance in the labor movements of Spain and of Latin America. In its present day version direct action is essentially a restatement of the pre-war doctrine. The difference lies in the incorporation of some of the newer methods and strategies developed since the war, such as the demand for co-management in industry and the struggle for the six-hour day, and in the opposition to the communist idea of the dictatorship of the proletariat on the one hand and to the International Labour Office of the League of Nations on the other. The present day theorists of direct action also draw a clearer line between mass strikes by workers of the same trade or industry or several related industries for some improvement under capitalism and the social general strike which will usher in the social revolution. They also put greater emphasis on the need for international organization and look to the lead of their International Workingmen's Association, whose headquarters are in Berlin.

The concept of direct action has exercised considerable influence in contemporary political and labor movements and on contemporary political and social thought. The ideas of the general strike and of the conscious minority can be traced directly and indirectly in communist thinking and action. Through the I.W.W. the idea of direct action has influenced American trade union structure and strike strategy. On the other hand, direct action was the first significant revolt against the reformist interpretation of Marxism, the first proclamation of the moral character of the social struggle and the first effort to apply the newer philosophical and psychological ideas to the problems of the labor movement. Through its influence on the younger French, British and American political writers and sociologists the doctrine of direct action has contributed to present day criticism of sovereignty and of the democratic state, and through its analysis of the processes of the social struggle it has augmented the interest in the study of the dynamics of economic and social institutions.

DISARMAMENT. According to common usage the term disarmament is synonymous with reduction of armaments. Although international efforts to achieve general voluntary reduction or limitations of national armaments have fallen short of their objectives (*see* LIMITATION OF ARMAMENTS), partial and local disarmament may be said to have resulted, first, as a consequence of bilateral agreements and, second, as a result of compulsory disarmament imposed from time to time upon a defeated power as a sequel to conquest or as a condition of peace terms.

The first type is exemplified in the Rush-Bagot Agreement of April 8, 1817, in which Great Britain and the United States limited the naval armament on the Great Lakes to three vessels for each power. It appears, however, that neither party has strictly lived up to the terms of the agreement, apparently because it has not been revised to correspond with modern conditions. Nevertheless, the Rush-Bagot Agreement has had the effect of preventing the construction of large and hostile fleets on the Great Lakes. Had the United States and Great Britain been involved in serious disputes for which no pacific solution could be found, it is doubtful whether the Rush-Bagot Agreement would be in effect; but few such disputes have existed. Since 1909 many controversies between Canada and the United States have been settled by a joint high commission. The Rush-Bagot Agreement illustrates the thesis that disarma-

ment and effective machinery for the settlement of disputes must go hand in hand.

A large number of agreements have been concluded which have provided for the razing of fortifications on strategically located territory. For example, the Peace of Utrecht of April 11, 1713 (art. ix), provided that the king of France should demolish the forts of Dunkirk. In the Treaty of Paris, February 10, 1763 (art. vi, xvii), Great Britain ceded the islands of St. Pierre and Miquelon to France on condition that they should not be fortified and that only a guard of fifty men for police purposes be maintained. Great Britain also agreed to demolish the forts erected by British subjects on Spanish territory in the Gulf of Honduras (for similar provisions see also art. vi, Treaty of Lunéville, February 9, 1801; art. 12, Treaty of May 30, 1814, between Prussia and its allies and France; art. iv, convention of August 13, 1814, between Great Britain and the Netherlands; arts. iii, v, second Peace of Paris, November 20, 1815; art. iii, Treaty of London of May 11, 1867; Treaty of the Fortresses, December 14, 1831). Within recent years agreements have provided that no fortifications shall exist in Luxemburg, in the Strait of Magellan, in certain parts of Bulgaria and Montenegro, below the Iron Gates of the Danube, in a ten-mile zone along the frontier between Burma and Tibet, on the island of Sakhalin, on the Moroccan coast across from the Strait of Gibraltar, in a zone along the frontier between Sweden and Norway, on the Åland Islands or on Spitsbergen. The Treaty of Versailles required the dismantling of German fortifications in certain regions of the Baltic and of all fortifications within fifty kilometers east of the Rhine and prohibited the construction of new fortifications in the latter region as well as in the Saar. Military and naval bases and fortifications were also prohibited in the B and C mandates. By article 19 of the Naval Treaty of February 2, 1922, concluded at the Washington Conference, the construction of new fortifications and bases in certain possessions of the United States, the British Empire and Japan in the Pacific was prohibited. Finally, the Straits Convention of July 24, 1923, provided for the demilitarization of both shores of the Dardanelles and the Bosphorus, except for Constantinople. To prevent this demilitarization from injuring Turkey the Allied Powers agreed to meet any act of war or threat of war in regard to the straits "by all the means" that

the League Council "may decide for this purpose." Thus while defortification agreements have been numerous they have been applied only to small areas and have not therefore met the major problems of disarmament.

With respect to compulsory disarmament one of the earliest examples was that imposed by Rome upon Carthage at the end of the Second Punic War. Under the terms of the treaty of 201 B.C. Carthage promised to surrender her war vessels, except ten triremes, and all her elephants (Polybius, xv: 18). In modern times the United States has used its influence to induce contending factions in Central American and Caribbean revolutions to disarm. Such was the case in the Honduras revolution of 1911, brought to an end by a peace agreement which included a provision for disarmament, and in the Nicaraguan revolution of 1925 to 1927, which was brought to an end by the Tipitapa Agreement of May, 1927. In negotiating the latter agreement the American representative, Colonel Henry L. Stimson, declared that if the Nicaraguans did not voluntarily disarm the United States would forcibly oblige them to do so. Likewise at the beginning of the occupation of Haiti in 1915 the American authorities signed an agreement with the *cacos* chiefs whereby the latter agreed to turn in their arms and ammunition. Those *cacos* that did not do so were to be treated as bandits.

The two outstanding historical examples of compulsory disarmament, however, are the famous *Articles séparés*, concluded during the Napoleonic wars, and the provisions of the peace treaties of 1919-20. Prince William of Prussia, following his defeat by Napoleon, signed at Paris in September, 1808, an agreement which required the reduction of his army to 42,000 men for a period of ten years and which, moreover, prohibited the organization of a militia. Prussia soon evaded these provisions, however, by passing through the ranks as large a number of men as possible, thus building up a trained reserve and foiling French inspection through various means.

At the Paris Peace Conference of 1919 the allied governments imposed drastic disarmament provisions upon the defeated powers. The size of the armies of the defeated powers was fixed as follows: Germany, 100,000; Hungary, 35,000; Bulgaria, 33,000; Austria, 30,000. Conscription was abolished and voluntary enlistments must be for a term of twelve consecutive years; discharges must not exceed 5 percent

of the total effectives in any year. Educational or sporting organizations must not concern themselves with military matters (part v, Treaty of Versailles). The purpose of these provisions was to prevent the building up of a large trained reserve. Moreover, the German general staff was abolished, munitions factories with certain exceptions had to be closed and the export and import of arms were prohibited. Germany was forbidden to manufacture or import any tanks or armored cars or to maintain any guns and howitzers of a caliber exceeding 7.7 cm. and 10.5 cm. respectively, except when already mounted in fortifications not ordered disarmed. The armament establishment of the German army cannot be changed without the consent of the League. Furthermore, the size of the German navy was drastically reduced to six small battleships, six light cruisers and twelve destroyers. Germany was forbidden to maintain any submarines or military aircraft or to manufacture and use poison or other gases; nor is Germany allowed to send any military, naval or air mission to any foreign country nor to permit any such mission to leave her territory. The other parties to the treaty undertake not to engage any German in their military establishments. Similar drastic provisions were imposed on Austria, Hungary and Bulgaria.

Although these provisions represented the most ambitious effort that had yet been made to reduce and limit armaments of all kinds they omitted to limit military expenditure. Consequently the German government in 1928-29 was spending 769 million marks upon an army of 100,000 men as compared with 1948 million marks spent in 1913 upon an army of 842,000 men. The result of such expenditures was to give Germany a highly skilled professional army, which according to some military observers was more proficient, man for man, than any conscript army in Europe.

In order to enforce these restrictions the peace treaties provided for the establishment of interallied control commissions with powers of inspection to see that Germany actually reduced its military establishment. Apparently the intention of the treaties was that these control commissions should be dissolved as soon as reduction took place. But according to article 213 of the Treaty of Versailles the Council of the League of Nations, acting by majority vote, may investigate the armaments in Germany so long as the treaty remains in force. The activities of the interallied control commissions

aroused intense resentment in Germany, and following the establishment of a plan by the League Council in 1924 whereby a commission of inquiry may be sent into any of the four countries bound by the disarmament clauses upon the demand of any member of the League the Allies agreed to abolish the control commissions. These bodies were withdrawn from Germany in January, 1927, and from the remaining countries during the next few months. Germany undoubtedly prefers the intermittent inspection of the League (which apparently has not yet been resorted to) to the continuous inspection of an exclusively interallied commission. Nevertheless, doubts have been expressed as to whether the League of Nations should attempt to enforce disarmament provisions imposed by one group of powers upon another as a result of war.

So long as the Allies maintain large armaments the German government has no incentive to live up to the disarmament provisions of the peace treaties. Whether or not these provisions have been evaded as in 1808, nationalist sentiment in allied countries has used the suspicion that such evasion is taking place as an argument in favor of maintaining a large military establishment. German opinion, on the other hand, has been antagonized because the Allies have so far failed to disarm. According to part v of the Treaty of Versailles the armaments of Germany were reduced "in order to render possible the initiation of a general limitation of the armaments of all nations."

While the leading governments have expressed a desire for disarmament they have invariably contended that they cannot disarm until their neighbors do so. Otherwise they might be exposed to attack from a greatly superior force. While this argument may have some validity so far as the relation of one great power to another is concerned, it is clearly impossible for a country as small as Belgium or Denmark, no matter how much it strains its resources, to develop military strength equal to that of a powerful neighbor. According to the view of some observers it is to the interest of such small powers not to attempt to maintain armaments but to trust their independence to political guaranties and international organization, thus giving evidence of an earnest desire for peace. Such arguments were responsible for the passage of a bill which provided for nearly total disarmament by the lower house of the Danish parliament in the spring of 1926. Oppo-

nents argued, however, that even though Denmark could not maintain an army as powerful as that of rich neighbors, nevertheless in time of invasion an inferior force would be better than no force at all. Moreover, certain foreign commentators declared that as a member of the League Denmark was bound to assist in the carrying out of articles x and xvi of the Covenant and therefore should not reduce her armaments except in connection with a general international reduction. These latter arguments prevented the passage of the bill by the Danish senate. Nevertheless, it is interesting to speculate as to whether or not in time of war the population of a country as small as Denmark would not be better off if it made no military resistance to an invader but merely followed a policy of passive non-resistance similar to that applied by Gandhi and his followers against British rule in India.

DISASTERS AND DISASTER RELIEF. The functioning of society is from time to time disturbed by such occurrences as pestilences, floods, fires, famines, storms, earthquakes, volcanic eruptions and large scale industrial accidents. Property is destroyed and lives are lost in such disasters, and there are social complications of peculiar character. The study of such disasters has begun only recently and little of conclusive character can be said about them. In a sense wars, or more properly some of the particular incidents of war, are similar disasters, but there essentially different problems are involved.

Man's view of the causes of disasters has undergone several historic changes. In early times it was widely believed that demons or deities caused them, and such theories survive in

the legal phrase "act of God." The ancient prophet and sage was often called on to explain to his ruler and people the cause of such anger and to advise how repetitions might be avoided. Propitiatory sacrifices were offered, flagellation and vows undertaken. Such interpretations were made throughout the Middle Ages and today are held in some regions or strata of civilized society. Some nineteenth century Malthusianists considered disasters necessary to prevent the multiplication of man beyond the limit of his food supply, a theory which has an interesting counterpart in recent arguments presented by scientists that plagues operate in this way among wild animals. Modern sciences, particularly epidemiology, seismology and meteorology, have contributed knowledge of the natural and physical causes of disasters and have led to a new attitude which regards disasters as a problem to be approached scientifically.

The principal epidemic diseases are malaria, influenza, cholera, plague and smallpox. Plague alone is known to have assumed pandemic proportions three times: during the reign of Justinian; in the fourteenth century, when it was called the Black Death; and in the last decade of the nineteenth century. War is accompanied by outbreaks of whatever disease may have been indigenous among the civilian population. The introduction of non-immunes into infected territory, intense congestion, absence of sanitary safeguards, severe economic stress including exposure and starvation, combine to give rise to epidemics. Famines are always associated with typhus, relapsing fever and malaria.

Disastrous floods are caused by the breaking of dams, by cloudbursts, by sudden melting of snow and ice or excessive precipitation over a considerable portion of a watershed. The monsoon rains of the Asiatic interior reach China in late summer, and millions have perished in the floods of the Hwang Ho and the Yangtze River. Heavy crop loss caused by floods may result in famine. In the United States floods are most common in the Mississippi valley and occur in winter and spring. The Mississippi flood of 1927 affected seven states and covered 26,000 square miles.

The principal destructive storms are tropical cyclones and tornadoes. The former are peculiar to five regions: the West Indies, the Gulf of Mexico and Florida; the China Sea, the Philippine Islands and Japan; the India coast both on the Bay of Bengal and the Arabian Sea; east of Madagascar; and east of Australia near Samoa

Among the most destructive tropical storms were that which demolished Galveston in 1900, that which affected Porto Rico and Florida in 1928 and that which swept Santo Domingo in 1930. Tornadoes are the most violent of all storms. Completely destructive wherever they touch the earth, they are peculiar to the Mississippi valley and the southern United States. In the past ten years about one hundred have been recorded.

There are two great zones in which earthquake and volcanic eruptions are probable: one outlined by the Alps and Mediterranean, the Caucasus and Himalayas; the other surrounding the Pacific Ocean, following the Cordilleran mountain system and the festoons of islands on the borders of eastern Asia and Malaysia. Earthquake shocks occur with little or no warning, like that in 1923 which cost Japan 200,000 lives. Submarine earthquakes may cause destructive waves of excessive height. Although volcanic eruptions do not usually cause great loss of life, that of Vesuvius which buried Pompeii and Herculaneum is epic; and in 1815 Timbora, a supposedly extinct volcano in Java, is said to have caused the death of 100,000 persons.

Famines were once common throughout the world and still occur from time to time, particularly in economically backward areas such as India, China and Russia. The most frequent cause is crop failure, due to drought, excessive rains, untimely frost or insect pests. In some cases they have been aggravated by an economic system which strips a wide area of necessary reserves or interferes with importation. War may produce famine directly through the destruction of standing crops and reserves or indirectly by blockades and sieges. Temporary and localized famine is often a complication of other disasters, as when earthquakes and volcanic eruptions destroy food stores and the arteries of transportation or when plagues cut man power and food production.

The effects of disasters have been little studied and are difficult to summarize; it is especially hard in the present state of knowledge of the subject to differentiate accurately between the effects of catastrophic and long drawn out disasters. Where a disaster does not wipe out the social organism at one blow, as it presumably did in the case of Pompeii, there seems to be a fairly high potential of economic recovery, especially where assistance may be had from neighboring regions. Often, especially where a wide area is affected, there ensues a period of

economic and social instability characterized by fluctuating prices, shift of class lines and movement of population. The shock of disaster often produces unusual or extreme types of human behavior. On the one hand, acts of heroism, altruism and a strong sense of mutual dependence and obligation are called forth and, on the other, there are exhibitions of unusual greed and depravity. Long drawn out disasters, such as the Black Death and other plagues, seem to result in widespread unbalancing of manners and morals; the aftermath is characterized by social unrest, profiteering, unproductiveness, extremes of debauchery, extravagance, avarice, sexual looseness, hysteria and insanity. The desire to fasten blame for the disaster has sometimes led to the persecution of alien or suspect groups in the community. The relation of disasters to pessimistic philosophy and religious skepticism has its classic illustration in Voltaire's *Candide*. Sometimes the occurrence of a disaster is utilized to stimulate emotions and demonstrations of group solidarity, as when the Italian earthquake of 1928 was made a mobilization point for national effort and a stimulus for emotions of national solidarity directed to ends far beyond the repairing of disaster damage, or when the Black Death became the occasion for wholesale Jewish persecution and eviction.

The emotions stimulated by disasters, combined with the opportunity to rebuild along new lines at a cost no greater than that of duplicating what has been destroyed, have resulted in various reforms. More directly such significant institutions as the English Poor Law of 1586, government relief works and in part the English corn laws were outgrowths of disasters which came to play a crucial role in subsequent history. Careful town planning, including the laying out of parks and the abolition of slums, has followed several disasters. Even political reforms have come about; in the stress of the Galveston flood the commission plan of municipal government was given its first trial with such success that it spread to many other American municipalities. After the Tokyo earthquake of 1923 experts in town planning, municipal government, social work and the like were called from all parts of the world to aid in rebuilding the city along improved lines. Governments collapse, sometimes with the assistance of subversive elements; ordinary authority ceases to function and new leaders take power. Where the stabilizing influence of outside regions unaffected by the disaster is brought to bear, recovery is generally at-

tended by political restorations; but such disasters as famine, especially where long continued warfare has contributed to bring it about, frequently result in basic social change and even in revolution. Indeed, famines are sometimes utilized if not created as instruments of policy in social conflict. This is the case in a successful wartime blockade and was so in the advocacy of enforced famine by anti-Communists during the early years of the Soviet Republic. The employment of sabotage tactics may involve the same principle.

As social problems disasters involve a double task: prevention or control, and relief after the occurrence. Prevention and control have long received attention from state and private agencies, and although handicapped by the fact that each new disaster occurs under conditions peculiar to its geographical region have had increasing success as the methods of applied science have improved. The work of epidemiologists and sanitarians, supported by public health measures, is effective in epidemic control, although there is not yet assurance that malaria, plague, cholera, influenza and smallpox may not again assume epidemic or pandemic proportions. Improved agricultural, storage and transportation methods have eliminated famine from most parts of the world. Floods may be guarded against by the building of dams and reservoirs and by preventive forestation. Floods, tropical cyclones and tornadoes can be predicted by meteorologists, and weather bureaus are equipped to warn those in danger. Annual fire loss has been reduced as municipalities have improved their fire departments and established building regulations. Government assistance has reduced danger from forest fires. Although earthquake prediction is still uncertain seismologists have made contributions to the establishment of such a science. In storm or earthquake regions city codes favor the use of types of buildings less likely to be destroyed. In rebuilding after an earthquake lines of fault may be avoided for business and residential sections and used for parkways. Floods may be somewhat controlled by means of levees, reservoirs, dredging, spillways and flood ways. Although it is possible to carry insurance for almost any type of disaster loss, hazards are seldom so great that it is considered feasible and consequently few are protected in this manner.

The attitude toward the problem of relieving sufferers and repairing damage has been different at differing stages of social development. In

the antique and mediaeval worlds, when the distribution of grain was regarded as a matter of public concern, the state normally undertook relief, at least in so far as the problem of food was involved. Where public granaries existed surplus supplies were made available by the state for the relief of the stricken areas. Sometimes military forces were dispatched to the scene of the disaster to maintain order and assist in relief or reconstruction.

The development of modern economic and political theory resulted in a change of attitude toward the problem of disaster. Aside from the effects of Malthusianism, which tended to accept disaster as a necessary evil, the shifting of responsibility for economic welfare from the state to the individual diminished considerably the sense of public concern; it was easy to take the view that the sufferers might have avoided their difficulty if they had taken proper precautions. Since the distribution of grain was no longer a matter of public policy there were no public stores which the state might dispose of, nor were public funds readily available for medical or other relief. Private individuals who had stored grain had done so with a view to future commercial possibilities and were anxious to realize this profit rather than to relieve sufferers at their own cost. Such an attitude was particularly strong where the sufferers differed either in religion or in nationality from those who might potentially give relief. Although it remained customary for Jewish communities and other special groups to provide relief from communal funds for disaster victims, even in distant places, who were bound to them by particular ties, in general older views of obligation were being abandoned.

The development of humanitarian thought and the growth of a new wealthy class possessed of considerable sums of mobile capital combined to create a new method of relieving disasters. Along with other philanthropic developments it became common for wealthy individuals to provide large sums for disaster relief, and such funds were supplemented by smaller contributions. Especially is this true in recent years when high pressure campaigns have been conducted, bringing the apparatus of publicity and propaganda to bear and exploiting among large masses the strong emotional appeal of a disaster. The development of a scientific approach in social work makes clear the fact that disaster relief cannot be a simple process of sharing between a community with a surplus and one in dire tem-

porary need. With great sums of money, however, and a large personnel involved disaster relief shares some of the unfortunate characteristics of any great human undertaking. Sometimes secondary political considerations play a role in the work of organizing and distributing relief. Organizations may permit racial, religious or political criteria to influence their distribution of relief funds. Disaster relief sometimes is made a vehicle for propaganda. Famine relief in Soviet Russia would, it was hoped by many of its supporters, help to win the Bolsheviks or their followers to a new view; in the campaigns for funds for famine relief in India and China it has often been urged that such relief would advance the interests of Christian missions in the Far East; it has been charged that famine relief for the Jews of eastern Europe undertaken by American and west European Jewry has been attended by a more or less concealed effort at remolding traditional attitudes along new lines. Inside the relief organizations personal, political and social ambitions and interests find expression, sometimes with the result of great loss in efficiency; but in spite of these drawbacks the situation of individual sufferers in a disaster cared for by a large philanthropic organization using scientific methods is infinitely better than it has ever been before.

The trend of private disaster relief has latterly been toward the centralization of organizations and the establishment of permanent relief bodies. The Red Cross movement, organized in 1864 to aid war sufferers, has undertaken peacetime activities, one of the chief of which is disaster relief. In this movement there are sixty-seven national societies, the international Red Cross organizations, a staff of medical and other technical experts and mobile reserve funds available for quick distribution. During and after the World War there arose such organizations as the American Relief Administration, the American Committee for Devastated France, the Near East Relief, the Friends' Council for International Service, the Jewish Joint Distribution Committee and the Workers' International Relief (a Communist body which regards its work as military rather than charitable). Through all of these, orphanages, schools and hospitals have been established and provisions made for suffering refugees. The International Relief Union, proposing to replace wasteful and confused relief methods with a unified program, is in process of formation under the auspices of the League of Nations. Such institutions are

equipped to conduct effective campaigns for voluntary contributions to meet relief expenses and to procure trained and efficient personnel. They are supplemented by churches, lodges, clubs and similar organizations, which appeal to their own membership for funds, for general relief or for the relief of particular groups.

While the state has shifted fundamental responsibility to private individuals, most governments assist relief work through the loan of equipment, troops, technical personnel and sometimes even financial contributions. Such government cooperation is often of extralegal character, reflecting an official reaction comparable to that of the private individual rather than a sense of state responsibility. This fact along with the development of an international organization under League auspices might be an indication of a return to the older attitude. As a matter of fact, disasters have on the whole tended to deflect state attitudes from a course consistent with *laissez faire* theory. The appeal of a disaster to the emotions is so compelling, the social dangers involved so great, so obvious and so dramatically presented that the most anti-paternalistic states have in a sense been manoeuvred into adopting paternalistic if not socialistic policies as a result of disasters. When the British crown took over power in India in 1858 it substituted a policy of *laissez faire* for the commercially motivated famine fighting policy of the East India Company, but by 1873 the state was importing food for famine relief. Since the Famine Commission Report of 1880 the state has accepted responsibility for preventing starvation, leaving to private charity the care of other less basic needs. Scientific and intelligence staffs, relief workers, food purchase funds and distributing machinery are provided by the state. Disasters have tended on the whole to increase the distance between political theory and reality and to drive into the modern state another wedge through which paternalistic attitudes may enter.

Increased interest in social control in recent years has provided a technique, which is still imperfect but evolving, for handling the problem of relief. The work of relief involves a number of technical and social problems, for many of which no satisfactory solution has yet been found. There have been differences of opinion in regard to the advisability of the distribution of money or goods and in regard to the principles of indemnity for loss, equal distribution or relief according to need. Experience has

shown that the best results follow the giving of relief on an individual basis and of a kind and in a manner indicated by a study of individual needs. Sometimes employment on special public works is resorted to as a means of enabling sufferers to earn relief, a system prevailing especially in India. In any case, immediately following a disaster there is an emergency period when it is necessary to supply food, clothing, shelter and medical care as expeditiously as possible, usually upon a group basis. The restoration of normal conditions can be best approached through a program of family rehabilitation on a social case work basis with the needs of the family the determining factor. Such a program may include the construction or repair of homes; the restoration of small businesses; the provision of furniture, seed and livestock; long time medical care; legal aid, establishing trust funds for the vocational training of widows or young persons or giving support during the minority of children; in short, whatever meets the needs of the individual affected by the disaster. It is deemed unwise to assume responsibility for social problems not caused by the disaster, although such problems are called to the attention of local organizations. It is not the practise to undertake the reconstruction of public or community projects such as schools, churches, streets or public utilities. Satisfactory family rehabilitation should make it possible for citizens to accept normal social and civic responsibility. Such a program requires the employment of trained and experienced personnel, the gathering of individual records covering social data, losses, liabilities and assets, reports of the progress of the work, a final report and strict public accounting of all funds received and expended.

DISCUSSION. As a social phenomenon discussion implies preceding or potential conflict. In this sense it is an instrument employed to resolve differences prior to overt conflict or a means whereby overt conflict itself is brought to resolution. More rigorously defined discussion is an orderly procedure of oral exchanges between participants involved in an immanent or social conflict, designed to resolve differences and permit joint action. In so far as discussion is utilized prior to overt conflict it may be regarded as an educational tool designed to establish harmonious relations between individuals and groups through the revelation of their differences. When used in this manner conflict is regarded in an anticipatory sense and to a certain extent is resolved once discussion has begun. The establishment of a group for discussion which includes two elements previously in a state of overt conflict brings into existence a situation similar to that prevailing within any group including variations of interest not in a state of overt conflict. That is to say, a bipartisan body for discussion and resolution of differences is essentially the same in function as a partisan body which by including a number of individuals inevitably must eliminate differences by discussion before even a partisan conclusion is reached.

Wherever parliaments, assemblies or committees exist, some form of discussion is utilized. Indeed, it may be stated that discussion is the recognized substitute for the use of force, coercion or arbitrary authority; to confer—that is, to discuss—is to grant that if any solution is found for a problem it will be one in which joint interests have been so far taken into account as to render absolute and arbitrary authority impossible. It thus happens that parliamentary or congressional bodies are representative of diverse interests; likewise, parliamentary committees are invariably constituted in such

manner as to permit representation of both majority and minority parties. The general assumption underlying all joint deliberative bodies is that the procedure of discussion (conferencing) will somehow lead to conclusions in which all valid interests are represented.

The orthodox conception of discussion, as simply stated in the above paragraph, has been radically altered during the past two or three decades. All forms of discussion procedure in common usage have been challenged by the advocates of so-called new or progressive education. These critics have pointed out that arbitrariness is not eliminated merely because participants meet face to face and exchange facts, experiences or opinions; this procedure, so the critics claim, amounts to nothing more than superficial homage to a naïve conception of democracy. The crafty chairman or the forceful individual is able to gain his way as easily in a committee as in a mass meeting. As a result of this criticism discussion has come to take on some of the aspects of a skill or device, if not a technique. As currently conceived, the orderly procedure of discussion involves a sequence similar to that of the learning process as analyzed in Dewey's *How We Think*. Those who now advocate the use of discussion as an instrument for resolving social conflicts affirm that the skilled leader of discussion or the chairman should be an educator rather than a person seeking followers. He should assume as his main function the tasks of maintaining relevancy in discussion, securing adequate representation of all involved interests, refining the contributions of participants and adhering to a consciously conceived outline of procedure or method.

Discussion considered from its methodological or procedural side may be viewed as involving seven distinct steps, namely: (1) an examination of the nature of the problem or situation confronting the group in order to ascertain that all participants understand the situation in relatively the same manner; (2) the discovery of the most important problem or aspect of problem in the total situation—ordinarily it would be at this point that the greatest diversity of opinion would arise; (3) the revelation of differences of interest, attitude, opinion, conception of fact, or of value—at this point devices intended to reveal differences without allowing the heightening of emotions are employed; (4) a reevaluation of interests, attitudes, opinions, conceptions of fact, and of values—the assumption here is that a candid confronta-

tion of differences leads naturally to modifications; (5) refocusing the isolated problem within the total situation as initially confronted—at this stage attention is directed toward a reconfiguration of the total situation in terms of the preceding discussion of the specific item or problem, to make sure that all participants view the problem in its realistic setting and to indicate the extent to which a restatement of the total situation is now necessary; (6) presentation of various steps which might, if acted upon, carry the group toward a solution of the problem and a resolution of differences with consideration of all possibilities of action which the group is capable of suggesting or inventing; (7) acceptance of an experimental program of action with the assumption that activities will alter the situation as a whole and that therefore the program of action together with its consequences is to be subject to subsequent review.

Discussion procedures approximating the above outline are being utilized by numerous types of conference groups, particularly those representing educational, religious, interracial and social work and industrial interests. At least one agency exists for the purpose of studying and promoting discussion as an instrument for social adjustment, and two institutions of higher learning offer courses of study purporting to train discussion leaders. Thus it appears that discussion as a social device rooted in educational theory and democratic philosophy is likely to become incorporated within the texture of various administrative techniques. Governmental bodies for the most part continue to utilize the method of debate and have not yet begun experiments with true discussion. Joint committees in industry consisting of representatives of employees and of management have begun such experiments but only in isolated cases.

In the foregoing analysis discussion has been spoken of as a device, tool or instrument with the intimation that it may develop a special technique, perhaps in the same sense in which pedagogy has a technique. With this development in view several theorists have proposed certain arbitrary standards of measurement for the results emanating from discussion. One scale of this sort suggests that a discussion procedure may produce results ranging from acquiescence to integration. The intermediate terms as proposed are assent, compromise and consent; in this scale of qualitative values it is assumed that acquiescence in a solution ac-

cepted but unchanged by discussion is the lowest form of conclusion, whereas integration, the social invention of a wholly new solution, represents the highest form of result or emergence. Integration is considered a creative mode of resolving differences since it not merely gives security to all interests but utilizes these very differences as the dynamic elements in an inventing, creating enterprise.

DISTRIBUTION. The central problem of distribution in economic theory may be defined as the analysis of the forces which under free exchange govern the division of the product of industry between those who perform different functions or supply different factors. The shares may, however, be differently distinguished: according to the contractual arrangements under which the proceeds are received, according to the persons receiving them and according to the underlying functions or factors which constitute the sources of the incomes. Thus there are contractual distribution, personal distribution and functional distribution. Although these distinctions are generally made in economic textbooks and may be useful for didactic purposes, the main body of economic theory has for a long time concerned itself with functional distribution only.

While quantitative studies of distribution were early made in connection with estimates of the national income undertaken by such exponents of political arithmetic as Petty, they must be considered, as Cannan called them, "a statistical accident rather than a contribution to economic theory." The beginnings of abstract study of distribution were made by the physiocrats, who were the first to use the conception of a closed economy based on free exchange. But Quesnay and the other *économistes* were mainly interested in distribution between "sterile" and productive expenses; between handicrafts and trade, the sterile occupations, and agriculture, the only productive employment; and between consumption, replacement of capital and increase of capital. Land rent was the only true net product. Turgot thought that wages were based on subsistence and justified interest both on general grounds of natural liberty and as the necessary supply price of capital funds.

By the time of Adam Smith the wage system and the administration of land on a commercial basis were well established, but the typical organization of business managed directly by capitalist entrepreneurs did not lend itself to the distinction of the shares due to capital and management. Thus it was natural that Smith should have distinguished three shares: wages, rent and profits, the last including the earnings of capital.

These shares are treated as the "component parts of price": their natural levels govern the natural price, since the latter must be large enough to cover them. In harmony with this approach rent includes the rental value of land in the hands of the owner and contractual interest is almost neglected, being treated as something which, if paid, comes out of profits. Consistency might seem to require that wages be treated as the reward of labor whether hired or independent. But while this concept is mentioned, wages are in the main treated as a contractual payment. The three shares are viewed as the incomes of three fairly well marked classes: laborers, landowners and capitalist entrepreneurs.

The "natural levels" of these shares are described in a fairly empirical fashion, attention being paid both to the general levels of wages and profit and to the differences between different occupations. Some differences in wages tend to equalize the "real attractiveness" of different occupations, others not. Wages gravitate toward subsistence, but may be maintained indefinitely

at a higher level by continued progress. Other shares are less satisfactorily explained.

With Malthus the subsistence theory of wages gained scientific support from his elaborately buttressed law of population. This theory was employed to demonstrate the helplessness of communist utopias based on equal distribution to raise the standard of living of the masses. Such leveling could only be a leveling downward. The law had more practical application, however, as a weapon against the prevailing poor laws with their indiscriminate outdoor relief, virtually resulting in an accepted system of subsidizing low wages. This system, Malthus held, could end by absorbing all the income of the richer classes without raising that of the poor. The latter, by their unchecked multiplication, were responsible for their own poverty.

With Ricardo value and distribution become the central problems of economics and are approached deductively. Yet the three shares are still determined by different principles. The Ricardian law of rent, credit for which must be shared with James Anderson, is the first great example of the marginal method, later to become the keystone of the entire Austrian system of economic theory. Rent proper is only that part of the payment to landlords which is due to the "original and indestructible qualities of the soil" as distinct from profit on capital improvements. Since land is subject to diminishing returns and graded from better to poorer, the rent of a piece of land is the surplus of its total product, when cultivated with the proper quota of capital and labor, above the increment of product secured by a similar amount of labor and capital applied at the margin where this increment is smallest and yields no rent.

Wages are basically governed by subsistence according to the "iron law," with some slight allowance for rising standards of living. They are proximately governed by the ratio between population and the amount of circulating capital available for wage advances. This proposition constitutes the basis of the "wages fund" theory. With wages thus determined and rent fixed on a basis which excludes it from marginal costs of production, profit is a residuum.

The historical prospects afforded by this theory are based on the assumption of an inevitable increase in population. With more mouths to feed, a larger amount of capital and labor is applied to fertile land and poorer soil is brought under cultivation; consequently the marginal yield of land declines. It is to be anticipated

therefore that rent will rise, wages will absorb an increasing portion of the remainder and profit will correspondingly decline. When the point is reached at which further accumulation ceases, more workers cannot be supported and the "stationary state" is reached.

Senior traced the distributive shares other than rent to a basis in ultimate human sacrifices, the "abstinence" of the capitalist taking its place beside the toil of the worker. Senior follows the Ricardian treatment of rent and wages but considers that increases of fixed capital may increase profits by increasing productiveness. Although he notes the economic function of government in affording protection as a basis of economic action and states that distribution is affected by human institutions, he does not develop these principles but occupies himself with the "natural" Ricardian laws of distribution conceived without reference to alterable human institutions.

With John Stuart Mill the Ricardian scheme is built upon, but modified by, the infusion of social and institutional material. Mill stated that the laws of production "partake of the character of physical truths," while "the distribution of wealth is a matter of human institution solely"; and he took account of laws of property (including "property in abuses") and inheritance, systems of land tenure and customary practises as affecting rents and wages and the distribution of ownership. He noted the possibility of varying the scope of property rights, found that "sacredness does not belong in the same degree to landed property" as to property in movables and argued that "when land is not intended to be cultivated no good reason in general can be given for its being private property at all." He observed that personal shares in distribution overlapped the threefold scheme of rent, wages and profits, thus affording the basis for the distinction between personal and functional distribution. Mill displayed a humanitarian interest in the future of the laboring class but stressed the difficulties of permanently raising their standard of living. Originally committed to the wages fund doctrine, he made his famous recantation following Thornton's criticism. He improved upon his predecessors by making the rate of profit depend upon the cost of labor and by distinguishing in profits the elements of interest, insurance and wages of superintendence. Yet the theoretical underpinning of Mill's analysis of distribution is still the same as that of the other classical writers; rent is the surplus over

marginal yield, wages are determined by the standard of living of the laboring people and profits absorb the residuum.

Among the contributions of the later writers in the classical tradition must be mentioned the doctrine of non-competing groups of Cairnes as applied particularly to wage recipients. Together with the wages fund doctrine, a partial rehabilitation of which he attempted, it suggested that in the numerous more or less segregated compartments of the economic system distribution is governed by relations of demand and supply. H. von Mangoldt's clear distinction between interest and profit and his treatment of rent as a surplus element which may be present in the other distributive shares were more integrally incorporated into distribution theory by Francis Walker. He distinguished between interest, which is due to abstinence, and profits, which are governed by the same principle as rent, and designated wages as the residual share while holding them governed by the wages fund principle.

The classical theories throw varied side lights on the interests of the different classes. Since with progress rents rose and profits fell, Smith considered the interests of landowners in harmony with those of society and those of capitalists opposed to progress. As rent signified to Ricardo an increasing impoverishment of society, his view of landowners and capitalists was the precise opposite of Smith's view. According to Smith labor produced all wealth and should in fairness be tolerably well provided for, while the shares of land and capital were deductions from the product of labor. On the other hand, capital was regarded, in a fashion characteristic of classical economics in general, as giving employment to labor, "setting it in motion"; and capitalist entrepreneurs were therefore considered the most progressive group in society. While the classical economists were personally humanitarian, this obviously finds little reflection in their theories of wages or of poverty.

The pessimistic trend of the classical economics was combated by Bastiat in France and by Henry C. Carey, founder of the "American school." Bastiat was an extreme individualist and Carey a believer in state action, but their views on distribution were alike. Both merged land value with capital, regarding it as the result of human improvements, and thought labor's share an increasing fraction of an increasing whole. Carey denied Ricardo's law of the trend from better to poorer lands.

While classical economists envisaged the division of society into classes and formulated principles in accordance with which national income is divided among them, the rigidity of their formulation precluded serious intellectual concern with the struggle among the classes for a larger share of the income. As to the justification of property and incomes based on property they were content with hypothetical history beginning with a primitive state of equality and tracing the accumulation of capital from savings made out of personal product. But their theories raised problems to which later thinkers offered a different answer, and which contained germs of doctrines that emphasized class antagonisms and class exploitation. A significant forerunner of the exploitation theorists, Sismondi, writing in the first quarter of the nineteenth century combated the hypothetical history of Smith, whom he followed in many matters of strict economic theory, with actual studies of the evolution of economic institutions, revealing much injustice and hardship in the development of property and of the content of property rights. He related distribution to overproduction in a theory strongly suggestive of the later views of John A. Hobson. The income from previous production pays for current production, and a lack of equilibrium may cause overproduction or underproduction. The share of profits and rent and the use made of it, in spending or saving, are important in determining whether or not an equilibrium can be maintained.

The first fully developed exploitation theory was given by Rodbertus, who built on the view that labor is the source of all wealth, the shares of the other factors being deductions from it which are to some extent justifiable. But he held that since the productivity of labor constantly increases and wages are limited by the iron law, labor's share is a decreasing one. The resulting inability to buy the whole product of industry explained the recurrence of overproduction and crises. Rodbertus, the Prussian landowner, was a liberal rather than a revolutionist; he proposed therefore a compromise system in which the decline of labor's share would be prevented without the abolition of the distributive shares accruing to property holders.

A more elaborate exploitation theory was developed by Karl Marx, that many sided thinker who combined Ricardian theory with historical and institutional economics. His theory of wages and profits is not based like that of Rodbertus on the simpler expressions of Smith but is essen-

tially an implacable carrying out of Ricardo's theory of value and distribution. The value of goods is the crystallization of the socially necessary labor time required for their production. The value of labor itself similarly determined is the labor time necessary to produce the worker's subsistence. If this represents half a day's work, the other half is appropriated by the employing capitalist as surplus value. Thus if the working day is long and the productivity of labor high, the capitalist wage system enables the capitalist to appropriate a part of the value the labor has produced and gives rise to a class struggle between labor and capital for the distribution of the surplus product. The ease with which appropriated surplus value may be accumulated and the competitive advantages of large scale production and capital investment lead to a concentration of economic power in the hands of a few and the proletarianization of the small scale producer and independent artisan. In this process an "industrial reserve army" of unemployed is created which tends to depress the condition of the workers to a level of inevitably increasing misery.

The chief logical difficulty of this theory arises from the fact that prices do not follow the labor time formula, because the relationship between fixed capital and the outlay for wages varies with industry and period. This difficulty has never been satisfactorily dealt with, despite numerous attempts following the posthumous third volume of *Das Kapital*. But Marx' theory is not simply a logical construction. Marx also finds historical bases for existing inequality in many acts of expropriation through the long history of the class struggle. Some later exploitation theorists, notably Franz Oppenheimer, fixed upon one of these acts, the monopolization of land in the hands of private owners, as the taproot of exploitation incomes.

The marginal theories of distribution were developed after Marx; their bearing on the doctrines of Marxian socialism is so striking as to suggest that the challenge of Marxism acted as a stimulus to the search for more satisfactory explanations. They undermine the basis of Marxian surplus value doctrine by basing value on utility instead of on labor cost and furnish a substitute for all forms of exploitation doctrine, Marxian or other, in the theory that all factors of production are not only productive but receive rewards based on their assignable contributions to the joint product.

The great forerunner of marginalism was von

Thünen. He broadened the concepts of diminishing and marginal productivity from the single case of land, which formed the basis of the Ricardian rent doctrine. He did not, however, consider the marginal productivity principle a satisfactory basis for distribution but developed a theory of the "natural" wage, which should be a mean proportional between subsistence of the laborer and total product, expressed in the celebrated formula: \sqrt{AP} .

The marginal theories, which reigned well nigh supreme among "orthodox" economists through the last quarter of the nineteenth century, insisted that value of products is not derived from costs but that costs, i.e. value of factors used, are derived from value of products. The problem of distribution is for that group of theories essentially a question of imputation; that is, of allocating the value of the product among the factors cooperating in its production. The methods by which this problem is solved vary with different writers. To Menger the per unit productive contribution of a factor is measured by the diminution of product resulting from the loss of a unit of the factor, while Wieser employed for the same purpose a system of simultaneous equations based on forms of production in which the factors were employed in different proportions. The marginal productivity theorists, notably J. B. Clark, equate the productivity of each unit of a factor to the addition made to the product by the marginal increment of this factor. One much neglected contribution is that of Stuart Wood (in *American Economic Association, Publications*, vol. iv, 1889, p. 5-35), who developed a form of productivity imputation based on competitive equivalence between labor and labor saving machinery at the margin of indifference. One point, obviously crucial to all marginal theories of distribution, is that the sum of the marginal contributions of productive factors must equal the total product. Wicksteed evolved a mathematical proof of this proposition but abandoned it on Edgeworth's criticism that the form of productivity function which it required was not plausible. This form of function was essentially static, involving no change in efficiency with change in scale of production.

The marginal theorists sensed a special problem in explaining the appropriation by the capitalists of interest on capital funds. Solutions were attempted by introducing a consideration relevant to the supply of capital funds, the tendency to discount future as compared with present

goods. Böhm-Bawerk combined with this an explanation based on the "technical superiority" of present goods as means to the utilization of the more productive roundabout processes, thus introducing a productivity element into interest theories. On these matters he had a forerunner in John Rae. Among later writers Fetter rejected all productivity elements and based interest solely on time discount. Irving Fisher discussed the assimilation of personal marginal time discount rates to the market rate of interest by the process of borrowing and lending as well as the influence of the shape of the income stream on the effective desire of accumulation. Schumpeter relegated interest to the realm of dynamic phenomena.

Marginal theories assume the persistence of essentially static conditions; also their central formula concentrates on forces operating from the demand side, supply being taken for granted. Forces governing supply are thus left for separate treatment. Only the mathematical theorists, who expressed in one system of equations the conditions of equilibrium for both products and productive factors, are able to make one set of formulae take account, even though in a severely abstract form, of supply as well as demand conditions. Marginal theories recognize, however, the existence of some phenomena produced by dynamic conditions. Such are entrepreneurs' profits and losses and surplus returns yielded by productive equipment not reproducible within a short time (quasi-rent).

The marginal approach has the notable effect of making possible a homogeneous theory of distribution: at least on the demand side all shares are governed by an identical principle. This group of theories, therefore, offers less reason for distinguishing between the various factors of production. The differentiation between land and capital is no longer necessary; in fact, some writers have designated as rent the specific shares of any tangible factor, while they used interest to describe the same share as a percentage of investment or capital value. For the same reason this approach makes possible classification of productive factors into an indefinite number so long as they are susceptible of marginal analysis. The share of government—taxes—has, however, never been fully assimilated to this unitary scheme of explanation.

In the hedonistic form of the marginalist theory "product" meant a social gain, a creation of utility. With the general abandonment of utilitarian psychology and the striving for some-

thing more realistic than the "benevolent abstraction" of the static state it has seemed to some that the product which governs rewards must be defined as anything that commands a price, with no implications of a social character. The principle of marginal imputation is naturally still applicable, but the dynamic standpoint brings into view imperfect markets, bargaining handicaps, cases where the minimal dose is large, organic wholes like Davenport's three-legged stool—in short, numerous departures from pure marginal equilibrium, until the marginal method itself seems in danger of being discarded. Pigou, however, still uses it as a powerful weapon for tracing discrepancies between private acquisitive standards and the maximizing of the "social dividend."

Any static or equilibrium theory must recognize the existence of bargaining and the effect of unequal bargaining power in actual practise in causing departures from static standards as well as the importance of many social forces not included in the formulae of economic equilibrium. But most theories of this type tend either to dismiss the "higgling of the market" as a negligible disturbing element not capable or worthy of receiving scientific study or to consider that it operates within fairly narrow limits set by such strictly economic factors as productivity. Bargain theorists, on the other hand, regard these forces as so decisive that they tend to neglect the conditions of abstract equilibrium as not having sufficient force and reality, even as a point of departure for market variations, to repay serious analysis. They treat the market not as a passive machine whose function is limited to the registering of results rigidly predetermined by the independent forces of supply and demand but as an institution whose behavior may itself have some influence on the result.

Early anticipations of modern bargain theories may be found in Sismondi. The importance of non-economic factors is brought out very clearly in the writings of Dühring, who insisted that the phenomena of distribution are better explained by reference to forces of political compulsion than to economic laws. Elaborating on Dühring, Tugan-Baranovsky formulated what he calls a "social theory" of distribution. He maintained that the buyer and seller in the market for productive factors do not meet each other on the basis of equality and that the relations between them are basically conditioned by a number of non-economic factors, a situation which does not obtain in the market for final

goods. This distinguishes the problem of distribution from that of value and price. Among American writers the effects of property and contract in their varying specific forms on production and distribution were traced at length by Ely and in a different way by Commons, while coercive elements in the economic system are stressed by Commons and R. L. Hale. In his "functional" theory of wages W. H. Hamilton translated the elements which are dealt with by the institutional and bargaining theories as well as by the equilibrium theories into a list of specific variables which influence the rate of wages.

In this group belong also a number of doctrines developed outside of the domain of strict theory. Such for instance is the view that trade unions bettering conditions in a limited field help unorganized labor by setting standards which will tend to spread rather than injure it by limiting access to the favored field and leaving other fields overcrowded. Another example is the theory of Sidney and Beatrice Webb that businesses paying wages too low to maintain labor in a state of efficiency are parasitic, laying the burden of necessary maintenance on other industries. Akin to this is the doctrine that a legally fixed minimum wage which the least efficient employers cannot pay is not necessarily a violation of economic law, since it merely hastens and strengthens the process of economic selection by transferring business and workers to more efficient employers.

The recent theories of high wages offer a peculiar reversal from the institutional point of view of some of the older doctrines. Thus the view that high wages may sustain themselves by causing increased productivity makes productivity the effect rather than the cause. Another example is found in the doctrine recently enunciated by the American Federation of Labor and adopted by progressive business men. In a fashion somewhat reminiscent of Rodbertus it regards high wages as essential to the prosperity of business: they offer the means of sustaining purchasing power necessary to absorb the output of modern mass production. This doctrine calls for the relaxation of exploitation in the sense of the nineteenth century exploitation theories, and assumes that business men may act in the interest of business as a whole rather than in the single interest of their own concern.

While distribution theories deal primarily with the forces which govern the division of the national product, inductive studies of income

distribution aim in a majority of cases at the determination of the proportions in which income has been distributed among groups classified by size of income. The two types of study have therefore little in common except that generally labor incomes will be found in the lower income groups and property incomes in the upper. Even the national dividend in the two types of study is not exactly the same, since quantitative studies limit themselves as a rule to realized income only.

A number of quantitative studies have also been made of wages and profits in different industries and countries. Some of them, such as H. L. Moore's analysis of wages in France (*Laws of Wages*, New York 1911), have represented attempts at inductive verification of distribution theory. Others have had as their goal the ascertainment of trends in wages or profits. The results of these studies in so far as they bear on the amount of income from labor relative to other shares do not corroborate earlier theories of either a general upward or a general downward tendency; they indicate rather a considerable degree of stability.

The quantitative studies most relevant to the purposes of this discussion are those differentiating national income by functional shares. Such studies, few in number, have been undertaken only recently and the results obtained have not so far been very significant. The chief difficulty with which such studies must contend is that the available material does not allow the segregation of income by abstract economic functions. Thus American studies of farm incomes have habitually deducted 5 percent on the value of land and capital and reported the remainder as the farmer's labor income. This remainder was usually astonishingly small. But the rate of 5 percent appears arbitrary as applied to land, because in sections that were marked by rising land values farmers were buying land at prices representing much lower rates of capitalization, and were virtually taking part of their return in the appreciation of their investment so long as that appreciation continued. In regions where a system of customary share tenancy or the crop-per system prevails quantitative records of farm incomes inextricably merge rent, interest, wages and profits and make impossible any exact Ricardian adjustments. Corporation reports furnish difficulties of their own, although the requirements of reporting income for taxation have to some extent standardized the form of the report. The lack of uniform practise in

accounting for capital makes the rate of return on investments a matter of estimate, and the practise of investing surplus funds in other industries makes the exact nature and the source of the income difficult to trace.

The limitations of such distribution studies are clearly exemplified in the estimates of national income made by the National Bureau of Economic Research in the United States. These estimates make the best of the refractory material available, classifying it according to industrial groups and differentiating three functional shares: wages, salaries and income from entrepreneurship and property. The concept of income employed is that of "realized income," received by individuals from industry. This conception of income yields a highly significant figure but not the one figure most logically adapted to the requirements of all possible problems. Taxes paid by business are deducted; those paid by individuals are not. Corporate savings are left for separate estimate, with the result that in manufacturing, for example, wages and salaries averaged over 80 percent of the total realized income received by individuals from 1909 to 1925. For industrial groups as a whole from year to year amounts invested by the corporations are shown to have little or no relation to changes in the market values of the corporations as going concerns. This does not, of course, dispose of the question whether such investments have an effect in maintaining the values of the concerns over long periods.

The quantitative analysis of the functional distribution of income is still in its infancy. Improvements in data and developments in methods of analysis should yield in the future increasingly significant results.

DITHMAR, JUSTUS CHRISTOPH (1677-1737), German economist. When Friedrich Wilhelm I of Prussia created the first two German chairs of *politica, oeconomica und cameralia* in Halle and in Frankfort on the Oder in 1727, Dithmar became the first incumbent at Frankfort. The king believed that the landowners should be taught the principles of true economy and the young civil servants trained in the fundamentals of administration and public finance. Dithmar, who was a historian of erudition but a person with little practical experience, was not entirely fitted to carry out these intentions of the king. He was quite competent, however, to offer a description of the technical and legal aspects of current Prussian administration and finance. In his *Einleitung in die ökonomischen, Polizei- und Cameralwissenschaften* (Frankfurt a. O. 1731; 6th ed. by D. G. Schreber, 1769) he took for granted the need for the new science and defined its scope as the teaching of "how wealth may be acquired, how acquired wealth may be retained or employed with moderation to the honor of God." Dithmar is also known as the founder of the first magazine devoted to economics, the *Ökonomische Fama*, of which ten issues were published beginning in 1729 (reprinted Frankfurt a. O. 1743).

DIVINATION is essentially a method of arriving at a judgment of the unknown through a consideration of incomplete evidence. Accurate observational science, which is present to some degree in all human societies, offers one method of discovery and of anticipating developments.

But in no society is science adequate to facilitate judgment of all the unknown matters that it is desired to prejudge or to know. Everywhere therefore systems of divination are employed in addition to careful empirical observation which welcomes test, which takes negative instances into consideration and which is adjusted to probabilities empirically reckoned. Because in all primitive and ancient societies most systems of divination which ignore scientific ideals are connected with the sacred, the term divination is sometimes used in a restricted sense to refer exclusively to the occult. This use is possible only because exact correlates of contemporary systems that dispense with claim of sacred validation, such as gamblers' systems or the psychoanalytic determination of the mental processes of infants, are not known in primitive society. When North American Indian medicine men diagnosed the ills of newly born infants by avowedly holding private communication with them, the ability to hold this communication was ascribed to supernatural inspiration. This distinction between divination based on the unaided human reason and that based on human reason aided by supernatural power is a widespread conventional distinction closely corresponding to the use or disuse of scientific ideals.

In spite of this difference in formal classification of types of divination a system of occult divination may conform more closely to the ideal requisites of scientifically valid judgment than a system of secular divination avowedly non-sacred. Much depends on what is believed to be ascertainable by sacred divination and to what degree the judgment of the diviner is confined by the artificial system of his craft. In the Manus tribe of the Admiralty Islands, the diviner, the medium and the seer are all employed to divine the sins that their fellows have committed. They unearth by efficient observation and judgment many sins unknown to the general community and by using their fellow tribesmen's confidence in their supernatural power to obtain secret information they extort a confession from the sinner whom they have good prior ground for suspecting. Dreams of the seer, apparently possessed utterances of the oracle, an itch in the back of the diviner, are the material of divination. But dreams and utterances are judiciously interpreted, and whether an itch is felt on the left side or on the right side of the back of a diviner depends on what the diviner believes about a suspected sin. In the Dobuan tribe of the D'Entrecasteaux Islands,

where divination by water gazing is used to discover sorcerers and witches, the water gazer detects persons who had real cause for quarrel with the person supposedly bewitched and consequently had actually engaged in sorcery or witchcraft. Diviners among the Manus and the Dobuans engage in a most dangerous profession if they are not correct as to facts; but as long as they are accurate they ply their trade without danger.

Dreams, avowedly inspired utterances from ghostly or godly possessions of a medium, itches, twitches, sneezes or other involuntary movements in an oracle's body or, supposedly or really, in a corpse or in the bodies of the bearers of a corpse and gazing in water or crystal or looking glass are methods of divination of such wide distribution that a single origin can be inferred. There are a prodigious number of methods of divination limited to local distribution.

A distinction must be made between discovery divination, used to detect guilt, and prediction divination, used to forecast luck in connection with proposed action. Prediction divination methods are used in such a manner that there is no possibility of a test of the diviner's fiat. The diviner forbids or permits action; and although the allowed action may be found unlucky, this offers no direct check on the possibly more disastrous results of the prohibited action. Omens from the flight of birds or direction of travel of animals have universal distribution. Divination from the appearance of the internal organs of sacrificial animals, from the stars or in connection with the calendar occur both in the Americas and in the Old World. Divination by casting of lots was widely distributed in the Old World, and gambling had a slight divinatory character in the Americas. These methods of prediction divination, as opposed to the methods of discovery divination, permitted less freedom for the exercise of the diviner's judgment. In some places, however, the thrower of lots might be his own arbiter as to the point at which he ceased throwing and gave his oracular decision.

Ordeal is allied to discovery divination. It may be contrasted with the latter in that it takes advantage of the qualms of the person under ordeal to extort confession; discovery divination depends upon the judgment and detective work of the diviner.

Social organization enters in determining the nature of divination. In large parts of democratic Oceania discovery divination by professional diviners is constrained by some need of

selecting according to actual guilt. In Africa the diviner may be bribed or his judgment may be determined by autocratic constraint. In North America the sorcerers may also be the diviners. They are generally associated in societies and do not divine against their own society interest. Among the Menomini Indians, however, the diviner is pitted against the sorcerer.

In the civilizations of Europe and Asia discovery divination and ordeal do not figure as prominently as in the primitive world. Religious persecution functioned less impeded by the constraint of the occult. New adaptations were used for discovery divination, such as apparently inexplicable movements of a suspended Bible; the opening of a book of Vergil or of a sacred book at a chance passage was used for prediction divination. In ancient Assyro-Babylonia there was extensive professionalism in prediction divination; in Greece there was the oracle at Delphi; in Rome and in Egypt there was very little professionalism. The Roman method of divination was the drawing of lots, the *sortes*, and the use of bird omens; the Egyptians divined from fancied movements in the statues of god kings. In Mongol civilization divining by appearances in the shoulder blade of a deer or a sheep was widely performed by priests. Prediction divination by the sacred books survives in Europe and in India and the older methods are still found in peasant communities. In modern spiritism the emphasis is less on prediction divination than on supernormal communication for its own sake.

The development of political organization did not everywhere weaken the position of professional diviners. The state officials in Rome often did their own divining to prevent outside interference in state policy. The oracle at Delphi generally avoided political partisanship. In Indonesia and Polynesia the professional diviners' advice was important in war.

DIVINE RIGHT OF KINGS. The theory of kingship to which the phrase the divine right of kings properly applies must be carefully distinguished from one or two other political concepts in some respects similar. It is not the same as the belief in the divinity of a monarch such as is found among the Greeks of the Hellenistic period or in the Roman Empire before Christianity became the established religion. Nor is it identical with the theory of the divine origin and authority of a king's office which was held practically universally throughout the Middle Ages and persists in modern times in parts of the world. In some important respects it must be distinguished even from the legitimism which became the central idea of the French monarchy with the accession of Henry IV.

Under the theory of the divine right of kings the monarch is not in person divine, but he does enjoy and exercise a personal right to rule in virtue of his birth alone and not of his office, a right based not merely upon national and customary law but founded in the law of God and of nature. Under it no king *de facto* can have any legitimate authority: all true kings must be kings *de jure*; under the law of God and the law of nature they succeed by heredity alone to the rights of their ancestors, who in the beginning were divinely appointed to rule. They are never the creatures of the people, their authority does not come from the people's law, and their powers are not derived from their predecessors in the royal office but from their ancestors alone.

This peculiar theory is found in varying forms, such as that of James I of England, who traced his rights to the "conquest" made by his ancestor William I, which he distinguished from a usurpation; or the patriarchal theory of Sir Robert Filmer, who essayed to derive the rights directly from the early Hebrew patriarchs. The idea common to these theories is that of a personal and hereditary right of divine institution.

Such an idea has few roots in the Middle Ages. In the eleventh century Peter Crassus

put forward such a personal claim in defense of the Emperor Henry IV, but he based it mainly on Roman not divine law. In the Middle Ages generally royal authority was believed to be of divine origin and sanction, but it inhered in the king's office and not in his person. The divine rights of kings is a modern and not a mediaeval theory, and it is not the only modern theory of monarchy nor even the typical one. In France, for example, notwithstanding the arbitrary character of the personal monarchy of the Bourbons, the words of Philippe Pot in the Estates of 1484 were still accepted in theory: "The kingship is a dignity and not an inheritance." As Adam Blackwood put it (c. 1580), kings "are the heirs, not of kings, but of the kingdom."

In fact, it is in England that the widest acceptance of this particular doctrine of monarchy is to be found, and by only a minority there except for the brief period between the execution of Charles I in 1649 and the revolution of 1688-89. Before the outbreak of the civil war the theory was held by very few. It was mainly the reaction caused by the execution of the king that led to its wider extension among the royalists, and after the Restoration it became the central theory of the Tory party. This seems a truer explanation of its vogue than that of Dr. Figgis, who attributed it chiefly to reaction against the Jesuit theory of the indirect power of the pope in secular government.

But even in England the theory was short lived: the arbitrary rule of Charles II and James II killed it. The end virtually came at the revolution. Thinning numbers of Jacobites and non-jurors continued to adhere to it until the middle of the eighteenth century, and probably even now a few romanticists who hold it may be found. But all life really went out of the doctrine of the divine right of kings at the accession of William and Mary, whose tenure depended on no personal right, divine or other, but solely on the vote of the representatives of the people of England.

DIVISION OF LABOR. See SPECIALIZATION.

DIVORCE, or the formal dissolution of marriage, is in any society a corollary of the theory and practise of marriage and a direct measure of marital stability. It is designed primarily to relieve the hardships imposed in individual cases by the customary marriage rules. Its frequency does not seem to vary directly with any one feature of marital institutions but reflects the composite influence of all the cultural traits affecting the rights and duties of the sexes. Among primitive peoples customs differ widely. They frequently permit dissolution of marriage at the will of either party during the first days or months but hold it disgraceful when the union has endured for a considerable period, especially if a child has been born. In general, primitive mores require that husband and wife should not separate except for just cause, but such cause may vary from sterility or adultery to mere desire for novelty. Barrenness or adultery by the wife is a widespread but not a universal ground for divorce; in some cases impotence or adultery by the husband is held as a legitimate reason. Divorce of the wife is also permitted by different peoples on grounds of laziness, unskilful cooking, neglect of children, bad temper, disobedience, thievishness, suspicion of witchcraft, incurable disease, desertion and old age. Husbands may be divorced for laziness, neglect, ill treatment, bad habits and desertion.

As marriage is a form of cooperation between the sexes in race perpetuation and maintenance, economic factors deeply affect divorce at all levels of culture. Among primitive peoples it is notably true that individual happiness is secondary to practical considerations and among them frustration of economic cooperation shatters marriage. A wife who is costly or brings a dower tends to be valued and treated with forbearance. The difficulty of securing a return

of the bride price, the necessity of surrendering the dower, the cost of a new wife, the rules for the division of property and division and care of children or danger of a blood feud deter dissatisfied husbands from terminating a union. Dissatisfied wives are often strongly deterred because of the difficulties of self-support; they may also risk loss of dower or rights in common property or children. Religion and romantic sentiment play a slight role in the permanency of primitive marriage. Divorce customs always make provision for children, although in highly variable ways. Group solidarity sufficient to give force to community supervision and opinion may render divorce rare, because of public reprobation, even when theoretically easy.

In oriental cultures divorce has differed greatly in frequency, the differences of time and place often reflecting subtle rather than major cultural variations. Mohammedan tradition permits a man to have several wives and to repudiate them at will by a simple formula, but a wife may procure dissolution of marriage by mutual consent or by judicial procedure. Among the Arabs divorce is frequent but among the Mohammedans in India it is rare. Among Mohammedan Algerians divorce has long been from one third to one half as frequent as marriage, while among the Turkish Kirghiz the bride price is so high that monogamy is nearly universal and divorce infrequent. In Morocco a Mohammedan woman can divorce a man only by fleeing to another man's abode, while among the Bedouins of the Euphrates her rights of divorce equal those of her husband.

The new civil code adopted in Turkey in 1926 abolished polygamy and gave women equal rights with men in marriage and divorce. In addition to the usual grounds for divorce the law permits suit if either party has committed an act dishonoring the nation. Any decrease in the common property of husband and wife must be borne by the former in case the property is divided following divorce. In India divorce varies much from caste to caste. Orthodox Hindus permit no divorce but an adulterous wife may be made a slave in her husband's household. Some low castes permit divorce by mutual consent but such divorce is rare because of caste opinion. The Buddhists of Burma regard marriage as a civil contract to be dissolved for a variety of reasons.

Jewish law permits divorce by mutual consent and in addition allows a husband to repudiate a wife for good cause and a wife to secure

dissolution of marital bonds for bigamy, consanguinity, repeated ill treatment, gross immorality, neglect to provide, repulsive chronic disease contracted after marriage, or impotence. Before the World War the Jews of eastern Europe, especially in Russia, Poland, Austria and Rumania, followed the Jewish law in regard to marriage and divorce but they have become increasingly subject to the civil codes of the countries in which they reside.

Divorce is unusual among the Chinese. Women have traditionally almost no power of divorce but were divorced for the seven reasons laid down by Confucius: barrenness, lasciviousness, disregard of parents-in-law, talkativeness, thievishness, jealousy or aversion and continuous infirmity. A husband who keeps an adulterous wife is himself liable to punishment. Recent social ferment has tended greatly to liberalize ancient marriage and divorce customs. A Chinese provisional civil code was enacted in 1913, but because of the political situation in China it has never been authoritatively promulgated. Its regulations regarding divorce, however, are enforced in the native courts and may be considered the law of the land. The judicial grounds for divorce under this code are: bigamy, adultery of wife, conviction of husband of adultery, attempt upon life of spouse, cruelty, malicious desertion, absence without news for three years and ill treatment of kin.

Among the Japanese previous to 1898 the Confucian code prevailed, under which statutory provisions were vague and divorce frequent. The new code, promulgated in 1898 as amended in 1914, permits divorce by mutual consent and establishes the following grounds for judicial divorce: bigamy of either partner, adultery by the wife and adultery by the husband if he has been convicted therefor, conviction of husband of criminal carnal intercourse, sentence of either party for a serious offense, absence without news for three years, malicious desertion, grievous insult or injury and various minor grounds. Collusion or connivance debars divorce. Divorced persons may remarry but one divorced for adultery may not marry the accomplice. The number of divorces dropped sharply from 124,075 in 1897 to 99,464 in 1898 and to 66,626 in 1899. Thereafter the number declined almost yearly to 50,119 in 1926. There was a decrease from nearly three per 1000 population in 1897 to less than one in 1926.

Among all the early Aryan cultures divorce

seems to have been very infrequent, although custom accorded the husband freedom to repudiate a wife no longer attractive. In Greece and Rome women were under the perpetual tutelage of fathers and husbands, so that wives could be repudiated at will. Moreover, at Rome if the wife remained in the *potestas* of her father he could separate her from her husband against the wishes of both. Infrequency of divorce in early periods seems to have been due to the universal high regard for family stability and the requirement that the dowry be returned. Generally speaking, throughout ancient times divorce remained a private or at most a family affair little affected by religious or legal regulation. As a primary object of marriage was the perpetuation of family name and household gods, the repudiation of a wife for barrenness or even for her failure to produce male descendants was to some extent a religious and civic duty. Adultery by the wife was also an almost universally recognized ground for repudiation but adultery by the husband was not.

In Greece wives could secure divorce by mutual consent or in cases of gross neglect or cruelty by application to the chief archon, but they were restrained by economic and social considerations from frequent use of this right. Divorce seems to have been less common in Sparta than in Ionia, partly because children were viewed as belonging to the state and adultery for the purpose of insuring offspring was not only condoned but frequently encouraged. In Rome the frequency of divorce varied with the type of marriage. Whereas a wife *in manu* could be repudiated by the husband at will and those secured by *coemptio* or *usus* with little ceremony, a wife married under the sacred rites of *confarreatio* customary among early patricians could be divorced only with difficulty. Grounds for divorce included not only barrenness and adultery but the commission of a capital offense, wine drinking or the counterfeiting of keys. The rise of "free marriage" after 250 B.C. was associated with reduced paternal authority, increased female prerogatives and a rapid increase in the divorce rate. Concurrently with the increase of wealth and security women, especially in the upper classes, came to enjoy increased education, property rights and personal independence. They acquired a power of divorce similar to that of men and divorce by mutual consent or at the will of either party came to require little legal formality beyond the service of a *libellus repudii*, or notification

of intention to dissolve the union. In the later days of the republic and during the empire divorce was a commonplace occurrence; Cato, Sulla, Pompey, Caesar, Antony and Pliny the Younger, for example, divorced and remarried from three to five times. Various emperors, notably Augustus, sought to check the rising tide of divorce by laws imposing economic and social penalties. But marriage remained a contract under patriarchal rather than civil control and divorce essentially a private affair. Public opinion rarely supported the penalties for adultery, and the social forces of the imperial era rendered the laws ineffective. The decay of the patriarchal family at Rome has been variously explained. The rise of divorce, associated as it was with decline in marriage and birth rates, indicates a complete revolution in marital institutions. Contributing factors were the increase of wealth, luxury and slavery, involving a decline of simplicity and the domestic virtues and increased desire for a life of ease and sophistication; pessimism as to the civic merit attaching to parenthood, following the civil wars and proscriptions and the enormous influx of landless peasants and foreigners; and increased influence of oriental standards of luxury and sensualism, with which was associated the growth of prostitution and concubinage.

The western Christian church made both marriage and divorce difficult because of its doctrine that sex is inherently sinful. Marriage was made a sacrament and under the influence of St. Augustine became indissoluble. But the impossibility of forcing people to live together in the intimacy of marriage compelled the church to authorize separation from bed and board. Moreover, the numerous impediments to marriage enabled the church lawyers to find grounds for declaring any marriage invalid from the beginning provided plausible reasons whether personal, political or pecuniary could be brought forward. Catholicism has steadfastly maintained this traditional attitude. Papal canon law, which prevails in Italy, Spain, the Irish Free State and Austria (for Catholics) and among faithful Catholics everywhere, permits separations for adultery or unnatural offenses, cruelty, infidelity, impotence, entering into religion, and consanguinity. Incontinence before marriage discovered after marriage is one of several grounds for annulment of marriage. Recent studies indicate that numerous divorces in the United States are procured by persons of Catholic affiliation.

The Protestant reformers held that the severity of the traditional doctrine fostered immorality among the masses while maintaining relatively easy divorce for the rich and powerful, and they regarded marriage as a civil contract. All of them admitted the rightfulness of divorce on grounds of adultery and malicious desertion; some added excessive cruelty, insanity and incurable disease. Contrary to Catholic precedent they fully sanctioned the remarriage of the innocent party. In Protestant and Catholic communities alike, however, marriage continued to be surrounded in popular esteem with religious sentiments, and divorce was viewed with the dread attached to whatever is tabu. Secular views of marriage and divorce have won increasing acceptance since the French Revolution and have steadily been reenforced by the intellectual and industrial changes of recent times.

Aside from the Catholic countries above mentioned European countries present considerable uniformity in both grounds and frequency of divorce. The Orthodox Eastern church, whose canons long prevailed in Russia and Hungary and are still influential in Serbia, Bulgaria and Rumania, permits absolute divorces but not judicial separations. In the last three countries named the basic grounds for divorce are adultery, attack on life, serious maltreatment and sentence to penal servitude. Bulgaria also recognizes as grounds wilful desertion, absence without news or non-support for four years, impotency, insanity, epilepsy, idiocy, syphilis, unnatural sex congress, restraint of religious liberty, drunkenness aggravated by waste of estate or dissoluteness, persistent immorality and unsustained charge of adultery. Serbia recognizes as additional grounds absence without news for four years and apostasy. In Rumania divorce may be secured by mutual consent under special judicial procedure. Hungary recognizes the grounds common to the three foregoing countries, except apostasy, and adds bigamy, unnatural crime, malicious desertion, persistent immorality and inducing or attempting to induce one's own child to commit an immoral or criminal act. In Greece the Justinian code of the sixth century was given statutory authority in 1822 and 1835 and has remained in force. This permits divorce to the husband on grounds of his wife's adultery, staying a night in another house except that of her parents without his consent, attending theater or sports without his consent, attending

dinners or bathing in the company of men against his wishes, inducing abortion, attempting life of husband and failure to inform him of a plot against his life or of conspiracy against the government. A wife may secure a divorce if the husband conspires against the government, attempts her life, plots against it or shields those doing so, attempts to induce her to commit adultery, falsely accuses her of adultery, commits adultery in the home or persists in doing so in the same town or is impotent when married and continues so for three years. The Roman law as in force in Holland authorizes divorce for adultery, malicious desertion, imprisonment for four years, gross ill treatment, or by mutual consent after five years of judicial separation whether procured by mutual consent or trial. All divorce suits are heard *in camera*. By the act of 1910 Portuguese law permits divorce on grounds of adultery, conviction of a major crime, ill treatment, desertion for three years, absence without news for four years, incurable insanity, *de facto* separation by mutual consent for ten years, habitual gambling, incurable contagious disease, unsustained charge of adultery, criminal conviction, cruelty, desertion, gambling or infectious disease. Divorce is possible by mutual consent subject to specified conditions.

The grounds for divorce are almost the same in Austria (for Protestants), Germany and Switzerland although they differ from each other somewhat in wording. They include adultery, bigamy, unnatural crime, attempt upon life, wilful desertion and gross abuse. In addition German law specifies insanity, violation of marital duties and dishonorable or immoral conduct; the Austrian, immorality, infectious disease, sentence to penal servitude and long absence without news. In both Austria and Switzerland invincible aversion may lead first to judicial separation and then to divorce and in the latter country insanity may also be a ground for divorce. Belgium permits divorce by mutual and unwavering consent with judicial approval, also for adultery of wife or of husband if he has kept his mistress in the house, excessive violence or cruelty, grave indignities and conviction of an infamous offense. The grounds in France include adultery, personal violence, cruelty, grave indignities, conviction of a crime involving imprisonment and moral degradation, and three years' judicial separation. The above grounds also serve for separations. As elsewhere in western Europe

divorces in France have greatly increased since the war; they numbered, excluding separations, 6431 in 1891, 8841 in 1901, 15,261 in 1911, 41,279 in 1920, 30,490 in 1921. After 1921 they decreased almost yearly to 18,487 in 1927.

The Swedish law of 1915, enacted after extensive study by a joint Swedish, Danish and Norwegian commission, provided for divorce by mutual consent where deep and constant discord exists. In such cases the final decree must be preceded by one year's separation during which efforts at reconciliation must be attempted by the pastor or some person designated by the court. Other grounds in Sweden are: living apart three years, wilful desertion for two years, absence with whereabouts unknown for three years, neglect of domestic duties, bigamy, adultery, exposure of spouse to venereal infection, plotting against the life or severe physical mistreatment of spouse, sentence to hard labor for three years, drunkenness, and incurable insanity for three years. Similar laws were enacted in Norway in 1918 and Denmark in 1920. These laws were expressly designed to preserve the ethical character of marriage as a union based on mutual sympathy, love and confidence and represent a strictly modern viewpoint in making mutual consent the basic ground for marriage dissolution. The number of divorces in Sweden increased from 847 in 1915 to 1040 in 1917 and to 1310 in 1920.

In imperial Russia marriage and divorce were controlled by the ordinances of the various religious bodies. The Bolsheviks introduced civil marriage at the beginning of the revolution of October, 1917, and provided for divorce by a simple judicial process. The 1927 Family Code of Soviet Russia abolished all court procedure and authorized divorce by mutual consent or upon the request of either party without specification of grounds. The registrar must record the date of marriage, children born thereto, which family name each party will retain and the agreement as to the disposition and support of the children. In case of failure to agree either party may take the case to court. The marital right of support continues for one year after divorce. Both parents must contribute to the support of children. The rules for the Caucasus, the Ukraine and White Russia are very similar but differ in details. The numbers of divorces per 1000 population were as follows for Leningrad: 1920, 1.75; 1923, 3.50; 1926, 3.43; 1927, 9.83; and for Moscow, 1926,

2.12; 1927, 9.59. These figures for 1927 represent the first effects of the new law in urban centers and are probably unduly high.

In Great Britain previous to 1857 absolute divorce was procurable only through an act of Parliament although separations *a mensa et thoro* were granted by the ecclesiastical courts. The act of 1857 set up a Court for Divorce and Matrimonial Causes with power to grant a divorce to a husband for his wife's adultery and to a wife for her husband's incestuous adultery or for bigamy with adultery or adultery combined with cruelty or desertion for two years or upward, rape or unnatural offenses. Judicial separation is procurable on various grounds including cruelty and desertion for two years or more. A royal commission reporting in 1912 favored liberalizing the grounds and increasing the facilities for divorce. Strong opposition prevented modification of the law until 1914 when the Poor Persons' Rules designed to meet the cost of procedure for the very poor were passed, providing for the hearing of undefended divorce suits in certain courts of assize. These rules were amended in 1920 and in 1926. In 1923 the sexes were placed on an equality in divorce suits, and in 1926 newspaper reports of divorce suits were sharply limited by statute. In 1930 divorce jurisdiction was extended to additional assize towns and local registries. All English decrees are *nisi* for six months; no decree can be granted if there is evidence of connivance, collusion or condonation. A wife is entitled to alimony pending suit and thereafter unless guilty; a guilty wife with property may be required to pay costs. A man cannot marry the sister of his divorced wife during the latter's lifetime. The total number of absolute divorces and annulments in England and Wales fluctuated about 160 from 1858 to 1870, rose slowly and irregularly to about 350 from 1890 to 1895 and attained a pre-war maximum of 694 in 1909. In 1919 the number was 1654; it jumped to 3090 in 1920 and to 3522 in 1921, averaged 2671 from 1922 to 1927, rose to 3190 in 1927 and to 4018 in 1928 and declined to 3396 in 1929.

In Scotland divorces are procurable on grounds of adultery or wilful desertion for four years, and remarriage at once is permitted. The number was only 250 in 1913, 829 in 1919, 776 in 1920 and 500 in 1921; it averaged 412 from 1922 to 1926 and rose to 474 in 1927 and to 504 in 1928. In Ireland absolute divorce requires a private act of Parliament and is

expensive and extremely rare—only thirty-nine were granted in sixty-five years preceding 1922—but separations are permitted.

In Canada divorces originally required an act of Parliament except in the provinces of Prince Edward Island, New Brunswick, Nova Scotia and British Columbia, but various acts, especially those of 1918 and 1930, set up special courts for matrimonial cases in all provinces except Quebec. The grounds for divorce include adultery, impotency, consanguinity, cruelty and desertion. The number for the dominion exceeded ten for the first time in 1883 and reached a pre-war maximum of 60 in 1913. It jumped abruptly to 114 in 1918, 376 in 1919, 429 in 1920 and 548 in 1921. For the years 1922 to 1929 the numbers were 544, 505, 543, 551, 608, 748, 785 and 816—the later figures representing somewhat more than one per 100 marriages annually. Divorce is easier and more frequent in the Union of South Africa, in New Zealand and in Australia than in England. In Cape Province, South Africa, where Roman Dutch law is in force, divorce is granted on grounds of adultery, wilful desertion, unnatural crime, life imprisonment, long absence and refusal of conjugal rights. Grounds for divorce in New Zealand include, in addition to adultery and wilful desertion for five years, habitual drunkenness for four years combined with cruelty or desertion by husband or neglect of duties by wife, sentence of seven years' penal servitude, and incurable lunacy for seven years. In New South Wales and Victoria the grounds are adultery of wife or adultery of husband coupled with bigamy; incest; cruelty or desertion for three years; malicious desertion for three years; habitual drunkenness combined with non-support or neglect of domestic duties; non-compliance with decree for restitution of conjugal rights, imprisonment for three years under a commuted sentence for a capital crime or sentence of seven years' imprisonment; conviction for attempt to murder or for the infliction of grievous bodily injury; repeated assaults and cruel beatings during preceding year; and frequent criminal conviction of husband coupled with desertion or non-support. The total number of divorces in Australia averaged 29 a year from 1871 to 1880, 70 from 1881 to 1890, 358 from 1891 to 1900, 401 from 1901 to 1910, 707 from 1910 to 1920 and 1564 from 1921 to 1926.

For the United States reasonably complete data have been gathered by the federal government for the forty years 1867 to 1906, for the

year 1916 and annually beginning with 1922. The actual number of divorces (with a few counties missing at the first three dates) rose from 9937 in 1867 to 27,919 in 1887, 72,062 in 1906, 112,036 in 1916 and 195,939 in 1928, nearly every year showing an increase over its predecessor. There were about 30 percent additional divorce suits denied or discontinued. The rate of divorces per 100,000 population was 28 in 1870, 73 in 1900 and 163 in 1928. It was 81 per 100,000 married persons in 1870, 200 in 1900 and 399 in 1928. The number of marriages to one divorce was about 33 in 1870, 12.3 in 1900 and 6 in 1928. Since divorces are increasing faster than marriages, the proportion of marriages ultimately dissolved by divorce is greater than the foregoing ratios.

The most frequent legal grounds for divorce as classified by the Bureau of the Census are adultery, cruelty, desertion, drunkenness and neglect to provide. The less frequent grounds are bigamy, coercion, conviction of crime, fraudulent representation, gross neglect of duty, illegal marriage, impotence, incompatibility, insanity, misconduct, physical incapacity, separation, vagrancy and venereal disease. During the half century between 1867 and 1916 desertion was by far the most important single declared ground for divorce, accounting for 36 percent to 40 percent of all cases. By 1922 it was surpassed by cruelty, which was the chief declared ground in 12.9 percent of cases in the five years between 1867 and 1871 and in 40.6 percent in 1928. Desertion, however, has remained the primary ground for divorces granted to husbands, while cruelty has since 1916 been more frequently than desertion the ground for divorces granted to wives. Adultery, which was the ground for divorce given in 25.6 percent of all cases during the years 1867 to 1871, was only one third as important in 1928. In 1867 it was alleged in 38.6 percent of divorces granted to husbands and in 18.4 percent of those granted to wives, but in recent years it has been alleged in one divorce in seven granted to husbands and one in sixteen granted to wives. One fourth of all divorces due to adultery occur in New York, where adultery is the one ground for divorce. The most striking change in the legal grounds for divorce is the increase in cruelty, especially of wives. This term has come to cover a great variety of marital difficulties and is used to conceal causes which are viewed as disreputable or which injure the personal pride of the complainant.

The proportion of all divorces granted to wives remained steadily at about 66.6 percent from 1867 to 1916 but since then has regularly exceeded 70 percent. Since 1867 this percentage has been lowest in the south Atlantic division and highest in the Pacific, followed closely by the north central. The greater number of divorces granted women is in part accounted for by the greater number of legal grounds granted them, but it is due also to the custom which permits the wife to bring suit when both parties desire a divorce. A striking feature of American divorce statistics is that from 1887 to 1906 only 15.4 percent of all cases were contested and that latterly this percentage has decreased to less than 12. Since in many of these cases the contest consisted merely in filing an answer in order to expedite proceedings, one seems warranted in saying that divorce is the result of mutual consent in at least six out of seven cases. The longer a marriage endures the less is the probability that it will be dissolved by divorce. In comparison with the forty years from 1867 to 1906 there has been a considerable increase in the proportion of divorces in which marriage has been of short duration.

The proportion of American divorces reporting minor children has varied from 34 to 40 percent since 1887. Considered in conjunction with the fact that considerably more than one third of divorced unions endure less than five years (separations take place even earlier) this suggests that a large number of marriages are in the nature of trial or experimental unions subject to dissolution unless they lead to the founding of a family. Divorce also varies with occupation, but the only extensive data available relate to about one fourth of the divorces from 1887 to 1906. These show in terms of the husbands' occupations that persons engaged in agricultural pursuits have furnished less than their proportion of divorces, those engaged in manufacturing and mechanical pursuits and trade and transportation a due proportion and those in domestic and personal service and professional pursuits an unduly large proportion.

Legal grounds for divorce and its frequency vary greatly from state to state. South Carolina permits no divorce, New York and the District of Columbia permit absolute divorce on the sole ground of adultery, New Jersey permits it on grounds of adultery, cruelty or desertion and the other states have an average of eight grounds each. Migration for the sake of divorce from states of difficult to those of easy procedure

is so infrequent that true rates differ little from the official rates except for Nevada. The rates, moreover, seem to bear little relation to the number of grounds for divorce. Pennsylvania with eight grounds and New Jersey with three have very similar rates per 1000 population; Iowa with six grounds has a much higher rate than Nebraska, South Dakota or Minnesota with seven each; Michigan's rate is more than twice that of Wisconsin although each has eight very similar grounds. Because of legal differences divorces procured in one state are not always recognized in others; a marriage following divorce may be legal in one state but illegal or bigamous in another. The status of children is correspondingly affected. The Supreme Court has, however, sustained the right of each state to determine the marital status of those domiciled within it. Confusion likewise arises, notably in New York, from divorces secured abroad and especially in the Mexican states. The divorce rate is least frequent along the Atlantic seaboard, Florida excepted; it rises as one moves westward and reaches its apex in the Pacific states. These differences have prevailed continuously for sixty years. Similarly in Canada the rate rises sharply from Prince Edward Island and Quebec with almost no divorces to Alberta and British Columbia with rates per 100,000 population only slightly lower than those of some of the eastern United States.

The causes of differences in frequency of divorce in the various states are complex. The fact that the states with the highest rates are with the exception of Texas and Oklahoma in the Pacific and mountain divisions is explained by the fact that the population is of native stock and Protestant religion and that its original individualism in political and social tradition has been accentuated by frontier experience. Low rates and slow increase are associated in New England and the middle Atlantic states with traditional conservatism and large foreign born Catholic populations and in the south Atlantic states with conservative Protestantism, rural isolation and retardation of economic development. The influence of the Negroes in the South on the divorce rate is difficult to determine; the returns are incomplete as to race, and many Negro marriages, as among the poor everywhere, are said to be terminated without the formality of divorce. The census office could reach no conclusion as to whether divorce was more prevalent among Negroes than among whites (United States, Bureau of

the Census: *Marriage and Divorce, 1867-1906*, Washington 1908-09, pt. 1, p. 22). The differences in the legal grounds for divorce seem to be relatively unimportant factors although they seem to account for the low rate in New York and the high one in Nevada—rates largely due to interstate migration. The attitudes of the courts, the time, complexity and expense of procedure and rules for the disposition of children and property are much more important than the letter of the law. Numerous divorces are doubtless associated with facile procedures in times of social upheaval. Six years after 1792, when the French authorized divorce on many grounds, including incompatibility of temper, the number of divorces in Paris exceeded the number of marriages. Nevertheless, divorce by mutual consent has resulted in Sweden in a divorce rate lower than that of New York. The attitudes prevalent in the popular mores of sex and family are of overwhelming importance. Limiting the grounds for divorce increases resort to those that remain or increases desertion and subsequent bigamy or unlawful union without formality of divorce. For these reasons it does not seem probable that a federal law in the United States in harmony with public sentiment would measurably reduce the divorce rate. Marriage is a psychophysical relationship of such intimacy that law can only register its beginning and its end and is powerless to effect its satisfactory continuance. Law may, on the other hand, check hasty divorce and prevent injustice in marriage dissolution.

That urbanism and industrialism are factors in increase of divorce has long been accepted as a truism. Numerous studies in Europe and America have shown that divorce is largely a phenomenon of the city, that it increases in times of prosperity and declines during depressions. The progress of material culture, however, tends steadily to reduce differences between city and country. American data warrant the conclusion that divorce rates are higher in urban than in rural areas if comparisons are limited to urban and rural counties of the same state. When, however, comparisons are made by states, as between Massachusetts, Rhode Island, Connecticut, New York and Pennsylvania on the one hand and Texas, Oklahoma and Arkansas on the other, both urban and industrial factors are more than offset by differences in the nativity of the population and cultural, religious and other factors affecting the political and domestic status of women.

Encyclopaedia of the Social Sciences

The causes of the rapid rise in divorce rates throughout the world during the past century are to be found in the great social transformations attendant upon the progress of science and industrialism which have resulted in the emancipation of women. By placing economic independence within the reach of women they have with the aid of ideals of democracy and liberty hastened the decline of patriarchal institutions and enabled women successfully to assert their claim to equal political, civic and marital rights. At the same time the spread of rationalism has undermined the social control formerly exerted by religious beliefs and institutions which had been strongly imbued with doctrines of feminine inferiority. The decrease in the size of the family and the increased activities of the state as a superparent have also reduced the bonds of marital stability. There has been an increase of leisure and of opportunities for sex stimulation and experimentation, and at the same time discord and lack of authority in the sex mores have released the deep seated desire for sex variety with its attendant suspicion and jealousy. Economic and parental bonds within the family have been weakened, leaving the permanency of marital unions increasingly dependent on the attractions of sex and personality. The individualism of the age, accentuated by universal education, has so expanded the latitude of egoistic desires that the subordination of personality and accommodation of attitudes essential for marital happiness have become increasingly difficult.

Divorce, a symptom of the liberalizing tendencies of modern culture, seems likely to increase as long as underlying conditions continue their present trends. Western nations are moving rapidly toward divorce by mutual consent or at the will of either party with simple procedure, in the belief that marital happiness is possible only when marriage bonds harmonize with the bonds of affectionate esteem. It is recognized that legislation must take full account of changes in the mores unless it is to cause unhappiness and encourage irregular unions, that marriage laws can be improved to reduce haste, coercion and fraud in marriage and that education can reduce ill considered unions and prepare both husband and wife for the ordeal of mutual adjustment. Conservative thought, however, still favors either prohibition of divorce or its limitation to cases of adultery. Radical opinions vary. Some, recognizing the difficulties of marital adjustment in a complex

society, favor marriage under trial conditions with provision for easy dissolution. Amidst the conflicts of opinion it seems possible to assert that the rising divorce rate has been attended by refinement of marital relations and that increased divorce has not brought marriage into disrepute.

DIX, DOROTHEA LYNDE (1802-87), American social reformer. Her lifelong interest in social reform began in 1841, when she undertook Sunday instruction for the women in the East Cambridge House of Correction and found some insane persons confined in an unheated room. In order to learn whether the evil conditions in East Cambridge were typical she visited every jail and almshouse in Massachusetts and then prepared a memorial to the legislature (Boston 1843; reprinted in *Old South Leaflets*, vol. vi, Boston 1904, no. 148), in which

she presented the results of her investigation. This was the first of her long series of investigations in more than twenty states and her moving appeals to the various legislatures setting forth the urgent necessity for state hospitals for the insane. Between 1842 and 1845, when railroad service was still very limited, she traveled 10,000 miles, visited 18 state prisons, 300 local jails and houses of correction and more than 500 almshouses and other institutions. Her *Remarks on Prisons and Prison Discipline in the United States* (Boston 1845) is an exposition of the conditions she found.

In 1848, at a time when numerous private and local influences were asking for congressional grants of federal public lands, she presented a memorial to Congress asking for a grant of 5,000,000 acres of which the sale proceeds were to be used for the relief and support of the indigent insane. Later she raised her request to 12,225,000 acres and added provision for the blind and the deaf and dumb. She finally secured the passage of her bill in 1854, but to the intense disappointment of the friends of social welfare it was vetoed by President Pierce. Meanwhile, in 1852 Congress passed without subsequent veto her District Hospital Bill for the relief of the insane of the army and navy and those of the District of Columbia. From 1854 to 1856 she was abroad and was instrumental in the creation of a royal commission to investigate conditions in Scotland and in the building of a hospital in Rome. In April, 1861, she reported "for free service" in the War Department and became the superintendent of women nurses during the Civil War. The remainder of her long life was spent in supervising the results of her work. In spite of tremendous difficulties, not the least of which were the prevailing ideas as to the propriety of women in public life, Dorothea Dix accomplished her purpose and launched the movement of humanitarian reform in state institutions.

DŁUGOSZ, JAN (Longinus) (1415-80), Polish historian. Długosz was born in Brzeznica. He entered the church, studied at the University of Cracow and was engaged in many diplomatic missions in the service of Cardinal Oleśnicki. His historical work stands with that of Com-

mines and of Machiavelli as one of the great landmarks of modern historiography. Długosz' many writings on the history and institutions of Poland represent the first important attempt at a scientific study of Polish geography, ethnography and history, for which he utilized the various Polish and non-Polish chronicles of the preceding age, collected documents from Polish, Lithuanian and German state and ecclesiastical archives and drew on his own personal recollections for the later periods. Although he aims to be critical and objective he is a strong partisan of the claims of the church and of the privileges of the nobility. His chief purpose was to effect a national education of the Polish people to great political ends. He was an admirer of the politics of Oleśnicki and wished to make Poland the most important power in eastern Europe and the Cracovian region of Poland with her aristocracy the prime influence in the kingdom.

DMITRIEV, VLADIMIR KARPOVICH (1868-1913), Russian economist. Upon the completion of his studies in the law faculty of Moscow University Dmitriev was appointed to a provincial office in the Bureau of Excises. In 1896 he fell ill and resigned his position; the rest of his life was spent in a bitter struggle against tuberculosis and poverty.

Dmitriev's *Ekonomicheskije ocherki* (Moscow 1904) is a collection of essays on economic theory. The first of them is an algebraic version of the Ricardian theory of value which helps among other things to clarify the frequently misinterpreted proposition that wages and profits are related inversely; here Dmitriev follows Ricardo in assuming that the total expenses of production can in the last resort be reduced to wage payments. Another essay treats in the spirit of Cournot of the relation between monopolistic and competitive prices. A novel feature of the discussion is the attempt to con-

sider among competitive costs "realization costs" and the cost of unsalable inventories in addition to the ordinary expenses of production. The last essay, a study of the marginal utility theory, is replete with acute and original observation. Dmitriev traces the doctrinal development of marginalism beginning with Galiani and attempts to prove that marginal utility allows of an "organic synthesis" with labor value but rejects Tugan-Baranovsky's method of reconciling the two theories.

The only other book by Dmitriev, *Kriticheskiya izsledovaniya o potreblenii alkogolia v Rossii* (Critical studies of alcohol consumption in Russia, Moscow 1911), combines an expert knowledge of the subject and careful manipulation of statistical data. It attracted immediate attention and was made the basis of a collective study by A. A. Chuprov's statistical seminar at the St. Petersburg Polytechnic.

L. VON BORTKIEWICZ

Consult: Bortkiewicz, L. von, "Wertrechnung und Preisrechnung im marx'schen System" in *Archiv für Sozialwissenschaft und Sozialpolitik*, vol. xxiii (1906) 1-50, vol. xxv (1907) 10-51, 445-88; Seraphim, Hans-Jürgen, *Neuere russische Wert- und Kapitalzinstheorien*, Sozialwissenschaftliche Forschungen, Abt. i, no. 4 (Berlin 1925).

DOBROGEANU-GHEREA, CONSTANTIN (Solomon Katz) (1855-1920), Rumanian sociologist and socialist leader. Dobrogeanu-Gherea was born in Russia but in 1875 came as a Russian refugee to Rumania, where he lived most of his life. The influence of his sociopolitical and literary works makes him a significant figure in Rumanian intellectual history. He edited *Contemporanul* and *Literatura și știința*, two Rumanian reviews, and contributed to the *Revue internationale de sociologie*.

He was the founder and outstanding theorist of the Rumanian socialist movement. He established socialist clubs in Jassy, Bucharest and Ploiești which were the bases of the Socialist party organized under his direction in 1892. He was a strict Marxian and was instrumental in turning the early anarchistic revolutionary elements toward orthodox socialism. Throughout his life he continued to take an active interest in the socialist movement, mainly through his writings. A number of his works deal with the application of socialism to industrially undeveloped countries and are an important contribution to socialist theory. In the last years of his life he energetically opposed the anti-Bolshevik movement among socialists.

Dobrogeanu-Gherea's best known sociological work was *Neoiobagă* (Bucharest 1910, reprinted 1921), a penetrating analysis of the Rumanian agrarian problem. In it he condemned the inadequate reform of 1864 which abolished serfdom but introduced what he termed "neoserfdom." He also maintained that the cooperative movement would neither ameliorate nor solve the agrarian problem. The book aroused great interest and exerted considerable influence upon Rumanian agrarian theory.

Dobrogeanu-Gherea also achieved distinction as the chief Rumanian literary critic of his period, the leading opponent of the romanticism of contemporary Rumanian literature.

N. GHIULEA

DOBROLUBOV, NIKOLAY ALEXANDROVICH (1836-61), Russian critic. The son of a Nizhni Novgorod priest, Dobrolubov was educated at a local theological seminary and at the Institute for Teachers (Glavny Pedagogichesky Institut) in St. Petersburg. In 1856 while still an undergraduate he published his first article in one of the outstanding periodicals of the time, Chernyshevsky's *Sovremennik* (the Contemporary), and on his graduation in 1857 he took charge of its literary department.

True to the spirit of the time in which Russia was then living—the transition from serfdom to new forms of life—Dobrolubov imbued his literary work with moral and social ideas. He combined a profound idealism with a rigidly realistic attitude toward the problems of life. He vigorously denounced the servility, arbitrariness and ignorance of the Russian people and untiringly called for the building of a new life on the basis of freedom and tolerance. A democrat and radical with decided leanings toward socialism, he viewed with suspicion the upper classes, ridiculed their idleness and impotence and was skeptical of liberalism, especially of his Russian liberal contemporaries and their admiration for the reforms then initiated, which he deemed insufficient. But he had deep confidence in the working classes, especially in the peasants, and he urged the educated groups to work for their welfare. Although he never formed a complete theory Dobrolubov arrived at a clear conception of the essence of art, which he undertood to be the faithful reflection of the realities of life. By applying this standard in his literary criticism he ruined many literary reputations. Dobrolubov gave much attention to problems of education, the object of which he considered to be the free

and full development of human personality. He strongly opposed the use of coercion in any form. Dobrolubov's work had great influence. Russian literary criticism long followed the path he had traced and he left a strong mark on the revolutionary movement of the period.

V. MIAKOTIN

Works: *Sochineniya* (Collected works), 4 vols. (7th ed. St. Petersburg 1901).

Consult: Skabichevsky, A. M., *N. A. Dobrolubov* (St. Petersburg 1894); Masaryk, T. G., *Russland und Europa*, 2 vols. (Jena 1913), tr. by E. and C. Paul as *The Spirit of Russia* (London 1919).

DOBROVSKÝ, JOSEF (1753–1829), Czech philologist. Dobrovský was born in Hungary of Czech parents and was educated in German schools in Bohemia. He studied philosophy and theology in Prague and in 1772 joined the Jesuit order. After the order was dissolved in 1773, he devoted himself exclusively to a life of scholarship and research.

Dobrovský's work, while almost exclusively philological, represents the first important stage in the development of the Czech national movement. He was the initiator of the cultural renaissance that laid the basis for the subsequent political movement. Under the influence of the historical ideas of Herder and Schläzer and the philological works of Fulda and Adelung he became the first philologist and historian of Czech and other Slavonic languages. Although he himself wrote most of his books in German and Latin, his work was nevertheless influential in reviving the use of the Czech language and in fixing its standards. In 1791 there appeared his epoch making book, the *Geschichte der böhmischen Sprache und älteren Literatur* (Prague 1792, new ed. 1818), which was the first attempt to present a true, scientific picture of the history of the Czech language, literature and culture from earliest times. Its influence on the awakening was tremendous and was the starting point for the later work of Hanka, Čelakovský, Kollář, Palacký and Šafařík.

Dobrovský's influence extended also to the other Slavonic nationalities and he is one of the first exponents of pan-Slavism. His journeys to Sweden and Russia from 1792 to 1799 were the beginning of the contact between Czechs and Russians. Through correspondence, personal contact and above all through his journals, *Litterarisches Magazin* (1786), *Slavin* (1806) and *Slovanka* (1814–15), he established a cultural cooperation between the various Slavic national-

ities which had as its basis not only a common linguistic interest but a strong belief in the unity of Slavic cultural traditions and national psychology and even a vague hope for a political union of all the Slav peoples.

DOCKS. See PORTS AND HARBORS; LONG-SHOREMEN.

DOCTRINAIRE. The epithet doctrinaire has a specific historical as well as an ill defined general meaning. Written with a capital it refers to a parliamentary group in Restoration France which under the leadership of Guizot and Royer-Collard aimed at a constitutional monarchy with a strong, governing king, a conscientious nobility and a liberty loving but not rebellious people. Their political philosophy, although designed primarily to justify their immediate program and the particular system of government which they championed, was based on rather abstract concepts and appealed to generalized laws of history and reason. Their doctrines were rather rigidly held and pompously defended in parliament, but the epithet doctrinaire was the lucky stroke of a hostile journalist. Originally a neutral word applied to a teaching order of monks, doctrinaire was filled by the enemies of Guizot with its familiar connotation of pedantry and impracticality. It came soon to apply to a certain temperament in politics and as such was taken bodily into English.

In this general sense a doctrinaire is one who holds fast to a theory or theories which to competent critics may seem inconsistent with facts. He adapts his theory, regardless of the limited field in which it may have originated, to everything he touches; and as he usually wishes to mold the conduct of his fellows to his theory he appears in politics as a reformer. The word thus carries with it some of the connotations of dogmatist, fanatic and crank, with which popular usage often confounds it. But it is a useful term and deserves to be isolated as far as possible from words of abuse. The ideas of the doctrinaire are, superficially at least, arrived at by systematic thinking; they are concerned with the social sciences and the arts rather than with theology; and they are not wildly unreal. Belief

in the Virgin Birth, for instance, or in the flatness of the earth is not doctrinaire belief; belief in the single tax commonly is.

Such radical reform groups as the single taxers, Marxian socialists, anticlericals and free traders at all costs are rich in doctrinaires. But the temperament is by no means confined to such groups. Modern monarchists like the Action Française group, for instance, are clearly doctrinaires. The psychological origins of the temperament are revealed most clearly by a consideration of its opposite. The true opposite of the doctrinaire is not, as might at first appear, the opportunist but the scientist. The opportunist follows a planless, rule of thumb procedure and bears no relation whatsoever to the doctrinaire; but the scientist, like the doctrinaire, guides himself in relation to men and things by theories. The true scientist, however, regards his best theories as hypotheses and is always willing to attempt to change his theories to fit inconvenient facts; he is fully aware that certain of his judgments—his moral preferences, his aesthetic tastes—cannot be completely equated to his scientific theories; and he is constantly on the alert to analyze his own mental processes and to keep his emotions from coloring his theories. The doctrinaire, on the other hand, holds his theories as articles of faith; he cannot admit the possibility of changing them; and he habitually confuses his affects and his thoughts. His is the theological temperament applied to politics. That he uses part of the methods and much of the phraseology of science cannot conceal his true nature. One of the most doctrinaire assertions of *laissez faire* is to be found in *Social Statics* and in *The Man versus the State*, the work of a man who prided himself on having achieved a synthesis of contemporary scientific thought.

The deficiencies of the doctrinaire temperament are apparent. In authority the doctrinaire can maintain himself only in exceptional circumstances and for the briefest time, as did Robespierre. His world is sometimes too good and always too simple to be realized. He may make disciples, but time and change will alienate them. He certainly will make many and bitter enemies, perhaps acerbate political quarrels. For, as Hazlitt observed, men hate abstract principles more than persons; and the doctrinaire sets up the contentious idea and neglects the compromises of the flesh. Nor is the doctrinaire often a great initiator; he is more likely to be the follower who exaggerates a master's

teachings. Not Voltaire nor Rousseau but Robespierre, not Adam Smith but Nassau Senior, is the doctrinaire. On the other hand, the doctrinaire has social value as a fighter. He has put energy into many a cause that without him had insufficient roots in human desires. He is no materialist and never less so than when as an orthodox Marxian he is defending that highly intellectualized and unworldly doctrine, the economic interpretation of history.

Yet the interest of the word doctrinaire lies less perhaps in its use than in its abuse. Ever since its original application to Guizot and his followers it has carried with it a reproach that has put an unnecessary and often tragic fear into those so designated. Men who from interest or principle or inertia have disliked any political change have not hesitated to apply it quite unjustly to all who sought specific reforms. Even before Guizot so great a man as Burke abusively applied the title metaphysician with just this derogatory meaning to the makers of the French Revolution. In our own time Woodrow Wilson fell victim to his fear of the reproach contained in the word doctrinaire. The origins of this fear are interesting. In the nineteenth century the failure of the French Revolution, which seemed, especially in the pages of Taine, to have originated in eighteenth century speculation, together with the great success of England, which seemed, especially in the pages of English publicists, to have sprung from a hearty contempt for mere thought, combined to discredit clear cut and carefully constructed plans of reform. The anti-intellectual emphasis of modern social psychology, in such writers as Le Bon and Tarde, for instance, has doubtless added to this discredit. Thought appeared to be in politics a useless and therefore a dangerous guide. Yet there are signs of change. Mr. Graham Wallas, who cannot be accused of undervaluing the part played by unreason in politics, has written: "Thought may be late in evolution, it may be deplorably weak in driving power, but without its guidance no man or organization can find a safe port amid the vast impersonal complexities of the universe as we have learned to see it." To employ thought—and therefore theories—on the stuff of politics is not the mark of a doctrinaire; that word ought not today to frighten any honest thinker—or doer.

DODGE, DAVID LOW (1774-1852), American pacifist and philanthropist. Dodge, a New York merchant, was the author of *The Mediator's Kingdom Not of This World: but Spiritual* (New York 1809) and *War Inconsistent with the Religion of Jesus Christ* (New York 1812; republished Boston 1905, containing a reprint of *The Mediator's Kingdom* and an introduction by E. D. Mead). He founded the first peace society in the world in New York in 1815. On the basis of Christian and humanitarian arguments and a deep faith in the efficacy of returning good for evil he argued with consistent logic that war was inhuman, unwise and criminal. Although his standard was too thoroughgoing for the American peace movement as a whole, since it altogether repudiated the doctrine that the end justifies the means, his influence stimulated and

helped clarify early antimilitarist arguments. He was the first influential non-Quaker pacifist writer in America. Dodge was also a pioneer in opposing capital punishment. Believing that governments were based on force, he refused to compromise his allegiance to Christ's laws by obeying the state when conflict arose.

MERLE E. CURTI

Consult: Memorial of Mr. David L. Dodge, ed. by M. M. Smith (Boston 1854); Curti, M. E., *The American Peace Crusade, 1815-1860* (Durham, N. C. 1929) p. 6-9, 11-12.

DOGMA. In ancient philosophy dogma meant axiom or maxim, that which claims ultimate, not merely relative, truth. In theology the term designates doctrines authoritatively defined and enforced by a church or sect. Sometimes it is incorrectly used as synonymous with theology. The distinguishing characteristic of dogma is its support by explicit or implicit social authority: explicit authority appears in the case of tenets embodied in official creeds, requiring assent; implicit authority is present in the case of dogmas, religious or otherwise, which are regarded as self-evident but actually rest on social acceptance.

The origin of dogma may be sought in what Durkheim has called "collective representations"—those primitive, psychical attitudes in which representational, emotional and motor elements are blended and which are common to the members of a group, transmitted from generation to generation and impressed upon the individuals, awakening in them sentiments of awe and adoration. Participation in the group life is one, but not the only or primary, root of these representations; religious experience in particular involves other factors besides the experience of social unity. Collective representations are embedded in ritual, of which they are the presupposition but which also tends to define and elaborate them. With the growth of social differentiation and criticism myth arises as the explanation and defense of ritual and of the collective representations embedded in it. In dogma the essential content of myth is abstracted, defined and promulgated by social authority. Hence ritual and myth are antecedent to dogma, although germs of the latter are contained in their earliest forms. Explicit dogma arises as the counterpart of heresy, against which it is directed in order to exclude disintegrative forces, to preserve tradition and its knowledge values and to establish social unity.

The basis of Christian dogma was the primitive Christian community, centering in common loyalty to Jesus and His teaching, the expectation of His return and the ecstatic experiences of the "Spirit." The community shared with the groups surrounding it Jewish monotheism, cult and religious tradition. Authority attached to those who had had immediate experience of Jesus and who could report His teaching and eventually to their immediate successors and to the written reports of the teaching of Jesus and the apostles. The Old Testament was received as divine revelation, but no abstract and definite formulation of the content of this tradition was made or enforced. The next stage in the development of dogma arose out of the need for instruction of new Christians and their introduction into the churches. The baptismal formula represents the first somewhat vague formulation of the faith. Further definition and authoritative promulgation proceeded through the processes of conflict and accommodation and through the influence of church organization. Conflict developed first with Judaism and with Judaistic Christians who sought to maintain primary contact with the old faith. The result was the exclusion of Jewish elements from the cult and emphasis on the distinctively new doctrine, the Messiahship of Jesus. The conflict was partly occasioned by and partly resulted in Christianity's approach to kindred Hellenistic groups (Hellenized Jews, Gnostics), with whom it entered into a new process of accommodation and conflict. The resultant amalgamation of Christian religious convictions with Greek metaphysics was gradually set forth in expanded baptismal symbols and in theologies. But the final and authoritative promulgation of doctrine waited upon the organization of the church and its association with the state. Through the development of the episcopacy, the organization of synods, the increased authority of metropolitan bishops, the institutionalization of the church and its imitation of the governmental system of the empire, finally through Constantine's assumption of overlordship over the church, the conditions were created for an authoritative definition and proclamation of doctrine. This had the dual purpose of excluding elements disturbing to the unity of the church and the empire and of establishing a religious bond to guarantee the integrity of the state. The process came to its conclusion through the formulation of orthodox doctrine on the Trinity and the nature of Christ at im-

perially sanctioned church councils, especially those at Nicaea in 325 and Chalcedon in 451.

While the eastern Orthodox church maintained the dogma as formulated in the first five centuries, the western church continued a doctrinal development which was influenced by the Latin character of the population, Roman legal conceptions and the pedagogical and governmental needs of the Germanic races as well as by the religious experiences and theologies of its leaders. The conflict with Protestantism led to the formulation at the Council of Trent of the Catholic dogma thus prepared. In general, however, Roman Catholicism subordinates the authority of dogma to that of the church, its fundamental dogma being the infallibility of the latter in its teaching function—a doctrine which was finally formulated in the dogma of papal infallibility. Dogma in the Catholic definition consists of revealed truths in so far as these are defined and proposed by the church; the limits of revelation, however, are not clearly defined since tradition as well as Scripture is regarded as its vehicle and the ecclesiastical formulation of dogma need never be closed.

The basic Protestant dogma is the definition of the Scriptures as divine revelation, the infallible guide of faith and practise. In so far as the interpretation of Scripture is not prescribed it may be maintained that Protestantism is essentially undogmatic. But in addition to the fundamental dogma many Protestant churches accepted the dogmas of the early church as authoritative, promulgated them in official creeds and interpreted the doctrine of justification by faith with correlated doctrines as the essential teaching of Scripture. The result has been a Protestant dogmatism which, in distinction from the Catholic, is closed and allows no further development. Dogmatic Protestantism has upon the whole been represented by the state churches and their offshoots, while the sects have in theory adopted the freer attitude, contenting themselves with the dogma of Scriptures. Yet dogma in the form of tradition and of accepted but not creedally promulgated doctrine has also flourished among the latter.

While dogma actually reflects the particular historical conditions under which it originated it claims immutability, universality and eternal validity. This claim rests partly on the immediacy and sufficiency of those religious experiences which, it is believed, dogma defines, but its sources will also be found in the desire for religious certainty, in the historical relation-

ship of dogma to political absolutism and in the need of every philosophy for some axiomatic basis. Nevertheless, dogma as the report of religious experience or as the theological definition of religious axioms admits the relativity of all formulations and is quite distinct from dogma as the officially promulgated but historically conditioned doctrine of ecclesiastical institutions. Yet dogma in the latter form derives its psychological and popular support from being confused with dogma as faith.

Dogma has an important educational function, since it serves to define and transmit the content of religion; it has a governmental function within the church, since it seeks to preserve the unity of the group by excluding heresy and fostering uniformity; and it has a political function in the secular sphere, since it has often been used as an agency of political unification and control. With the growth of religious freedom and the disestablishment of the churches it has been practically restricted to the educational function. Its efficacy in this respect appears in the continuation of attitudes of obedience and acceptance among members of those churches which continue the dogmatic tradition and in the particular characteristics of their piety.

The conflict of dogma and science has been due in part to the clash of an individualistic, freely inquiring attitude with authoritarianism and the attitude of obedience, so that the conflict is part of the whole modern and democratic movement. The reappearance of dogma in connection with political dictatorship and the Marxian theory is interesting in this respect. The conflict of dogma and science, however, is also the result of the inertia of tradition, since religious tradition sanctions traditional belief and custom in general; overt conflict with science has been occasioned far more frequently, for instance, by merely traditional, unofficial dogma (such as the literal interpretation of the Scriptures) than by the creedally formulated doctrines. Further, some conflict has been due to the unavoidable clash between the axioms of religious belief and dogmatic philosophies, such as materialism, claiming scientific character.

Dogma as authoritatively promulgated doctrine is peculiar to authoritarian institutions, but as an axiom it also appears in science, where it is indispensable. Furthermore, scientific hypotheses which in popular or academic philosophy are exalted into metaphysical principles and accepted uncritically have the efficacy of dogmas in the social life. In this sense one

may speak of the dogma of evolution, the dogma of the economic interpretation of history or the dogma of the location of the mind in the brain.

DOHERTY, JOHN (1797-1854), British trade union leader. Doherty was an Irishman who migrated to Manchester about 1814 and found employment as an operative cotton spinner. In 1825 he allied himself with Francis Place in the movement against the threatened reenactment of the combination laws. Later he became prominent as secretary of the Friendly Associated Cotton Spinners, a post which also involved duties in connection with the Time Bill Committee and the Society for the Protection of Children Employed in Cotton Factories. In 1829 he led the association through a six months' strike. His letters to employers and weekly addresses to strikers and sympathizers during this period show marked ability. Before the strike reached its unsuccessful conclusion he began to advocate the formation of a Grand General Union of Cotton Spinners throughout the United Kingdom and of a General Trades Union for Manchester, whose main object, that of resisting reductions of wages, was accepted in 1830 as the chief aim of the National Association for the Protection of Labour which, he asserted, came to comprehend cotton spinners and workers in many other trades in several counties in England. Press support for the association was found in the *Voice of the People* (first issue January, 1831) which he edited, but both the

association and the periodical had short lives. By 1832 he had commenced business as a bookseller and printer and became responsible for the *Poor Man's Advocate*, which quickly involved him in more than one prosecution for libel and consequent imprisonment. In 1833 his resistance to the payment of church rates led to the seizure of a portion of his furniture, and in this and the following year he took a prominent part in Manchester meetings concerned with the troubles in Ireland. In connection with his shop he conducted the Manchester Coffee News Room, where for an admission charge of one penny "ninety-six newspapers and periodicals may be seen every week." In 1838 he appeared before the Select Committee on Combinations of Workmen and gave an account of the spinners' organizations and strikes when he was secretary, an account which is verified in detail in contemporary records. Throughout his active career he continued a strenuous advocate of factory reform.

DOHM, HEDWIG (1833-1919), German feminist and novelist. Hedwig Dohm was the first woman in Germany to raise her voice for the right of women to vote. She stepped into the arena of the women's movement at a time when clergymen and physicians were opposing it with theoretical arguments as to woman's capabilities and her role in life. By her adroit and witty exposure of the absurdities of some of their statements in her pamphlets, *Was die Pastoren von den Frauen denken* (Berlin 1872), *Die wissenschaftliche Emancipation der Frau* (Berlin 1874), *Der Frauen Natur und Recht* (Berlin 1876), and in her novels she reinforced the organized movement, in which she herself took no active part. She began with the admission of a psychic difference between the sexes, much of which she considered due to faulty education and therefore not fundamental or implying a necessary division of labor and the closing of intellectual callings to women. She based her demands upon natural right rather than upon social justice or social welfare: "Women should study because they *will* to study, because the unrestricted choice of a calling is one of the main elements in individual liberty, which is the basis of individual happiness." The franchise seemed to her the key to all the other rights and liberties.

In spite of the vogue of English thought, especially the writings of John Stuart Mill, in liberal German circles Hedwig Dohm's ideas were not drawn from his *The Subjection of Women* (1869), which she stated she had not read until after the publication of her pamphlets. Her significance lies not in any profound intellectual development of feminism but in the influence radiating from her wit and her courageous independence.

DOLLFUS, JEAN (1800-87), Alsatian philanthropist. At the age of twenty Dollfus became one of the heads of a Mulhouse cotton factory which belonged to members of his family and in which he was to be actively interested for many years. As a progressive industrialist he believed that the Alsatian cotton factories must be adapted to the export trade. With this end in view he constantly introduced into his factory new machinery and other timely improvements. He was one of the first to campaign for a reduction of import duties, a policy which subsequently triumphed in the Anglo-French commercial treaty of 1860. He remained loyal to France after 1870 and was elected to the Reichstag four times as a protest member. He was active in the movement for international arbitration and general disarmament.

Dollfus is known for his welfare work, particularly in connection with workers' housing. In 1853 he founded the Société Mulhousienne des Cités Ouvrières for the purpose of building houses for workers. It began with a capital of 300,000 francs, which was later raised to 355,000 francs. The French government added a subsidy of 300,000 francs, the society built sanitary houses with gardens, which were sold to the workers at prices ranging (in 1865) from 2650 to 3400 francs. The purchaser made a small initial payment and thereafter a monthly payment of from 18 to 30 francs, which was only a little more than he would have paid as a tenant; he became sole owner of the house in from fourteen to sixteen years. By 1886 the society, which received only a 4 percent return on its investments, had built and sold 1072 houses. At Dollfus' suggestion a popular library and various cooperative stores were founded in connection with the workers' cities. On his own initia-

tive he established public baths and washhouses and improved the conditions of the laborers in his factory.

DÖLLINGER, IGNAZ VON (1799-1890), German Catholic historian and theologian. From 1826 until 1871 Döllinger lived at Munich as professor and priest. Surrounded by the eminent Catholic leaders, like Görres and Möhler, who composed the Munich center of the Catholic movement, he undertook the vindication of his faith on historical rather than merely speculative grounds. The conviction that Catholicism was less a body of doctrine than a force comprehensible only in the light of its continuous development led him to write his well documented survey of the early church, *Kirchengeschichte*, and then to invade in the first of his momentous works, *Die Reformation*, that vital field of church history which had hitherto been largely preempted by Protestants. Although he consistently attributed evil social and spiritual consequences to the Reformation he discovered that the only essential difference between its authors and Catholicism centered about the doctrine of justification. His further discovery that contemporary spokesmen of the Protestant churches were far from united in upholding this doctrine and his trust in the healing properties of common origin and traditions laid the foundations for his growing faith in the possible reintegration of all Christians into the Catholic church. Such an event seemed to him of paramount importance, since he regarded Christianity as the basis of all true civilization, the consecrator of state power, of marriage, of education, of labor and of the individual personality. While the mission of Christianity could be accomplished only by the one church, the Catholic, which was internationally united, Döllinger believed that Rome should moderate her claims in the interests of reconciliation to allow greater freedom to the national episcopal churches. This liberal Catholicism, which shows the influence of Görres and which except for its moderation resembles the doctrines developed in France by the founders of the *Avenir*, Döllinger carried into the Frankfort assembly of 1848, where he both fought for the freedom of the church from

political interference and deprecated any exemption of church members from civil obligations. At the Catholic assembly in Linz in 1850 he even proposed the establishment of a German national church.

Thus far and throughout the next decade Döllinger was at least ostensibly an ultramontane. But during the sixties his utilization of new historical documents, coinciding with the pontifical responses to the threat of Italian unification, led to a rupture with Rome. His famous lectures at the Odéon in Munich, augmented and published the same year under the title *Kirche und Kirchen*, were intended as an assurance to the Catholic world that the temporary loss of the papal states would not be fatal to the spiritual power. But Döllinger's admission that the church deserved and needed this calamity as a lustration for its gross misgovernment and a perceptible sympathy in his treatment of the Reformation indicated the trend of his thought. His exposure of spurious claims in *Die Papstfabeln des Mittelalters* dispelled all doubt. Then came his criticism of the Syllabus of 1864 and, after the summoning of the Vatican council, the overwhelming attack upon the papal institution itself contained in his *Der Papst und das Konzil* and the progressively fervid castigation of the council's activity in *Römische Briefe*, based on information sent to Döllinger from Rome by Lord Acton and others. When in 1870 the council proclaimed papal infallibility and the universality of the episcopate, Döllinger saw his life work destroyed. His denunciation of the council as untrue to the tradition of the church and as inimical to the rights of the state was followed in 1871 by his excommunication and gave rise to Old Catholicism. With this movement Döllinger never identified himself, but he lent it his advice until his death, reasserting the principle of ecclesiastical independence which Old Catholicism rejected as it joined forces with Bismarck in the *Kulturkampf*. Döllinger was one of the greatest historians of the Roman church. His passion for scientific candor and method in historiography communicated itself to a large group of disciples in Germany—Reusch, Friedrich and Cornelius—and chiefly through his pupil, Lord Acton, its influence was keenly felt among Anglican Catholics.

DOMAT, JEAN (1625-96), French philosopher and jurist. For many years Domat was a lawyer at the presidial court in Clermont. He was an intimate friend of Pascal, and although he was scarcely a Jansenist he at least shared the Jansenist hostility toward the Jesuits. His great work, *Les lois civiles dans leur ordre naturel* (3 vols. Paris 1689-94, new ed. 2 vols. 1735; tr. by W. Strahan, 2 vols. 2nd ed. London 1737), was issued anonymously and little note was at first taken of it, but the enthusiasm of Boileau and of Daguesseau gave it a vogue that spread beyond France. It was frequently cited in England but in Germany it exercised no appreciable influence. In this work Domat performed the bold and extraordinary feat of recasting the entire mass of the existing Roman law and restating it concisely in what he believed to be a rational system—a system profoundly influenced by the logical propensities of his Port-Royal friends and perhaps still more affected by their conception of life as a set of immediate relations between God and man. Without any special charm of style his work had a clearness and brevity that recommended it to the French lawyers of the eighteenth century, already predisposed in favor

of an anti-Jesuit. His method is to derive the doctrines of the French Roman law from some general principle of ethics or natural theology and to show the application of the doctrine so interpreted in other rules of law. No one before him had ventured to depart from the order of subjects found in the *Corpus juris* of Justinian or had so freely rejected obsolete doctrines or irrelevant and conflicting rules. It was the first step in that movement to cut through traditional categories which culminated in the French Revolution and the civil code.

Domat was in a sense the founder of the science of public law in France, since his little treatise *Le droit public* (2 vols., Paris 1697), published after his death, was the first French work on this subject. His manual for students, entitled *Legum delectus*, was printed in 1700 (Paris). His collected works were edited by N. E. Carré under the title of *Oeuvres de J. Domat* (9 vols., Paris 1821-25).

DOMESTIC RELATIONS COURTS. Because of their great variety in jurisdiction, organization, origin and inspiration it is practically impossible to give a general definition of domestic relations courts. Indeed, difference of opinion exists as to the very name which would best express the idea behind such courts. Domestic relations court was favored in the early days of the movement. Family court now seems preferable to social workers, while the name which is often used in the statutes themselves is juvenile and domestic relations court.

In its most general sense the idea of the domestic relations courts is bound up with the progress of the juvenile court movement and represents an extension of the idea underlying it. The juvenile courts, the first of which was established in 1899 and which are now practically universal in the United States, were devised to deal with juvenile delinquents by a special procedure of which the chief feature was the absence of the ordinary criminal forms; the child was regarded rather as a ward of the court and as a subject of clinical and proba-

tionary treatment. But as the juvenile court movement spread it was not long before it came to be urged that it was unscientific to attempt to solve the problem of juvenile delinquency without extending the jurisdiction of the juvenile court to deal also with the abnormal domestic relations which had contributed to it. A delinquent or dependent child was an indication of a disrupted or discordant home, and only a court having power also to eliminate the causes leading to delinquency or dependency could adequately cope with the situation. The family had to be dealt with as a unit according to a technique of social adjustment, and this could never be done when the various phases of domestic relations were entrusted to a whole series of independent courts. Desertion, abandonment, non-support, contributing to delinquency or dependency and offenses against children were usually cognizable in many criminal courts, while such matters as the establishment of paternity and the support of children born out of wedlock, adoption and guardianship, annulment of marriage, divorce and separation were vested in a great variety of civil courts—probate courts, chancery courts, district courts, circuit courts and superior courts—which often, moreover, had concurrent and overlapping jurisdiction. What was needed was a unified and independent court to deal with all these aspects of domestic relations. But still more important than the consolidation of jurisdiction there was to be effected a relaxation of the ordinary criminal and civil procedure in family cases, and particularly there were to be inaugurated in connection with the domestic relations or family courts family clinics and probationary and investigatory services to inquire into and control the causes of family discord and thus make it possible for a court, once it had taken jurisdiction of a case, to exercise continuing oversight. In short, the family court was to appear logically as the evolutionary product of the juvenile court movement.

The early domestic relations courts, however, had little connection with this program. They were based upon legislative motives that were actuated rather by a desire to provide more efficient forums for the administration of the laws against family desertion and non-support, which were generally being strengthened after 1900, and were thus attempts primarily to solve the problem of poverty and civil litigation—a fact that has been insufficiently recognized in

tracing the history of the domestic relations courts. The first domestic relations courts of this type were established in the state of New York in 1910, when the City Court of Buffalo created a domestic relations division. In the same year New York City was authorized by the state legislature to establish domestic relations courts as part of the system of magistrate's courts, and such courts are now to be found in the boroughs of Manhattan, Brooklyn and the Bronx. They have no juvenile jurisdiction and are distinct from the New York children's courts, dealing primarily with desertion, non-support and contributory delinquency cases. Separate domestic relations courts or divisions without juvenile jurisdiction now exist also in such large cities as Philadelphia, Boston, Chicago, Kansas City and Newark and thus may be said to represent an arrangement that is popular particularly in the megalopolitan centers.

Types of courts which come closer to the objectives of the family court movement, combining in various degrees both juvenile and domestic relations functions, have also been developing. The Cincinnati Court of Domestic Relations may be regarded as the progenitor of these. In the Court of Common Pleas there was created in 1913 a division of domestic relations, which was given not only juvenile, desertion, non-support and contributory delinquency jurisdiction but also exclusive jurisdiction in divorce and the establishment of paternity; it was not, however, vested with control of guardianship and adoption, and the court has no adequate investigatory or supervisory system. In 1913 also the Michigan legislature attempted to create a domestic relations division in the Circuit Court sitting in Detroit and to give it a comprehensive jurisdiction including divorce, but the project was declared unconstitutional [*Attorney General v. Lacy*, 180 Mich. Rep. 329 (1914)]. The St. Louis Domestic Relations Court, created in 1921 as part of the Circuit Court, had been given not only juvenile but divorce jurisdiction, yet strangely enough has been left without desertion or non-support jurisdiction. The Huntington Court in West Virginia has in addition to juvenile, desertion and non-support jurisdiction also concurrent jurisdiction with the Circuit Court in divorce cases. In 1925 courts of comprehensive jurisdiction including divorce were authorized in Oklahoma for Oklahoma and Tulsa counties, but they have not yet been established; the district judges in Tulsa refused to assume juris-

diction on the ground that the law was unconstitutional. In 1929 a combined juvenile and domestic relations court was established in Hamilton county in Tennessee with exclusive divorce jurisdiction in cases which involved the custody of children, and the independent family court of Multnomah county in Tennessee was made part of the Circuit Court and its jurisdiction enlarged to include uncontested divorce cases or those involving children under eighteen.

It would be impossible to describe in any accurate detail the domestic relations courts of all the states or even classify them very exactly. As in the case of the juvenile courts they may exist as independent courts or simply as divisions or parts of courts of more general jurisdiction. Their organization may not be uniform even within the bounds of a single state. Independent family courts with both juvenile and domestic relations jurisdiction have been established in only six states: Alabama (in counties of certain size), New Jersey (state wide), North Carolina (one county), Tennessee (one county), Virginia (state wide) and West Virginia (state wide). The courts of Missouri, Ohio and Oregon, as indicated, are distinct divisions of courts of more general jurisdiction, and the New York City and Newark courts already mentioned may be included as types of independent courts with domestic relations jurisdiction only. The Alabama, North Carolina and Virginia courts represent a type of court with fairly complete domestic relations jurisdiction exclusive of divorce, which would seem to indicate that this type of organization is characteristic of the southern states as a region. Sometimes the juvenile court has had its jurisdiction enlarged to include contributory delinquency or desertion or non-support without having its title changed to domestic relations court, or conversely the accretion of the title has not always meant very wide domestic relations jurisdiction. The famous family court of Denver, long presided over by Judge Lindsey, may be taken essentially as a type of juvenile court with some domestic relations powers.

A great impetus has been given to the movement for domestic relations courts by a committee of the National Probation Association which has functioned since 1916. The United States Children's Bureau has also shown great interest and in 1930 completed a survey of the growth of jurisdiction in children's cases and cases of domestic relations. The analysis shows that, while compromises have often been made

all along the line in most states, the court that sits in juvenile session or has a juvenile or family branch now has at least concurrent jurisdiction in cases of contributory delinquency or dependency, desertion and non-support, so that close coordination of juvenile and family case work is possible. Jurisdiction, exclusive or concurrent, in cases of offenses against children, commitment of mentally defective children, legitimation, guardianship or adoption is far less generally granted. Powers of guardianship or adoption even where included are often limited to cases where a delinquent or dependent child is before the court. Jurisdiction in divorce is most rare.

Thus many of the features of family court programs have gradually been incorporated into law in many jurisdictions. It is not difficult to discover the reasons why the unified clinical family court has not been completely realized. Constitutional obstacles have been the least formidable. The questions that have been raised have been based rather on grounds of expediency. There have been some suggestions recently in the direction of extending the jurisdiction of the family courts still further; for instance, to include control over the granting of marriage licenses, particularly where minors are involved. But on the whole a growing caution is to be discerned in the extension and consolidation of domestic relations jurisdiction. It is feared in the first place that some of the good now done by existing juvenile courts may actually be undermined, particularly in the large cities where these courts are already overburdened. A large addition of divorce cases, for instance, might make it difficult to specialize in children's cases, and the criminal or at least quasi-criminal procedure in desertion and non-support cases might invest the courts with an atmosphere detrimental to the consideration of children's cases. This can be avoided to some extent by the creation of separate divisions within the domestic relations court, but except in the larger cities there would not be enough cases to occupy each branch.

Far more fundamental is the question whether unified courts of domestic relations are based upon a correct analysis of present social conditions and possibilities in general and the situation of the modern family in particular. It is obvious that the latter does not have the unity which characterized the Roman family at one period of its history. The concept of the family rather than the individual before the

law is not quite in accord with the realities of modern family relations, which are subject to an extremely wide variety of disruptive influences of so complex a character that they are often quite beyond the remedial possibilities of even the most pliable legal technique. In order to make the latter effective it would be necessary to recognize as penal or at least quasi-penal a wide range of rather vague and relative offenses, which would certainly be dangerous in the absence of a complete system of scientific criminology. For instance, when domestic relations courts were created in Virginia, the rather vague crime of contributing to the disruption of a home was written into the statute.

Moreover, it is to be remembered that it is far less important that the family court be unified than that it possess adequate inquisitorial, supervisory and probationary powers, but it is quite generally admitted that this is beyond the possibilities of the courts as at present constituted. The working of present systems of probation is not encouraging, and the resources of really scientific social work would be severely strained. In other words, great care must be taken that the family court be not established prematurely before adequate social techniques are available to transform present judicial organization. The establishment of family courts must gradually involve an interstitial relaxation of the guaranties of criminal procedure in cases of injury to family relations, which can only be justified if a highly efficient and well developed social technique is available. At present it would seem to make little difference whether some crimes which may injuriously affect the family, such as selling cigarettes to minors, are tried in a court of domestic relations or the ordinary criminal courts. Where an offense against a child is a felony, it may be especially important that the safeguards of the ordinary criminal law be maintained in the interests of individual liberty.

The storm center of the movement for domestic relations courts has lain in the granting of divorce jurisdiction. It is here that the conflict between the regnant individualism and encroaching socialization has been most manifest. The reasons that have been found for accepting enlargements of jurisdiction in the interest of children have appeared less persuasive where the interests of adults are paramount or of equal importance. The extreme individualist sees in the transfer of divorce jurisdiction the first step toward treating adults like chil-

dren, and behind the demand for inquisitorial powers for domestic relations courts he perceives hardly more than a meddlesome passion for collecting better and more reliable statistics on the causes of family discord. His mind reacts violently against the idea that a court may act in a divorce case not upon the evidence the parties choose to present to it but upon knowledge secured for it by its own agents. Indeed, it cannot be doubted that the family court means an interstitial procedural attack not only upon the criminal law but also upon the freedom of divorce which has seemed to be gaining ground in the present century. The welcome which comprehensive courts of domestic relations have been granted in the southern states may perhaps be interpreted from this point of view.

The individualist attitude toward divorce jurisdiction is naturally closely bound up with group or class standards. Where the upper classes are concerned, a proceeding for divorce usually involves an adjudication of complicated or extensive property rights as much as the solution of personal relations, and for this the courts of general jurisdiction are better fitted. The divorces of the middle classes can doubtless be more easily handled by a court of domestic relations. But as far as the very poor are concerned desertion has been aptly termed the poor man's divorce; or, as Mowrer puts it in his *Family Discord* (p. 88), "Desertion characterizes the poverty group. Divorce on the other hand is confined to the middle and upper classes." These class cleavages are particularly prominent in the large urban centers, and they present the dilemma of erecting a domestic relations court with a judicial personnel which could economically deal with all classes of cases. A superior judge might be wasted on the lower class cases, while an inferior one would not be capable of coping with the upper class ones. But beyond this dilemma is the fact that by long association the domestic relations court in the large cities has practically come to signify a desertions court for the poor (and often the alien poor), with the result that a stigma has attached to it in the minds of the strongly individualist middle and upper classes. Such considerations are naturally less applicable where the divorce jurisdiction in the family court is only concurrent and where the court itself is not an independent one but simply a part of a court of general jurisdiction. It is interesting that the actual grant of divorce juris-

Encyclopaedia of the Social Sciences

diction has tended in this direction and has been conferred on the whole in regions that are fairly homogeneous in population and in economic status and that while urban are not megalopolitan. The movement for domestic relations courts is significant in connection with those urban conditions which have led to the creation of many types of special courts in the United States in the last few decades. But it is to be doubted whether courts of domestic relations can be completely realized as long as the prevailing individualism remains dominant and techniques of social adjustment are at their present levels.

DOMESTIC RELATIONS, LAW OF. See FAMILY LAW.

DOMESTIC SCIENCE. See HOME ECONOMICS.

DOMESTIC SERVICE, like other forms of labor, evolved in Europe through the various forms of labor relations—slavery, feudalism, indenture and free wage labor. Its peculiarity lies in its distinction from the other forms of labor, which have become less personalized rather than more so and have been removed from the home and consolidated into marketable commodities or services. The modern problem of domestic service is concerned with the shortage of labor which has resulted from the increasing failure of its status to attract and keep workers, despite undoubted improvements in wages and working and living conditions, rather than with the incidental problems of quality of work which arise in most labor relations. This problem becomes increasingly acute as certain branches of domestic service become commercialized and industrialized and as the lure of the comparative freedom of factory or commercial employment becomes stronger. These alternate occupations in domestic and personal service and in factory occupations were not available to women workers prior to the last quarter of the eighteenth century and were present for many of the men workers to a lesser extent than at present. This is perhaps more striking in the United States than elsewhere, although the "servant problem" is practically universal throughout Europe.

Up to the time of the American Revolution domestic service in colonial America, like most labor, was performed by transported convicts, indentured white servants or "redemptioners," "free willers," Negroes and Indians. Redemptioners, who sold themselves into service to pay for the cost of their passage, outnumbered Negro slaves in Virginia and Maryland until the latter part of the seventeenth century. From the revolutionary period until about 1850 the indentured workers were gradually supplanted in the north by free native born laborers. The social chasm that had existed between employer and employee diminished; the term "help" was almost universally used; there was an absence of liveries and all the distinguishing marks of service and an intolerance on the part of both employer and employee of servility and subservience of manner. In the south, on the other hand, as Negro labor entirely displaced white labor, the status of the servant became more servile.

Nevertheless, a downward trend in the status

of the occupation in the north was introduced by the immigration resulting from the Irish famine of 1846 and the German revolution of 1848. The faintly drawn class line changed into a caste line; native born Americans feared to lose social position by entering into competition with foreign labor and the native born women workers flocked instead into the new factory work, the prestige of which at the time was sufficient to attract the daughters of New England farmers, tradesmen and workers of the professional class. In the south the abolition of slavery meant merely that Negroes who had previously performed all domestic service for their personal expenses began to receive a small remuneration in money, but the occupation remained one scorned by native born white southern workers. In the far west after the discovery of gold in California Chinese coolie labor, made possible by the resumption of treaty relations with China in 1844, placed an equally strong social stigma on domestic service. Probably the only places in which the dignity of the occupation was maintained were in the mid-western pioneering communities where the housewife still actively participated in the work of the household, where native "hired help" competed only with immigrants to whom also domestic service was an occupation rather than a state of necessary servitude. It is in such communities that a servant group such as that portrayed in Willa Cather's *My Antonia* existed, if only for a short period.

The explanation of the stigma of domestic service in the recruiting of immigrants and the so-called inferior races might suffice for American communities whose democratic and classless distinctions held only for the native born. But it is challenged by the fact that in Europe, undisturbed by mass immigration, native born domestic servants had a status as low as that of the Negro, Asiatic or European in the United States. Domestic service grew directly out of feudalism, and after its abolition service became the chief occupation of the poorest elements among free laborers, an occupation from which men withdrew in increased numbers and for which women and children from the poverty stricken rural countryside were recruited. In a society in which class lines were unchallenged it was accepted by the domestic worker herself as the lowest type of occupation. It was an occupation untouched by such benefits as might result from organization through guilds. It remained for the faint social consciousness dimly awakened by industrialism to discover that in

London in the eighteen forties a large proportion of the most destitute women and prostitutes were domestic servants.

These caste lines defining the rank of the domestic servant were reenforced by the results of the industrial revolution, especially in the United States. Industrialism transformed the economic and social functions of the home. Before this revolution the middle class home had been a unit of production for exchange of recognized economic and social importance. With the advent of industrialism the economic functions of the home shifted largely from the making of goods to the rendering of services which were too often looked upon as menial, disagreeable and degrading. The persons who performed these services were accordingly looked down upon and considered of inferior social status. And so long as successive streams of cheap immigrant labor were available at wages which in the nineties averaged about \$2.50 to \$3.00 a week, there was little incentive to introduce the labor saving machinery devices and organization of household tasks which are now so widely advocated. Factory labor remained the more desirable occupation to the native born American woman until it too began to attract immigrant workers. The latter, imbued with the attitude transmitted to them by the community, were anxious to exchange the certain disadvantages of domestic service for the uncertain benefits of insecurity resulting from the "freedom" of industrialism, and as the demand for general houseworkers increased it became increasingly difficult, even in the face of successive waves of immigration, to secure sufficient labor for this occupation. The private employment agencies were unhampered in their activities among foreign born workers because of the omission of domestic service from the operation of the contract labor law, and they also sent recruiting agents throughout the South to encourage a northward trend of Negro labor.

So acute had the problem of domestic service become at the outset of the twentieth century that there began to be heard numerous faint stirrings of interest in the status of the servant. Prior to that time it had remained an uncharted field for economists and social historians, who although they might have questioned Adam Smith's dictum as to the valuelessness of domestic service did not consider it of great social or economic significance. Governmental bodies which had concerned themselves only with the gathering of data regarding industrial and com-

mercial occupations still remained comparatively untouched by the trend. The latest figures available in 1931 on the wages spent for domestic labor are those given by a report of the Industrial Commission in 1901, which stated: "There is no other branch of labor which directly affects so many people as does household labor, yet there is no branch of labor which has received so little scientific attention from either economists or people generally. In the wages paid to domestic employees alone, without reckoning the value of the board and lodging supplied to them, fully \$200,000,000 is expended annually. Any other industry which involved the expenditure of so large an amount of money in wages would not be left out of the field of economic discussion and investigation." Only recently have government figures begun to distinguish between those in household employment, those in public domestic service and those engaged in personal services outside the home. Both abroad and in the United States public or unofficial investigations as to the status of the worker were completely lacking; it was not until after Charles Booth's study of the occupation in his famous London survey that the English governmental authorities undertook a survey in 1899. In the United States Lucy M. Salmon of Vassar College in 1897 undertook her pioneer social history of domestic service, which included the gathering of data from 2000 employers and 700 workers. This study was the first to brush aside such perennial remedies for the situation as dependence on the golden rule and advocated the lessening rather than the increase of personal relations. In the same year the Domestic Reform League of the Women's Educational and Industrial Union of Boston made surveys of local conditions, opened a school for domestic workers, conducted an employment bureau which used a standard form of contract,

stimulated statistical surveys by the Massachusetts Bureau of Statistics of Labor and published for a time a quarterly bulletin.

Then there began a series of experiments, especially in the north Atlantic states, consisting of attempts to train skilled household workers who would then be hired by the hour. But, as I. M. Rubinow pointed out in a series of papers written between 1906 and 1910, it was a vain task to train for an occupation in which skill was constantly decreasing, since more and more of the skilled branches—such as the care of children—were leaving the home, and which, unlike nursing, to which it had been compared, could expect no increase of professional knowledge or standards on the part of the supervising agent or employer. In these papers, the first to make a study of the economic tendencies involved, Rubinow attempted to correlate the number in household employment with the increase in population, and the number of families with the increase in public domestic and personal service and in other types of occupations. He estimated that the demand for servants had doubled between 1870 and 1900 and that the supply had increased by only one half. According to his estimates population had increased 95 percent, the number of families 14 percent, the working population 132 percent, the number of working women 300 percent and the number in public domestic service as exemplified in the occupation of waiters by 357 percent; whereas those employed in domestic household service had increased by only 49 percent. A census estimate of the proportion of servants to the total population shows a decrease from 25.9 in 1870 to 17.3 in 1920; and if waiters, housekeepers and stewards are omitted, the figures show a decrease in the number of servants from 19.1 in 1900 to 13.0 for 1920. He predicted the declining importance of household employment with

TABLE I

NUMBER OF PERSONS 10 YEARS AND OVER ENGAGED IN DOMESTIC AND PERSONAL SERVICE IN THE UNITED STATES, 1880-1920

CENSUS YEAR	TOTAL NUMBER IN GAINFUL OCCUPATIONS	IN DOMESTIC AND PERSONAL SERVICE		IN DOMESTIC SERVICE	
		NUMBER	PERCENT OF TOTAL GAINFULLY EMPLOYED	NUMBER	PERCENT OF TOTAL GAINFULLY EMPLOYED
1880	17,392,099	3,418,793	19.7	1,075,655	6.1
1890	23,318,183	4,220,812	18.1	1,454,791	6.2
1900	29,073,233	5,580,657	19.2	1,560,721	5.3
1910	38,167,336	3,772,559	9.9	1,572,225	4.1
1920	41,614,248	3,404,892	8.2	1,270,946	3.0

the introduction of labor saving machinery and techniques for the organization of household tasks, most of which were at that time comparatively unknown, as well as the increase in the amount of commercialized domestic service because of urbanization, apartment and hotel dwelling, the hiring of special services and the like.

It was not until the period during and after the World War, when the shortage of domestic service became unusually acute and even the colored worker began to be recruited into factory labor or was able to enforce her preference for day work, that many of these reforms began to be initiated on a large scale. In this period household workers began to join the ranks of the hotel and restaurant workers unions, not only as individuals but to form locals of their own. Ten such locals were formed in 1920 and affiliated with the American Federation of Labor. The formation of unions in southern cities and the existence of a Negro local of 200 members in New Orleans were particularly noteworthy. These organizations, however, did not survive the post-war depression, and the period from 1920 on has witnessed a revival of training schools, mostly of brief duration, as well as of such organizations as the Scientific Housekeeping, Inc., of New York City, the Bureau of Household Occupations in Providence formed by the Housewives' League and similar bureaus in Boston, Hartford and elsewhere.

The Young Women's Christian Association was one of the first to begin a survey on a national scale of conditions in domestic service, which it is continuing at the present time. In 1924 the Woman's Bureau of the United States Department of Labor made an analysis of the records of the Domestic Efficiency Association in Baltimore, and in 1927 cooperated with a group of Quaker women in Philadelphia in a survey and helped to found a permanent organi-

zation. More recently, as a result of the Conference on Employer-Employee Relationships in the Home held in Washington in October, 1928, a permanent Committee on Employer-Employee Relationships in the Home was established for research and experimentation upon such questions as the nature of the jobs to be performed, information as to varying types of employers and employees, the possibility of establishing adequate public or semipublic employment agencies and if possible a national clearing house, vocational training and agencies for the education of the public concerning the problem. Also, since the number of Negro workers in the field has been increasing, special studies have been made of their role in the industry.

As a result of these studies and endeavors information has been secured on the number of persons employed in the various branches of domestic service, the proportion of men and women so employed, and the changing proportion which women in domestic service form of the total number of employed women. Scattered individual community surveys have been made of hours and wages, of work preferences, of living and housing conditions. As yet, however, no real national survey has been attempted. Table I based on census data shows the decreasing importance of domestic and personal service in relation to the total gainful employments, but allowance must be made for the fact that the scope of the domestic service classification was somewhat changed during the period covered. Nor do the census data allow of separating with any degree of certainty household domestic service from that in commercialized enterprises, but there is no doubt that if such figures were available they would show a far greater decrease in the amount of household employment.

While Table II covers only women employed in domestic and "kindred occupations" in 1910

and 1920 it offers a clue to the racial and national composition of the whole group of domestic workers. The proportion of Negro workers, the largest racial group in this occupation, varies over the country. In Baltimore of 2800 household employees studied 68.9 percent were Negroes; in the Philadelphia study of the women 43.3 percent were colored, 16.14 percent native born white and 42 percent foreign born, and for the men the figures were respectively 44, 24 and 32 percent.

The distribution according to sex of the persons employed in domestic and personal service shows a decided increase in the percentage of women employed—from 34.6 in 1880 to 64.2 in 1920. The proportion of women is no doubt still greater in domestic service only, and highest probably in household domestic service. As compared with other industries, however, domestic service is of declining importance as an occupation for women; the number employed in domestic service and "kindred occupations" dropped from 60.7 percent in 1870 to 18.2 percent in 1920 of all the women employed in non-agricultural pursuits.

This decline in importance of the occupation is illustrated also by the startling changes shown by figures as to labor turnover, available, however, only for scattered communities and for groups not always comparable. As early as 1890 the average tenure of service of a domestic worker in the United States was less than eighteen months; in the city of New York the modal period of employment for 24 percent in a period from 1906 to 1908 was estimated at from six to eleven months, 17 percent served from one to two years and 14 percent three years and over. In 1922 in the city of Washington, of 1000 houseworkers placed almost 60 percent remained in positions from one to three months only, 10 percent about four months and over and about 30 percent one week and less. The modal period for colored workers was from three to six months, whereas in a study of colored domestic workers in a selected section of Philadelphia in 1900 the average period was slightly less than five years. From a perusal of the literature on the subject one would reach the conclusion that the bulk of this turnover is to be attributed more to the wish of the worker than to dismissal.

Equally scattered is the material on wages, hours and housing accommodations which might explain the failure of domestic service to hold its own as an occupation. Nevertheless, from such material as exists it would seem that wages

rose in the north and the middle west from a weekly average of about \$2.50 or \$3.00 for general workers at the outset of the century to about \$10 or \$15 for general houseworkers and \$15 or \$18 for skilled workers at the present time, exclusive of room and board, with a somewhat higher wage level in New York and Boston and lower levels in southern and rural sections. In general, moreover, the foreign born receive higher wages than the natives, due partly to the fact that there is such a large proportion of Negroes among the native born. The wages of men engaged in domestic service are higher than the wages of women. While there is a tendency toward an increase of wages with length of service, there are no generally accepted standards. If allowance is made for room and board, the actual money wages probably compare favorably with those paid to unskilled factory labor. A study of wages in Chicago based on 3500 advertisements of "experienced white females to do general housework" showed that real earnings increased from 1900 to 1914—they were 25 percent more than they had been in the nineties; but from 1914 to 1918 real earnings fell 20 percent. When hours of labor, however, are taken into consideration the actual hourly earnings are low. According to W. I. King, during the twenty years preceding 1914 very little advance occurred in the wages of domestic servants, but during the war of 1914-18 their wages increased about 150 percent. Since the war the decline in the wages of public domestic servants has not been as great as that in many other fields, but they are still below those in the majority of industries.

Both the actual hours and the overall hours in domestic service are long. In 1890, 38 percent of women domestic workers actually worked ten hours a day, 6 percent eleven hours, 31 percent twelve or more, with only 25 percent working less than ten hours a day. In the city of Washington in 1922, 750 out of 1000 domestics (exclusive of day and part time employees) worked more than ten hours a day. The overall hours for men are shorter than for women. In Philadelphia they averaged eight hours and over for the men but under ten hours for 32.6 percent; and for the women an overall of twelve hours and over but under fourteen hours for 51.7 percent. The actual hours of the men coincided more nearly with their overall hours than did those of the women. A large percentage of the women employed as cooks, general houseworkers, chambermaids, waitresses and chil-

dren's nurses are reported by their employers to have worked ten hours or over daily. A few of both the men and women were reported to have been on duty twenty-four hours in the day.

These conditions are, of course, far truer for those who "live in" than for those who work by the day or hour. Small wonder then that the general custom of "living in" is unpopular. Curiously enough, in the Baltimore study mentioned, of 1358 women both Negro and white 49.7 percent expressed a willingness to live in, 37.6 percent preferred to live out, 8.5 percent were willing to live in part of the time and 4.3 percent had no preference. In Philadelphia 60 percent of the women and 21 percent of the men lived in their place of work. In recent years the aversion to "living in" has not been caused by bad housing and food, as it formerly was in America and doubtless still is in Europe. It is probably truer of the colored worker, however, that her living conditions in the house are less desirable than those of the white worker. Out of 500 Negro domestics interviewed in Washington, 64.1 percent of whom were requested to sleep in, 83 percent were offered basement rooms, 10 percent third or first floor rooms, and 7 percent were offered attics or received no definite statement.

On the other hand, domestic service for the colored worker, whether "living in" or working by the hour, does not carry with it the same degree of social isolation which it does for the white worker except in rural or suburban communities. In the first place, a greater percent are married. The age and marital status of the workers differs widely for several groups. A study of 975 colored servants showed 54.2 married and 10 percent widowed, separated or divorced, whereas for 450 white women the figures were 30 percent married and 17 percent widowed, making comparative totals of 55 percent as against 46.5 percent. According to a study in Philadelphia of both colored and white domestic workers, the majority of women so employed were under thirty-one and 51 percent of them unmarried, and the majority of men were over thirty and only 28.3 percent were unmarried. By comparison, 1921 figures for Greater London showed that of 276,446 women in domestic service only 8.2 percent were married, whereas in the other personal service groups, with the exception of waitresses and barmaids, charwomen and office cleaners and laundry workers, married persons predominated.

The white domestic worker is shut out from the ordinary social groupings. According to a study made in 1910 of 2300 white domestic workers under thirty in the state of Michigan, only 51 belonged to fraternal societies. Among the colored workers this isolation is not so complete; 7 out of every 11 Negroes are listed as church members and the large majority of those in domestic service are so affiliated, but even here, according to a survey of the Negro in domestic service, the dictum that the "more intelligent" do not enter the service casts a shadow over their status.

There seems to be little hope for improvement through unionization of domestic workers in the United States, although such organization might follow the formation of employers' groups. On the permanent committee on employer relations, for instance, there is but one trade union member, a representative of the National Women's Trade Union League. Such improvements as have come have been in wages, and working conditions have largely been enforced by shortages in this field. This failure to organize and the general disrepute of domestic service may explain the almost complete exemption of this branch of women's work from social legislation. With the exception of the interest taken in the problem by the Women's Bureau of the United States Department of Labor, government bodies have scarcely taken cognizance of the problems of domestic labor. Although the number of child laborers has decreased considerably, both absolutely and proportionately to the total—the decrease in the number of children in domestic service between 1910 and 1920 was 51.9 percent—it cannot be claimed that this has been due to child labor legislation, for child labor laws completely omit mention of domestic service. Regulation of the hours of those women workers over sixteen occurs in only one state, Wisconsin.

According to the survey made in 1924, in no states do accident compensation laws compel employers and employees to operate under the law; in one state, New Jersey, employers and workers in all occupations, including household labor, were given option of registering under the law if both parties agreed; some states provide for optional insurance. The exemption from accidents and health insurance is not justified by the conditions prevailing in domestic service: in 1913 of 180 domestic workers carrying insurance of their own there was an excess of 50 percent over the expectancy of death.

The European situation represents a decided contrast in the matter of social control. Especially in the Germanic countries social legislation fixed the status of both employer and employee. For a time the only organizations of workers were the institutions of a semiphilanthropic nature which were provided for their aged and sick. After 1906, however, trade unions, both of "free," or social democratic, and of Christian labor affiliations, began to develop. The membership of the free unions was over 30,000 in 1919. The Christian unions were especially effective in Bavaria, where in 1919 their federation had 126 branches with about 15,000 members. It is in Bavaria, incidentally, that the high standard of a ten-hour day is fixed by legislation. The legislation on domestic service since the beginning of the German Republic is based on a scheme of collective bargaining. For instance, in Berlin the national board which determines all vital points in the employer-employee relationship is composed of representatives of the domestic servants' unions, of housewives and of the public through the public employment exchanges. In 1928 there was published in the *Reichsarbeitsblatt* the result of a thoroughgoing study of the effects of the new law on wages and working conditions.

Similarly, in Sweden organizations of houseworkers are reported to have fifty branches, and are represented on all bodies determining social legislation and providing training for domestic service. Sweden is named in a survey made by the world Y. W. C. A. in 1930 as the one country in which no social stigma attaches to the occupation. In Russia in 1926 the number of organized workers in domestic service included about 133,000 who were governed by the same labor code as other workers, but these were mostly workers in hotels, restaurants and institutions. The private domestic servant still exists in the homes of nepmen, professional and official classes, intelligentsia and members of the aristocracy. In Switzerland also it is the day workers who are organized and who enjoy high wages and legislative protection. In Holland a general housewives' league of seventy branches has over 27,000 members including 2000 domestic workers.

In Great Britain the Domestic Workers' Union, organized as early as 1911, has had a large share in such improvements as have come about in the status of the domestic worker. This union is represented on all official and semi-official inquiries into the problem as well as on

the bodies which administer unemployment insurance to those workers in domestic and personal service who are not employed by private households. It played a part in the extension of health insurance to cover the domestic servant and is now agitating for the extension of unemployment insurance to those in private households. It is true that its membership is largely recruited from those outside of private households. But with the granting of the franchise to younger women, making eligible a large number of those in private households, increased attention is being paid to their problems by the Labour party as well as by the union of domestic servants. Domestic workers still remain untouched by hour legislation for women and children. The 1923 Governmental Committee of Inquiry added to the recommendations of the 1919 body (the Women's Advisory Committee of the Ministry of Reconstruction of Great Britain) provision for specific regulation.

The actual conditions of work and wages as stipulated by European legislation do not on the surface seem superior to those of the American worker. They include such revelatory provisions as that the room of the domestic worker is to have a lock on the inside, that she is to have the privilege of at least one bath a week or to be given an allowance which will permit her to go to the public baths, and the like. The overall work period provided for in both German and Austrian legislation of 1920 is usually thirteen hours, with two hours for meals and restrictions that only light work is to be done after 7 P.M. and overtime compensation to be given after 8 P.M. Child labor under sixteen is usually restricted to ten hours with three hours for meals. The provisions for one to three weeks' vacation with pay depending on the length of service, free medical care, two weeks' notice of dismissal or leave or pay for full period of notice if discharged without reason, a bonus of three months' pay for those over ten years in service with increasing amounts for each additional year, are, however, superior to the American regulations. Yet these conditions must be compared with general labor conditions in each of these countries; they mark the beginning of a program of conscious social control instead of a reliance on the uncertainties of the labor market or the whim of the individual housewife.

Nevertheless, in practically every European country, as in the United States, there is a shortage of domestic labor of such proportions as to constitute a problem, especially in view of

the fact that in Europe it is even less compensated for by changes in the nature of the household organization and by apartment and hotel living among the middle and upper classes. In Germany it is estimated that the number employed in domestic service dropped from 40 percent of all occupied persons in 1882 to about 12 percent in 1919; in this instance, however, middle class poverty as well as increasing industrialization was a factor to be considered. The exact trends are difficult to estimate because of differences in classification of domestic and personal service. An attempt to analyze these trends has been made by Wl. Woytinsky in *Die Welt in Zahlen* (vol. ii, p. 72-75, with explanatory notes as contained in chapter i, Berlin 1926). Wide discrepancies in trends are due partially to these different methods of compilation, but the failure of household employment to hold its own is undeniable.

To meet this shortage there is needed widespread public recognition of the necessity for training both houseworkers and their employers, and such training is part of the scheme of European public and vocational education in continuation schools and elsewhere. On the governing boards of the bodies responsible for the supervision of educational plans there are usually representatives of employers' and employees' organizations, and the well ordered scheme contrasts sharply with the haphazard training provision under the supervision of commercial and semiphilanthropic bodies in the United States.

A survey of these general developments shows far greater acceleration in the United States in the introduction of labor saving machinery, devices and home organization and the use of personal services and commodities outside the home. In European countries the tendency is rather more toward the control of working conditions.

The healthiest sign everywhere is the almost universal expression of displeasure at the unnecessarily feudal nature of domestic household employment. In America it has been individualistic and unorganized, gaining recognition only as increasing shortages have brought about studies of actual conditions prevailing. In Europe the organization of domestic workers and the expression of their point of view have led to a change, although very gradual, in the general social attitude. That change can perhaps best be traced in popular periodical literature and in the novels and plays of the time. There is a great difference between the attitude of Daniel Defoe

as it is expressed in his essay *The Great Law of Subordination Considered, or the Insolence and Insufferable Behavior of Servants in England Duly Inquired Into* (London 1724) and the recent conclusion of an English employer, Ernestine Mills, in *The Servant Problem* (London 1925), that the problem can by no means be approached on the basis of the personal kindness of the individual employer.

A survey of these conditions makes it quite clear that in order to draw to itself skilled and reliable workers domestic service must be so changed that it becomes a self-respecting occupation. Whereas in Europe the impetus for such a change seems to be given largely by workers' organizations, the mobility of the American worker makes it necessary to look at the moment to other agencies. One of the first essentials for such a change is that those who are in charge of the occupation must understand the principles of sound personnel procedure, including wise administration and management, the selection of the worker on the basis of the type of the job and the careful supervision of the workers when placed. Increased skill and ability must be recognized, wages and hours must be standardized (even in middle class households with younger children, where an eight-hour schedule seems impossible) and the workers must be advanced as they are able to master new and more difficult tasks. Adequately staffed employment agencies will also be of great influence in building up this occupation. Organizations of employers for the necessary group study and action will be formed. Such study may also raise interesting questions as to whether the adult members of the family, men and women alike, who require service for themselves or their children produce enough either in the home or outside of it to justify the employment of workers to serve them. Such inquiries are closely bound up with social attitudes, which involve revaluations of current classifications of productive and useful labor.

DOMESTIC SYSTEM. *See* PUTTING OUT SYSTEM.

DOMESTICATION is a term generally conceived as applicable to the plants and animals which man has adapted to his use. A group of German anthropologists and comparative anatomists have, however, approached the problem of domestication from the point of view of the

physical characteristics of domesticated animals and the conditions under which they live rather than from that of their association with and usefulness to man. This approach has resulted in a series of criteria which have materially broadened the usefulness of the concept of domestication and have clarified the analysis of the phenomenon.

The criteria drawn from the conditions of domestication are four in number. When contrasted with wild forms the domesticated animal lives in a restricted habitat, is accorded protection from the weather and from predatory beasts, has a food supply assured in quantity and different in kind from that of animals of similar genus who live in the wild form, and breeds under controlled conditions. The traits of the domesticated animal which differentiate him physically from the related wild forms are found in the color of the skin and eye; in the color, form, thickness and length of hair; in the configuration of parts of the face such as the nose, mouth and eyes; and in bodily size and proportions. An outstanding characteristic of domesticated animals is the increased variability they manifest in the traits mentioned, when they are compared with corresponding wild forms.

The two hypotheses most often advanced to account for the domestication of animals, which may be termed the pet and totem theories, are in the nature of pure speculation and must be viewed as interesting attempts made by the early anthropologists to excogitate "origins." Granting the validity of these two hypotheses in certain cases, it is also quite possible that certain animals, such as the dog or ox, in early times found association with human beings to be congenial and as a result a condition of domestication grew up. In certain instances, as Laufer has shown, animals seem to have been domesticated purely for religious purposes as well as because of their totemic significance, as is the case with the pig and chicken in southeastern Asia, where these animals are used in accordance with a deep lying pattern of divination. In the case of certain animals man may at once have recognized their economic importance and because of this tamed and later domesticated them. Thus the search for the original causes for the domestication of animals is checked by lack of historical evidence and by the great differences found the world over in the uses to which domesticated animals are put. This observation holds true even when reasons are sought for the domestication of a single animal, such as the cow, which most

writers assume was domesticated for her flesh and her milk. Laufer shows that among the Chinese the use of milk is looked upon with abhorrence in spite of the numerous animals these people possess that are capable of being milked, while in east Africa cattle are bred for reasons of social prestige rather than for the meat or milk they give, although these are utilized on occasion.

As far as is known palaeolithic man never achieved the taming of either plants or animals. Some authorities hold that the dog was domesticated in late mesolithic times, while early in the neolithic period European man domesticated the dog, the horse, the sheep, the ox, the goat and the pig; and his domesticated plants included wheat, barley, millet, peas, lentils, flax and poppies. In America the llama and turkey were added to the list of domesticated animals, while the Indians domesticated many plants, such as maize, tobacco, squash, numerous varieties of beans, the pineapple, the pumpkin and many others. Western Europe has bred the mule, Asia the water buffalo, Africa and Asia the camel, and the reindeer has been domesticated in the circumpolar region. All of these animals are of major importance to the people who possess them.

The command of the techniques of domestication and breeding has always a far reaching effect on a culture, although the degree of domestication in which animals and plants are held varies widely from culture to culture. There are vast differences in plant raising between the mechanized, highly specialized and intensive agriculture of the great wheat farms of the United States and Russia and the primitive Australian's attempt to scratch the ground with a digging stick and, in the instance of animals, between the extremely close domestication to which breeders of race horses or pedigreed dogs subject their animals and the casual type of loose domestication under which the reindeer herds of the Chukchee of northern Siberia are kept. Yet even the loosest kind of domestication of food animals and the crudest type of plant culture assure a food supply that culminates in a social surplus. The acquisition of the dog must have greatly assisted primitive hunters, as it extended their powers and gave them an important ally against the wild beasts they were attempting to kill. The horse as an aid in the rounding up of large herds of gregarious wild animals was readily seized upon by the hunting tribes of Plains Indians in North America when

introduced by the Spaniards. Fast horses also made for more efficient warfare on the part of warrior tribes of the plains, of Mongolia and of the Sahara. A herding people is less sedentary than a people which subsists by means of agriculture and is less able to acquire social surplus than the latter. In certain cultures, such as those of east Africa, both domesticated plants and animals are of great importance, but ordinarily one is subsidiary to the other if both are found in one culture. The outstanding result of the predominance of agriculture among a people is the potential ability of a given area to support a larger population than if it were utilized for herding, and concentration of peoples has been and is found in regions where agriculture holds sway.

One result of the introduction of domesticated animals in a culture is a characteristic division of labor between the sexes whereby the care and working of the larger animals devolves upon the men. On the other hand, women usually tend the domesticated plants in cultures where agriculture is practised. The seeming contradiction to this principle which contemporary culture presents is only an exemplification of it, for where through the introduction of the plow an animal is associated with agriculture, the man takes over the care of the plants. Likewise, although pottery is the work of women, the men become the potters when the wheel associated with the draft animal is employed.

When the criteria of domestication arising from the conditions under which domesticated animals live and those arising from the physical characteristics which distinguish domesticated animals from wild ones are applied to man, the evidence leads to the conclusion that man is to be regarded as a domesticated form. Culture may be said to have been the domesticating factor for man, for with the development of culture, especially the knowledge of the use of fire, the requirements set by the criteria of domestication are fulfilled. With these came a restricted habitat, for with fire came the hearthstone, the concept of home as a place to which man might return and feel at ease both with the human habitants and the supernatural forces lodged there. Before the time of Neandertal man, who was probably the first to use fire, the deep deposits in the European caves that bespeak a long continued occupancy are not found, while at the center of the Mousterian deposits ashes are found that indicate the presence of a communal fire. With the use of fire and the development of

culture man became able not only to withstand predatory animals but to maintain himself against hostile human groups. Likewise the cultural patterns of a people have from a very early period fixed the kinds of food utilized for consumption in a manner quite analogous to that in which the breeder determines the food of the animals under his care. Tabus against eating certain foods and positive traditions as to the most desirable kinds of food are found everywhere. With fire man had in addition the means with which to preserve food, which made his supply of comestibles as certain as is that of the domesticated lower forms. Society through its traditions also breeds man in a manner analogous to that in which the breeder breeds the lower forms. Cultural ideals of beauty or traditions regarding the spiritual advantage or danger associated with such physical characteristics as red hair, albinism or other traits make for selection in mating and thus help to preserve or stamp out certain types.

Further evidence which points to man as a domesticated form lies in his physical characteristics. Man is much more variable than any of the related anthropoid wild forms, as the dog is more variable than any species of wolf. Further, the outstanding traits by means of which races are differentiated are the very ones which characterize the domesticated animal. Variations in the color of eyes and skin, in the color and form of the hair, in the amount of body hair in the male, in the shape of the nose, lips, mouth and eyes, in bodily size and proportions, that occur from one human group to another parallel variations found in the various kinds of other domesticated animals.

The implications of the conclusion that man is a domesticated animal are not inconsiderable. Granting that great variability and instability in physical traits are characteristic of animals under domestication, it follows that the character of all but perhaps the current major racial divisions is precarious. Also, if culture has domesticated man and has thus aided in bringing about and maintaining the physical characteristics used in differentiating various groups of human beings, then in considering the relationship between race and culture not only the extent to which race plays a part in the determination of the culture of human groups must be investigated but also the extent to which culture has played a role in the determination of physical types.

DOMICILE may be defined as the place with which a person has a settled connection for legal purposes either because his home is there or because the place is assigned to him by the law. The word and the idea are derived from the Roman law; the word might be accurately translated homestead. Every one must have a domicile, but no one may have more than one. At birth a child takes if legitimate the domicile of his father, otherwise that of his mother, as his domicile of origin; during the child's minority his domicile changes with that of his parent. The normal adult may at any time acquire a new domicile of choice by acquiring a residence in fact with the intention of making it a home. Residence is not a "word of art"; it means a factual dwelling place of more than mere temporary occupancy. The word is often used in statutes and is usually there interpreted as meaning domicile. When a woman marries she takes the domicile of her husband and keeps it until she may legally live apart from her husband, in which case she may legally acquire a separate domicile. A domicile once acquired continues until another is acquired.

Many countries whose law is derived from Rome have followed the lead of France in the *Code Napoléon* and have substituted nationality for domicile. The latter, however, retains practically all of its importance and governs many legal situations and transactions in England, the dominions and the United States. Political rights and obligations, such as the right to vote and hold office, the obligations of military and jury duty, the obligation to pay certain taxes and the jurisdiction of a court over a person are

all fixed at the domicile (*see* PUBLIC OFFICE; SUFFRAGE; TAXATION). Attempts to evade the law by claiming a false domicile for the purpose of voting, holding office or paying taxes may be successful if they are not challenged by litigation. A man may thus successfully claim domicile where he is politically established, although he has moved his home elsewhere, or in the country, where taxes are low. If the claim is ever legally disputed, however, the court will enforce the legal principle and declare the domicile to be where the real home is.

In many states in the United States a candidate must be domiciled in the very district which he desires to represent; in others he need only be domiciled within the state; but the custom of electing a person from within the district is so strong that there are few exceptions and those short lived. The result of these restrictions is a lowering in the character of the elected representatives, since many districts do not contain men of sufficiently high ability and public spirit.

The law of the domicile is applicable to the inheritance of movables and to marriage, divorce and other questions of domestic status (*see* FAMILY LAW). Attempts are frequently made to evade the law by claiming a domicile in a state which grants easy divorce. This is illustrated by the divorces sought in Reno, Nevada, and formerly in Paris. The question of domicile is, however, a jurisdictional fact which may always and anywhere be reopened; hence divorces so obtained may be held invalid. Such a divorce has only a social effect, but this is all that the claimant desires. Furthermore, it is unlikely that the validity of the divorce will be questioned.

The domicile of a corporation is in the state where it is formed. Since associates desirous of incorporation are likely to form their corporation in the state whose laws are most liberal to corporations, irrespective of the state where business is to be done, the domicile may have no connection with the real seat of the corporation's activities. While the problem of foreign corporations would inevitably arise in the United States as a result of state incorporation for business on a national scale, the tendency of corporations to incorporate and so acquire domicile in certain states has served to complicate the problem.

Under the laws of some states domicile is an important factor in determining citizenship. A citizen of the United States automatically acquires citizenship in a particular state by establishing a domicile there and loses citizenship in

that state by relinquishing this domicile. In many Latin American countries children born abroad of native born citizens acquire citizenship automatically by establishing a domicile in the country of which their parents were citizens. Women who have lost their citizenship through marriage may, as in Bolivia and Peru, automatically reacquire their original citizenship after the termination of the marriage by establishing a domicile in the country of which they were originally nationals. Uninterrupted domicile for a definite period of time is generally required as a condition of naturalization, although this may be dispensed with if other conditions are met, such as owning real property or having children born in the country, as in Mexico and Brazil. A naturalized citizen of the United States is presumed to have lost his citizenship (except in time of war) by establishing a domicile for two years in the country of which he was a national before he became naturalized or for five years in any other foreign country.

There is nothing in the theory or practical operation of the law of extritoriality repugnant to or irreconcilable with the acquisition of domicile by an individual in a country in which his own country has been granted privileges of extritoriality. Thus an American citizen may acquire a domicile in China and still remain subject to the law of the United States as applied by the United States to its citizens residing in countries with which it has treaties of extritoriality.

In war time according to British and American practise domicile determines the status of the individual and his goods. Not only does personal domicile in enemy territory confer enemy character upon the individual and his goods, but under the doctrine of hostile commercial domicile possession of a house of trade or branch in enemy territory even without personal residence there lends enemy character to the property so employed. The governing principle is that all individuals and property located in enemy territory contribute to the resources of the enemy. France and most European countries determine enemy character for both the individual and his goods on the basis of nationality. The conflict of the two theories became acute during the World War and has not yet been solved.

DOMINICAN FRIARS. The Dominicans were an order founded by St. Dominic in southern France in 1206 and officially authorized by Pope Honorius III in 1216. In point of evolution the friars, or *fratres*, represented by the Dominicans, or Black Friars, and the Franciscans, or Grey Friars, were a new type of order standing midway between the older monastic orders, whether of monks or of canons, and the subsequently developed bodies of clerks regular, of which the best known example is the Society of Jesus. While the friars continued the monastic tradition of choral psalmody, which the clerks regular later discarded, they were separated from monasticism by important differences arising largely from a fundamental difference in purpose. The monks and canons sought isolation and therefore retreated into rural districts; they took a vow of stability and therefore remained on principle in one place. The friars, on the other hand, were established to deal with the swiftly developing town life and to facilitate their work were allowed to move freely from house to house, from city to city and from country to country. Thus Aquinas taught in Paris, Bologna, Naples; Vincent Ferrer preached in France, Spain, Italy and the Germanies; Jordan of Saxony visited Oxford and died in Palestine. The constant contact of the friars with the lay world was also a necessary consequence of their vow of mendicancy. This vow, imposed by the founders as a means of avoiding the worldliness which had victimized the richly endowed monasteries, gave to the Dominicans and Franciscans the well known name of mendicant orders. It was the friars who perfected the highly unified system of control which was later adopted by the clerks regular and which represented a complete contrast to the long prevalent Benedictine tradition of autonomous monasteries. With a master general at the head each order was divided on national and linguistic bases into provinces, subject to the power of visitation from the center and able to control the

center by means of general chapters and meetings of representatives of the local groups. There had been some foreshadowing of this wide unity by the Cluniacs, who did not, however, combine their machinery of centralization with the same measure of provincial organization and autonomy, and by the military orders through their system of provincial groups called *langues*; but the real beginning of a modern religious order was with the friars.

While in its broad aspect the work of the two orders of friars tended toward the same result, it was St. Dominic and the Dominicans who left the most powerful impress upon institutional development. With the insight of a gifted legislator St. Dominic himself gave no definite constitutions to the order: he merely accepted the rule of St. Augustine as a framework to comply with the wishes of the pope and waited for time and experience to prove what should be necessary to the establishment and unfolding of his ideals. It was he who developed as a new and liberating force in religious life the idea of representation and election, which again had been foreshadowed less democratically by the Cistercians and the Cluniacs. Each house was to elect its own conventual prior; each group of houses within a kingdom or considerable province was to gather in a provincial chapter, consisting of the prior and a representative of each house, and elect its own prior provincial; on the death or resignation of the master general the prior provincial and two other electors representing each province met in a general chapter to elect a new master general. In addition each of these chapters met annually as the supreme legislative authority within its respective sphere. Thus the inevitable effect of Dominican influence has been in favor of constitutional authority. It is arguable that the English Parliament, beginning its new career under the auspices first of Simon de Montfort, St. Dominic's godchild, and then of Edward I, whose confessor and friends were Dominicans, owed some of its features to this Dominican influence. So too the theory of representative government in ecclesiastical matters evident in convocation can be traced to a Dominican parentage. Not merely through the indirect influence of its constitution but through the direct participation of its members in the problems of secular social and political life, the Dominican order has frequently stimulated the growth of constitutional freedom; Antoninus of Florence, Savonarola, Las Casas, Lacordaire, were from amongst its ranks.

The purpose which the constitutional organization of the Dominicans was intended to serve was "preaching and the salvation of souls"; preaching being interpreted not in its moral sense but in the sense of the dogmatic exposition of the creed. This purpose was to be achieved by preachers trained by a combination of scientific university education and rigorous monastic life. Going to the university to study the friars remained there to teach, gathering to their ranks recruits among the students and professors. The result was an immediate awakening of the religious spirit in the great intellectual centers of Europe. The constitutions of the order also provided that a professor must reside in each of the priories established outside the university towns. During the scholar crisis of the thirteenth century occasioned by the drift of all scholars to Paris the Dominican priories located in cathedral cities were accepted even by the bishops as the authorized theological schools. Soon all the theological teaching of Christendom was in the hands of the friars. Since on its fringes Christendom touched the Arab countries and included the dispersed Jews, Dominican centers were established in Spain and north Africa, where Hebrew and Arabic were taught by Islamic or Jewish professors. Moreover, the preachers carried the life of the Dominican order as well as its message to the Near East, to Persia and Palestine, to Arabia and China and westward to Iceland and Greenland. Later South America, South Africa and Japan were the scenes of their labors. Because the Dominicans were theologians they were brought in as experts to examine those denounced to the Inquisition for heresy and despite their protests were eventually compelled to take over the organization of the Inquisition in many lands. Thus they touched public life at many points. But it was the apostolic purpose conceived by St. Dominic which pervaded all their activity; which inspired Aquinas in philosophy, Albertus Magnus in natural science, Antoninus in social science and Fra Angelico in art; which led Savonarola to struggle for the independence of Florence, Las Casas to protect the oppressed and Giovanni Dominici to undertake projects of educational reform. Friars Preachers is their official title and describes them best.

DOMINION STATUS. The term dominion status has become current in British political circles since 1921, when the territory now known as the Irish Free State was conceded a status corresponding to that of Canada and the other self-governing dominions. This status was officially defined by the imperial conferences of 1926 and 1930. Under the definition of 1926 the United Kingdom and the dominions are "autonomous Communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, though united by a common allegiance to the Crown and freely associated as members of the British Commonwealth of Nations." But it was added that "the principles of equality and similarity, appropriate to status, do not universally extend to function." The sovereignty of the dominions is thus limited by allegiance to the crown of the United Kingdom and voluntary association with the other members of the British Commonwealth. As a result of the historical evolution of the conception dominion sovereignty is still subject to certain legal limitations which are in process of dissolution but of which some may persist for some time.

The conception of dominion status was in fact arrived at by American political thought in the last years of the conflict with the United Kingdom over the measure of authority possessed by the king in Parliament as regards the colonial empire. Familiar with the virtual autonomy long enjoyed in the colonies and fortified by the precedent of the relations of the United Kingdom and Hanover, men like Adams in 1774 had no difficulty in maintaining that the colonies were united to Great Britain only in a personal union through the king. But legalism triumphed in the United Kingdom; and George III and his government, refusing to accept Burke's doctrine that the supremacy of the imperial Parliament was no justification for taxation of the colonies, declined to yield until in 1778 under pressure of

rebellion they tentatively and ineffectively suggested the conclusion of peace on the basis of the reorganization of the empire as an alliance of autonomous communities. The rejection of this offer and the loss of the American colonies resulted in the adoption of a new theory of colonial government and its application to the colonies acquired in Africa, Asia and Australasia during and after the Napoleonic wars. Representative government had led to revolt; henceforth the governor under imperial control was to have full authority executive, judicial and legislative. Concessions had indeed to be made. The assemblies of Nova Scotia and its offshoots, Prince Edward Island and New Brunswick, could not be suppressed, and the influx of loyalists and others from the United States compelled the reversal of the policy of 1774, which had made Quebec a crown colony. But while assemblies were conceded in 1791 to Upper and Lower Canada, precautions were taken to prevent their controlling the executive. The governments were supported by imperial garrisons and provided with funds from imperial taxation or crown revenues to render them independent of the legislatures, while the establishment and endowment of the Church of England in Upper Canada and the favor shown to the Roman Catholic church in Lower Canada were relied upon to counteract democratic tendencies in the former province and racial antagonism in the latter.

It proved impossible to deny permanently to British subjects in the colonies the rights claimed by their fellow subjects in England. To William Baldwin and Joseph Howe in Upper Canada and Nova Scotia belongs the merit of first seeing clearly the solution of the constant struggles between executive and legislature. British political opinion was slower to accept their solution, largely because the situation was obscured by the racial strife in Lower Canada, which suggested that the demand for self-government was prompted by disloyalty to the crown. It was therefore only the revolts in the two Canadas in 1837 which led to a vital reconsideration of the issues and to Lord Durham's famous mission. His report in 1839 (ed. by C. P. Lucas, 3 vols., Oxford 1912) led to the introduction of the system of responsible government into Canada (1841-48). The new system was based on a dichotomy which classified the functions of government as internal or imperial. Over the former full power was to be exercised by ministries on the British model responsible to elective

assemblies, while in matters of imperial interest the decision was to rest with the imperial government and Parliament. It was recognized that the system involved a delicate balance of authority and that in the long run ministers would not acquiesce in exclusion from the control of any aspect of colonial policy. But it was wisely felt that the system would solve the immediate difficulties and that the extension of the responsibility of ministers should be allowed to develop naturally.

The new system was first made operative in Canada, constituted by the reunion in 1840 of the two provinces of Upper and Lower Canada, in Nova Scotia, New Brunswick and Prince Edward Island. Newfoundland, considered merely as a convenient basis for the fisheries, had long been denied even an assembly; but the growth of settlement secured the grant of representative government in 1832, and in 1855 responsibility was conceded there also. The Canadian precedent was of decisive importance for Australia. Settlement in New South Wales had begun in 1788 with the establishment of a penal station. Its earliest form of government was wholly autocratic; not until 1823 was a more normal civil government of the crown colony type introduced. Further advance was hindered by the dread of giving political power to emancipated convicts, whose numbers long exceeded those of free settlers; but the decision to stop transportation to New South Wales in 1840 cleared the way for the concession of representative government in 1842. An energetic demand for responsible government followed, which was strengthened by the enormous increase in the population as a result of the gold discoveries. Representative government was conceded by an act of 1850 to Victoria (separated from New South Wales), Van Diemen's Land, which had become a distinct colony in 1825, and South Australia. Responsible government was promised in 1852 and became effective in New South Wales and the other colonies by 1855-56. It was extended at once to Queensland when separated from New South Wales in 1859. In Western Australia, occupied in 1829, representative government was delayed by the decision of the colonists in 1849 that convict labor was desirable, but the cessation of transportation in 1868 made possible the grant of representation in 1870. Responsibility was withheld until 1890, because of the scanty population, the considerable number of aborigines and the enormous expanse of territory. In New Zealand, which was annexed in 1840,

representative government was from the first contemplated but was delayed until 1852 because of friction with the Maori tribes; it was followed forthwith by agreement to grant responsibility, which became effective in 1856. In the Cape of Good Hope, formally ceded in 1814, crown colony government was rendered advisable by reason of both the numerical preponderance of the Dutch over the British population and the strength of the native tribes. Representative government was, however, granted in 1853 and responsibility in 1872. In Natal, despite the preponderance of the natives, partially representative government was accorded in 1856 and responsible government in 1893, although not without hesitation. A striking faith in responsible government as a solvent of racial animosity was shown by the decision, carried out in 1906-07, to confer it upon the newly conquered Transvaal and Orange River colonies.

At the same time that responsible government was thus being extended widely its scope was steadily expanded to include matters at first retained under imperial control. The colonies were from the first permitted full control of their waste lands; the navigation acts disappeared in the years 1846 to 1849 and full authority to determine tariffs was conceded; the postal and customs services ceased to be imperial in 1851-52. Moreover, in 1862 the imperial government began to apply systematically the principle of asking the colonies to accept responsibility for the preservation of order and of withdrawing imperial garrisons save where, as at Halifax, imperial defense required their retention. This policy fostered the nationalism of the Canadian colonies, which was further stimulated by the spectacle of the emergence of the United States as a great military power and by the necessity of breaking down tariff barriers between the colonies to compensate for the loss of reciprocity with the United States, enjoyed from 1854 to 1866. Hence it became possible to overcome particularism in the colonies and to secure the federation of Canada, Nova Scotia and New Brunswick in 1867. The vast areas under the control of the Hudson's Bay Company were then entrusted to the new dominion, which was joined by British Columbia in 1871 and Prince Edward Island in 1873. The dominion constitution embodied together with the principle of federation the doctrine of responsible government for both the federation and the provinces. The formation of a single government to deal with the imperial government inevitably di-

minished greatly the possibility of imperial intervention, a fact symbolized by the abortive proposal to confer on the federation the style of "Kingdom of Canada."

In Australia federation was delayed by the absence of any foreign danger and by the divergent economic interests of the colonies. A sense of national character and necessity of organization for defense produced the movement which, beginning in 1890, resulted in the creation of the Commonwealth of Australia in 1900. It is significant of the lack of any dominant motive making for unity that the constitution follows much more closely the model of that of the United States and reserves wider powers to the states than does the Canadian constitution. But a sign of the growth of self-dependence is seen in the rule that the commonwealth constitution can be altered by a popular referendum on the initiative of Parliament. The new status of Australia was almost immediately marked by its assertion of complete autonomy in controlling immigration and the determination to create its own naval force.

Union in South Africa followed in 1909. Powerful economic forces hindered agreement among the four colonies on customs duties and railway rates, but the desire was strong to secure independence from that imperial intervention in native policy and intercolonial issues which was inevitable so long as the colonies had no point of unity save in the imperial government. It was hoped also to create an Afrikaner nationality in which British and Boer would merge, and the fullest power to amend the constitution was obtained.

The creation of the federations and the union rendered more and more obsolete the conception of imperial control. This fact was frankly recognized by the Colonial Conference of 1907, which established the imperial conference as a permanent instrument of free consultation between the governments of the United Kingdom and of Canada, the Commonwealth of Australia, the Union of South Africa, New Zealand and Newfoundland, now formally given the style of dominions. So also in 1907 merchant shipping legislation and in 1911 the control of copyright were provided for by agreement in lieu of determination by imperial authority. Even more important was the invitation extended to the dominions in 1912 to take an interest in general issues of foreign policy. Hitherto, while the invariable rule had been to consult a colony on any foreign issue directly affecting it, matters such as

the Hague peace conferences, the Anglo-French Entente of 1904 and the Anglo-Russian Entente of 1907 had remained the concern of the British government alone. Had peace continued, dominion reluctance to take part in foreign affairs might not easily have been overcome; but the World War revealed to the dominions that their fate was being vitally determined by a policy which they had not aided in shaping. Accepting the war as essentially defensive and just, they placed their military and naval forces under British control, receiving in return membership in the Imperial War Cabinet (1917-18), which determined the principles of the conduct of the war. At its close, by reason of the great sacrifices which had enormously strengthened their feeling of nationality, they demanded and received not merely a share in determining the policy of the empire at the peace conference but separate representation on an equality with the minor powers. In the constitution of the League of Nations distinct membership was accorded to all the dominions except Newfoundland, and to India, while the empire as a whole obtained permanent membership on the council. Moreover, not only were the treaties of peace in 1919 signed separately for the king by dominion representatives, but they were not ratified until approval had been accorded by the dominion parliaments as well as that of the United Kingdom.

The new status served a fundamental purpose almost at once in helping to bring the Irish rebellion to a close in 1921. The Irish Free State secured admission to the League in 1923 and sought to assert its autonomy in every possible way. It found enthusiastic support in the Union of South Africa, where General Hertzog had achieved power in 1924 through the support of the Dutch population, many of whom were advocates of secession and sovereign independence. The Imperial Conference of 1926 was thus compelled to deal formally with the issue of dominion status. The practical application of the principle of equality there laid down was worked out by a conference of experts in 1929, and the results of the latter received substantial confirmation and extension at the hands of the Imperial Conference of 1930, which agreed that legal effect to the changes should be given by an imperial act of 1931. It must be remembered that while formally the extension of dominion authority thus effected is considerable, in practice the authority in question has long been enjoyed.

Under this system the dominions in internal matters possess complete autonomy and are exempt from imperial control. Their governors general are chosen by their governments with the king's approval. Their legislation is not subject to imperial disallowance. Appeals from their courts go to the Judicial Committee of the Privy Council only with their assent, and on that tribunal they are represented by their own judges. Their legislatures can alter any imperial act previously applied to the dominions, and no imperial act now applies to a dominion without its assent. When so desired dominion acts may be given extraterritorial application as in the case of British acts. All those who owe allegiance to the king are British subjects, but each dominion can treat all classes of British subjects as it pleases; and within the wider British nationality Canada, the Irish Free State and the Union of South Africa have created nationalities of their own. Commercial policy is absolutely under dominion control, although the several parts of the commonwealth voluntarily refrain from giving preferences to foreign nations as against other parts of the empire. Disputes between governments can be decided only by negotiation or by agreement to refer the issue to an interimperial tribunal, without coercive jurisdiction. The only exceptions to autonomy are the fact that at present the Canadian constitution is still alterable only by the British Parliament, since the provinces have been unable to agree on any system of alteration by Canada alone; and that, while the constitution of the Commonwealth of Australia is alterable by referendum, some sections of the imperial act enacting the constitution are exempt from change save by the imperial Parliament.

In external affairs there are still certain limitations on dominion authority, due to the desire to preserve imperial unity. In matters falling within the sphere of operation of the League of Nations dominion autonomy is complete. Canada in 1927 and the Irish Free State in 1930 were elected as non-permanent members of the League Council in addition to the permanent membership of the empire; delegates to League meetings act under authority conferred by their governments, not by the king and the British government. Except in instances where they have important interests the dominions do not set up legations of their own in foreign countries nor receive envoys from them but make use of the British diplomatic service. Even where with the aid of the British government exchange of

diplomatic representatives has been arranged, the formal authority to sign treaties and the ratification thereof require the intervention of the British foreign secretary. This is in accordance with the rule, accepted by the British as well as the dominion governments, that no part of the empire should enter into negotiations with a foreign power without giving the other parts of the empire the opportunity to join in the negotiations or to suggest objections. In the event of disagreement of a substantial character as to policy the issue would presumably be dealt with by the Imperial Conference and a compromise reached. Imperial unity is also attested by the fact that no governor general has yet been given authority to make war or peace or declare neutrality; and apparently a declaration of war by the king on the advice of the imperial government would bind the dominions, although it would remain with them to decide to what extent they would actively intervene. It is hoped, however, that as a result of the Locarno pact of 1925 and the Kellogg pact of 1928 as well as the League Covenant the issue of neutrality may never arise. It has so far been evaded by the Imperial Conference.

Although the Imperial Conference of 1926 seemed to contemplate dominion status as a final form of the organization of the commonwealth, this view is open to question. In the Irish Free State and the Union there is a tendency to seek the further assertion of equality by securing formal admission of the right of secession and the elimination of any British cooperation in the formal machinery of treaty making. This would reduce the commonwealth to a purely personal union, the relations between the parts being placed on the basis of international law, a doctrine hitherto repudiated by the British government. Australia and New Zealand, conscious of danger in the Pacific, prefer to maintain closer imperial unity; and Canadian feeling is influenced by the objections of the French Canadians to any tampering with the constitution of 1867, which is regarded as the best security for their religious and linguistic privileges. Real interest at present is centered mainly not on constitutional issues but on the possibility of creating an economic scheme of closer union by inter-imperial preferences and other trade agreements.

Dominion status demands a certain power to stand alone. Hence Newfoundland, although technically a dominion, does not possess dominion status in external affairs; and both Malta and Southern Rhodesia, which enjoy a con-

siderable measure of responsibility in internal matters, are too weak to be advanced to dominion rank. The new constitution of 1930-31 destined for Ceylon reserves external relations to the British government. India, on the other hand, has been assured of full dominion status as the ultimate object of her constitutional reforms. As the Round Table Conference of 1930-31 showed, internal autonomy can be achieved by the creation of machinery in the new constitution under which the rights of minorities shall be preserved by judicial safeguards. Full control over defense and foreign affairs must be of slower development, because for a considerable time to come defense would be impossible without the aid of British troops and of British officers serving with Indian troops. So long as this is the case, imperial control cannot wholly be relaxed. Moreover, the Indian states have treaty rights against the crown and cannot without their assent be made subject to the control of a responsible government in India. This difficulty, however, will be removed by the acceptance by these states of federation with British India, which the conference showed to be practicable as well as desirable. Such a federation would add greatly to the sense of Indian nationality and hasten the attainment of full dominion rank, which may successfully counter the movement for complete independence in India.

To no other part of the empire is dominion status likely to become appropriate. It was once suggested that Egypt and Irak might be offered this position, but the idea was impracticable, not merely because dominion status is based on a common allegiance but because it contemplates a measure of intimacy in framing policy between the dominions and the United Kingdom which could not easily be made applicable to either of these states. In Palestine rivalry of Jew and Arab makes even effective internal autonomy problematical, and external relations under the mandate remain in the hands of the mandatory power.

It may be doubted if the conception of dominion status can be applied outside the British Commonwealth. Its essential basis, autonomy and consultation, assumes the existence of units with distinctive national feelings; and the system is thus wholly out of harmony with the governing principle of French colonial policy, the subservience of the empire to the protection of France and the diffusion of French cultural ideals and national feeling. Similarly in the rela-

tions between the United States and the Philippines there is wholly absent that measure of potential equality which renders consultation the appropriate method for the conduct of the relations between the United Kingdom and the dominions.

DONEAU, HUGUES (Donellus) (1527-91), French jurist. He studied law at Toulouse and later at Bourges, the main center of humanistic legal studies in the sixteenth century, where he was the pupil of Douaren. Doneau himself became professor at Bourges in 1551, teaching there until 1572, when after the Massacre of St. Bartholomew he was obliged, being a Calvinist, to seek refuge at Geneva. In 1573 he became professor at Heidelberg, in 1579 at Leyden and in 1588 at Altdorf in Germany, where he taught until his death in 1591.

Doneau was second only to Cujas among the illustrious sixteenth century French civilians. They were representative of the reaction of Renaissance humanism against the aims and methods of the Bartolists, or commentators. The *mos italicus* of the Bartolists, which was fundamentally an analytical-exegetical method with a fixed and complicated mechanism, gave expression to mediaeval scholasticism and mediaeval belief in tradition and authority. In opposition to the *mos italicus* the sixteenth century civilians in France evolved a method known as the *mos gallicus*. This new method represented, nevertheless, two distinct tendencies in the study and teaching of the pure Roman law on humanistic lines. Guillaume Budé and Andrea Alciati had applied to the texts of Roman law an exegesis based on philology and history; and this method found its leading exponent in Cujas, the most illustrious of all French civilians

in the epoch of the Renaissance. The second tendency in humanistic legal study, also included in the term *mos gallicus*, was fundamentally a method of synthesis as opposed to exegesis. It was applied to the Roman legal sources by Connanus (1508-51) and Douaren but it remained to be elaborated and in a sense perfected by Doneau.

Restricting his attention to the Roman private law Doneau sought throughout his entire career as teacher and writer to know and to expound that system in its entirety. Practically all his earlier writings were studies preparatory to his greatest work, the celebrated *Commentarii juris civilis*, composed of twenty-eight books. Much of this treatise, epoch making in the history of modern efforts to systematize the Roman law, had been completed by Doneau at Altdorf shortly before his death; the rest of it was put together by Scipio Gentili (1563-1616), Doneau's pupil and friend, out of the great jurist's own papers.

Doneau's systematization of the subject matter of Roman private law was influenced by the arrangement which he found in the Institutes, but in important particulars he departed from his model and introduced his own conceptions as to the order and treatment of topics. The legal system, according to Doneau, consists of two parts: the first part deals with rights (*cognitio juris*), while the second is concerned with their enforcement by judicial process (*ratio juris obtinendi*). It is divided accordingly into substantive and adjective law. While the division of law in the Institutes of Gaius and of Justinian is threefold (*omne jus quod utimur vel ad personas pertinet vel ad res vel ad actiones*), in keeping with the trichotomy of many Roman jurists, the division of Doneau, based on dichotomy, is fundamentally twofold (*cognitio juris nostri et ejus juris obtinendi ratio*). Moreover, while in general the Institutes constitute a system of legal rules Doneau's *Commentarii juris civilis* emphasize the subjective aspect of the law and form in fact a system of rights as distinguished from the rules on which they are based.

Holding that for the needs of his time the most important task of legal science was the exposition of the entire body of Roman private law and of the inner relationship of all its parts one to another, Doneau by means of synthesis first extracted from the Roman sources the general principles of law and then proceeded to deduce from them logically and rigorously all their consequences. Calisse has said that the Bartolists

in France were led by Doneau, while Tardif has considered him as "le plus éminent représentant de l'école dogmatique ou Bartoliste"; but as Esmein has pointed out, although Doneau was dogmatic like all scholars who synthesize, his method was far removed from that of the Bartolists. In the sixteenth century Doneau was in fact the foremost representative of those humanist civilians who applied the synthetic and dogmatic method, as opposed both to the analytical-exegetical method of the Bartolists and the philological-historical method of exegesis followed by Budé, Alciati and Cujas. Working within this field of Roman law Douaren and Doneau developed their own method of natural synthesis without being influenced by the similar process associated with the name of Pierre de la Ramée (Petrus Ramus, 1515-72).

Brissaud has classed Cujas and Doneau together as representative of the historical science of Roman law. But in fact they exemplified the two opposing tendencies of the *mos gallicus*. Cujas was fundamentally the historian, Doneau the theorist. Cujas was the great exegete, Doneau the great synthesist. Cujas was interested in the particular, Doneau in the general. Cujas looked at the texts as material to be used in a philological and analytical interpretation of all its individual parts; Doneau, on the other hand, regarded the details which he found in the texts only as materials from which a system of the whole law from the standpoint of rights could be constructed. Cujas viewed the Roman law books, like all other gifts from antiquity, as data for learned antiquarian investigation; Doneau, on the contrary, treated them as the embodiment of a living law that had validity in his own day. Since Cujas disregarded the Roman civil law of mediaeval times, concentrating his whole attention upon the pure Roman law as found in the law books of Justinian and earlier sources, his influence was largely in the realm of scholarship and education. But although Doneau too was concerned chiefly with the pure Roman law he was willing to make use of the adapted Roman law of mediaeval times, and his influence was thus felt also in practise.

The sixteenth century school of French civilians quickened and intensified the general progress of legal humanism particularly in Holland and Germany, which already had a contemporary leader in Ulrich Zasius, the chief representative of the exegetical method in the latter country. Apart from humanism there existed in Germany a craving for knowledge of

the Roman law as a system, for its rational treatment and synthetic exposition. German students at Bourges were fascinated by the lectures of Douaren and Doneau, and some of Doneau's pupils, notably Valentin Forster, carried the master's methods to Germany. Moreover, not only Doneau but also Baudouin, Hotman, Denis Godefroy and other leading French jurists, driven from their own country by the various religious conflicts of the sixteenth century, found homes in Germany and there, both as teachers and as writers, exerted a notable influence on the development of German legal science.

Largely because of the ever increasing attention that also came to be paid to the sources of French customary law in the sixteenth century by a great school of national jurists which included such names as Dumoulin, d'Argentré, Coquille and Loisel, the study of Roman law in France decreased in significance in the following centuries. In France Doneau's writings, and particularly his *Commentarii juris civilis*, helped to prepare the way for the shaping of the *Code civil*, which was founded on Romanic materials as well as French customary sources. As the primacy in Roman legal scholarship had passed in the sixteenth century from Italy to France, so in the eighteenth century it passed from France to Holland, while in the nineteenth century it passed from Holland to Germany. Despite these changes in leadership, however, the influence of the French sixteenth century school persisted and left its mark on the scholarship of later centuries in all countries where the Roman law was studied. The work of Doneau in particular was felt throughout Europe and proved to be one of the main factors in the long process of systematizing the Roman civil law both as the law of ancient times and the law of modern states.

DONNELLY, IGNATIUS (1831-1901), American political reformer and agitator. He was born in Philadelphia of middle class immigrant parents, practised law for a short time and then went to Minnesota to speculate in land. The panic of 1857 ruined his town development project and he turned to farming. Having shifted from the Democratic to the Republican party on the slavery issue, he was elected lieutenant governor in 1859 and served as congressman from 1863 to 1869. He lost favor with the Republican leaders in Minnesota and was not renominated in 1868. Thereafter he drifted from one opposition camp to another and served several terms in the Minnesota legislature. He was a Liberal Republican in 1872, was active in the Granger movement and the Anti-monopoly party, published the *Anti-monopolist* (1874-78), joined the Greenbackers, became state president of the Farmers' Alliance in 1890 and rose to national leadership in the Populist party. He wrote most of the party platforms, published a Populist paper, the *Representative* (1894-1901), and supported Bryan on free silver in 1896 but thereafter opposed fusion with the Democrats. Donnelly wrote several pseudo-scientific books and also works of fiction dealing largely with social and economic problems. He opposed the protective tariff and hard money and called for reforms to prevent the concentration of wealth and the loss of freedom to the mass of Americans.

DONOSO CORTÉS, JUAN, MARQUÉS DE VALDEGAMAS (1809-53), Spanish political theorist and diplomat. Donoso Cortés studied at the universities of Salamanca and Seville and in 1832 attracted public attention by the *Memoria* which he addressed to King Ferdinand VII on the condition of the Spanish monarchy and in which he urged the abolition of the Salic law and an alliance between the monarchy and the progressive middle class. He soon achieved prominence in political circles, became secretary to Queen Maria Christina and later was put in charge of the studies of Queen Isabella II. He lectured on public law at the Ateneo in Madrid and was ambassador at Berlin and Paris.

Donoso's theories may be divided into two phases. In the first he followed the French doc-

trinaires in their attempt to reconcile rationalist principles with historical tradition and popular sovereignty with the divine right of kings. His chief emphasis during this period, however, was on "the sovereignty of the intelligence." Whenever he used the word intelligence he used it as synonymous with justice. About 1848 there was a marked change in his thinking. He experienced a reaction against rationalism and began to exalt the function of authority, government and finally of dictatorship. His elaborated theory of the dictatorship was so profound that his discourses were reproduced in France, Prussia and Austria. "When legality is enough, use legality; where it is not, use dictatorship," he said, and added that legality must be sacrificed whenever the welfare of society demanded it. At that time he already held that every revolution in the future would necessarily be a social revolution because it would obey acquisitive instincts rather than ideals.

Donoso may be considered the most eminent thinker of the Spanish ultramontane school. In his significant *Ensayo sobre el catolicismo, el liberalismo y el socialismo* (Madrid 1851; tr. by M. V. Dahlgren, New York 1925) he reverted to the church as the foundation of authority and as the only organization capable of insuring social and political salvation. The essay aroused considerable controversy. Not only was the fame of his works spread by Montalembert and the French school, but they found an echo in Metternich and were discussed by Schelling, Ranke, Bismarck and Frederick William IV of Prussia.

Consult: Schmitt, Carl, *Donoso Cortés* (Madrid 1930); Pascal, Georges de, "Donoso Cortés, un maître de la politique" in *Revue critique des idées et des livres*, vol. xix (1912) 5-22, 310-23; Costa, J., *Estudios jurídicos y políticos* (Madrid 1884) p. 123-29.

DORADO MONTERO, PEDRO (Pedro García Dorado y Montero) (1861-1919), Spanish jurist and penologist. After receiving the degree of doctor of laws at the completion of his legal studies in Spain Dorado attended the Spanish college of San Clemente in Bologna, Italy, where he studied sociology and the philosophy of law under Roberto Ardigó and Pietro Siciliani. His major interest during this period, however, was in the development of the positivist school of

penology, which at the time was attracting very wide attention. He was concerned particularly with the problem of how to reconcile this positivist spirit with the theory of correctionalism held by Francis Giner de los Ríos, the Spanish penologist by whom he had been so profoundly influenced during his earlier studies. In the years following his appointment to the chair of criminal law at the University of Salamanca, Dorado in addition to distinguishing himself as an original and profound teacher continued his intensive studies, finally reconciling the positivist and correctionalist positions. The conclusion at which he arrived, namely, that the function of criminal law is to protect the offender, is epitomized in the title of one of his last works, *El derecho protector de los criminales* (2 vols., Madrid 1916), which was an enlarged and revised edition of his *Estudios de derecho penal preventivo* (Madrid 1901). In the philosophy of law he was influential by reason of his profound and realistic consideration of law as the will of the strongest. Although indifferent during his earlier years to law and authority and therefore inclined to anarchism he came eventually to view the state as an organism essential to social progress—a view elaborated in his posthumous work *Naturaleza y función del derecho* (Madrid 1927). Dorado's work as penologist, jurist and sociologist was affected by his extreme pessimism and his sharp, perhaps overdeveloped, critical sense, which made him intolerant of all dogma.

DORCHESTER, BARON. *See* CARLETON, GUY.

DORMER, DIEGO JOSÉ (d. 1705), Spanish economist and historian. Dormer held several ecclesiastical and state offices and was the official historian of the kingdom of Aragon.

In his *Discursos históricos-políticos* (Saragossa 1684), a memorial to the Cortes of Aragon, he presented economic doctrines surprisingly in advance of his time. He virtually advocated international free trade in its modern connotation, demonstrating clearly that international trade is an exchange of goods, that restriction of imports is equally a limitation of exports and that the protection of inefficient industries is inimical to public welfare. He illustrated the shifting of import duties to the consumer and showed that an increase in tariff rates often results in decreased receipts. Although he ridiculed the idea that the introduction of foreign goods results in withdrawal of specie Dormer was not rigid in his analysis of international payments. He lamented the withdrawal of gold by the Moors and favored prohibiting the residence of foreign merchants in Spain since they took their accumulated money out of the country when they left. While he attributed Aragon's economic decline to excessive taxation and idleness, his purpose in advancing remedies for both evils was the increase in population.

The most important source of the state revenue was the customs duties. Dormer proposed that they be abolished and that a sum equivalent to these taxes be raised by the municipalities. While his proposal left to the option of the latter the method of raising their quotas, he indicated his preference for sales taxes. Despite the attacks of many of his contemporaries and a general lack of support Dormer's proposals influenced the Cortes of 1686 in reducing the customs duties of Aragon.

As a historian Dormer combined a critical use of the works of others with independent research. Using original sources he continued the historical research of Jerónimo Zurita, the first official historian of Aragon, and brought to light valuable material from the rich archives of that region.

ROBERT S. SMITH

Consult: Bona, Raymond, *Essai sur le problème mercantiliste en Espagne au XVII^e siècle* (Bordeaux 1911) p. 184-93; Colmeiro, M., *Historia de la economía política en España*, 2 vols. (Madrid 1863) vol. ii, p. 339-40.

DÖRPFELD, FRIEDRICH WILHELM (1824-93), German educator. Dörpfeld attended the teachers' seminary at Mörs and was after-

wards a schoolmaster in various villages. In 1849 he became head master of the subsequently famous Wupperfelder Kirchschule at Barmen, where he taught for thirty years. He founded and was active in many teachers' societies and beginning in 1857 edited the widely read *Evangelisches Schulblatt*. His numerous works on the philosophical, psychological and practical aspects of education have been collected under the title of *Gesammelte Schriften* (12 vols., Gütersloh 1894-1901).

Dörpfeld was particularly interested in the elementary school curriculum. Its purpose was, he felt, to give pupils an understanding of the unity of the universe and to lay a solid foundation for character development by emphasizing the ethical point of view. The curriculum should be a living, well regulated organism providing for the study of all branches of knowledge, so correlated as to make their interrelationships evident and to improve the pupil's comprehension of each particular field. Sociology must be included, primarily as an aid to the pupil in his understanding of history and contemporary social life. Discipline should be educative and military ideas of discipline eliminated. Dörpfeld's ideas on school systems were discussed in several of his works, including *Ein Beitrag zur Leidesgeschichte der Volksschule* (Barmen 1881, 2nd ed. 1882), an answer to the reactionary Prussian minister Puttkamer, who wished to make the schools the instruments of the state and had bitterly attacked the teaching profession in a speech in the Landtag in 1880. The best school system, Dörpfeld believed, was one of self-governing school communities controlled neither by the church nor by the state but representing their interests as well as those of the community, the teachers and above all the family. There must be no restrictions upon freedom of conscience in teaching.

Dörpfeld is a significant figure in the development of the Herbartian system, which he applied to the theory and practise of elementary school pedagogy. He went beyond Herbart, however, in his emphasis upon the social point of view in education. For many years he campaigned actively for his proposed school system and enjoyed a wide influence in educational circles, especially in Prussia. His most valuable contribution to educational psychology is his *Denken und Gedächtnis* (3rd ed. Gütersloh 1886, 12th ed. 1911; first published with title *Zur pädagogischen Psychologie*, 1866), in which he stressed understanding rather than memory as

the basis of learning and pointed out that understanding greatly increased the power of memory.

DOSTOEVSKY, FIODOR MIKHAILOVICH (1821-81), Russian novelist and publicist. Dostoevsky was the son of a doctor attached to a hospital for the poor in Moscow. He suffered all his life from poverty and epilepsy. In 1849, already noted as an author, he was arrested in St. Petersburg for a minor political offense and condemned to death. He was reprieved and exiled to Siberia, where he spent ten years as a convict and a soldier. On returning to St. Petersburg he resumed his pen and devoted the rest of his life to his major novels: *Crime and Punishment* (1866), *The Idiot* (1868), *The Possessed* (1871-72), *Raw Youth* (1875), the *Brothers Karamazov* (1879-80). His prison reminiscences, *The House of the Dead* (1862), form an important social document. He was also a magazine editor and in his last years published *An Author's Diary*, a one-man journal of opinion.

Dostoevsky was an intellectual proletarian. His earliest work, *Poor Folk* (1846), with its Dickensian pathos was acclaimed as the first attempt at a social novel in Russia, yet his other early writings show a concern for the weak and downtrodden rather as sufferers from inner maladjustment than as victims of an iniquitous system. His mature work is a vast contribution to our knowledge of the psyche but it also bristles with problems of the moral order. Among these recurs constantly the question of how the claims of the individual may be reconciled with those of society. Whether explicitly or implicitly his novels assert the worth, dignity and freedom of the personality as well as the danger it runs when it is a law unto itself. This violent inquisitor of wilful, warring souls looked for salvation to a churchlike brotherhood of men, each denying his ego not out of self-interest but in a spirit of Christian humility and love. He felt that it was Russia's mission thus to solve the social problem and unite the peoples of the earth in the name of Christ. This "Russian socialism" he opposed to the ignoble capitalism and the mechanical socialism of the West, which

he abominated equally as inimical to spiritual values.

AVRAHIM YARMOLINSKY

Works: Dostoevsky's works have been collected in 21 vols. (St. Petersburg 1911); 2 supplementary volumes of newly discovered material were edited by L. P. Grossmann (Petrograd 1918). English translations: *Novels* by Constance Garnett, 12 vols. (New York 1913-23), and *Pages from the Journal of an Author*, a brief selection of Dostoevsky's publicist writings tr. by S. S. Kotliansky and J. M. Murry (Boston 1916). *Consult:* Noetzel, Karl, *Das Leben Dostojewskis* (Leipsic 1925); Yarmolinsky, Avrahm, *Dostoievsky: a Study in His Ideology* (New York 1921); Berdyayev, N. A., *Mirosozertsanie Dostoievskago* (Prague 1923), translated into German as *Die Weltanschauung Dostojewskis* (Munich 1925); Prochovov, G., "Das soziale Problem bei Dostojewski" in *Zeitschrift für slavische Philologie*, vol. vi (1930) 375-410.

DOUAI, ADOLF (1819-88), American socialist. Douai was born in Altenburg, Germany, the son of a teacher. He studied philosophy and theology in Germany, received his doctor's degree at Dorpat, Russia, and then conducted a school in Altenburg. He participated in the Revolution of 1848, served a year in prison for violating the press laws and then emigrated to Texas. He established the *San Antonio Zeitung*, in which he expressed abolitionist views. Forced to leave Texas, he next taught school in Boston and then in Hoboken and he finally settled in New York.

From 1868 to 1870 he edited the *Arbeiter Union*, official organ of the German speaking radical and trade union movement. On the establishment of the Working Men's party in 1876 (Socialist Labor party, 1877) he became an editor of its three publications, *Labor Standard*, *Arbeiterstimme* and *Vorbote*. From 1878 to 1888 he was editor of the *New Yorker Volkszeitung*.

A middle class radical, Douai at first opposed communism. He was a member of the National Labor Union and later supported the currency reform program of the Greenback movement. He attended the Greenback convention at Chicago in 1880 as one of the Socialist Labor delegates. He was repeatedly attacked by the German General Workingmen's Union of New York, parent body of the North American Federation of the International. His leftward drift probably began in Hoboken, where F. A. Sorge was a member of his teaching staff, and when *Das Kapital* appeared in 1867 he became an ardent Marxist. Douai was among the first to popularize Marx' doctrines in America. In Socialist Labor intraparty fights he endeavored

to moderate between the trade union and political factions.

While in Boston Douai conducted one of the first Froebel kindergartens in America. As director of the Hoboken Free Academy, a German secondary school, he attempted to introduce radical notions and was forced to resign in 1866 because of his atheistic views. In a pamphlet on kindergartens and public schools he advocated free education for all, including proper subventions to enable the poorest parents to give their children complete educational opportunities, and the freeing of schools not only from church but also from political influences.

SELIG PERLMAN

Works: *Better Times* (Chicago 1877, 2nd ed. New York 1884); *Kindergarten und Volksschule als sozial-demokratische Anstalten* (Leipsic 1876); *ABC des Wissens für die Denkenden* (Leipsic 1875); *Antwort an den Bekenner des Theismus* (Leipsic 1875); *Land und Leute in der Union* (Berlin 1864); *Heinzen, wie er ist* (New York 1869).

DOUAREN, FRANÇOIS LE (also Duaren; in Latin Duarenus) (1509-59), French jurist. He taught at Bourges, holding the professorship there twice with an interval of practise at the bar of Paris. He was first associated with Éguinaire Baron but later came into conflict with him as well as with Baudouin. Douaren was the most brilliant representative of the historical school prior to Cujas and was perhaps the latter's equal. He differed in his method from Cujas only by a more pronounced tendency toward rational, synthetic exposition and literary preoccupation. He gave a comprehensive course on the Pandects from 1535 to 1538 in which he attacked the Bartolists, who responded in kind. His *De ratione docendi, discendique juris* (1544), addressed in the form of a letter to André Guillard, is really the manifest of the historical school. Douaren showed the possible utilization of inscriptions in a rational exposition of the Roman law and illuminated many sections of the Digest, particularly *Regulae juris*. His *In tractatus de pactis* (1545) is a good example of his systematic method. In the first book of his *Libri disputationum anniversariarum* (1547-53) he anticipated the *Observationes* of Cujas. He collaborated with Louis Roussard in an unglossed edition of

the *Corpus juris civilis* (1561), in which his treatment of the Novels is especially important. It is this edition also which contains Douaren's remarkable *Summaria ad pandectas*. His celebrated polemical work *De sacris ecclesiae ministeriis ac beneficiis* (1551), marked by a spirit of religious liberty, should also be mentioned.

J. DECLAREUIL

Works: The best edition of Douaren's works is the *Opera omnia*, 4 vols. (Lucques 1765-68).

DOUBLE JEOPARDY. The double jeopardy clause of the Fifth Amendment to the American constitution—"nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb"—reveals in the quaintness of its phraseology the antiquity of its common law origin. Similar prohibitions, although sometimes in modified form, are found in the constitutions of most of the American states; but whether found there or not the guaranty against double jeopardy under pleas of *autrefois acquit* or *autrefois convict* has been held by the federal Supreme Court to be included within the general due process prohibition of the Fourteenth Amendment [*Shoener v. Pennsylvania*, 207 U. S. 188 (1907)]. Embodied therefore in both state and federal bills of rights, this guaranty has been interpreted and applied in a large number of judicial decisions in both jurisdictions, not always with harmonious results.

Needless to say, the limbs of persons accused of crime are no longer put in jeopardy even once by civilized governments, and the reference to life has not been construed to limit the protection to offenses for which capital punishment may be inflicted. On the contrary, it applies to all offenses in the category of felonies and in most states even to indictable misdemeanors.

The most difficult question for interpretation by the court is the determination of the point in any criminal proceeding at which a first jeopardy can be said to have begun. Generally speaking, the rule in both the federal and most of the state courts is that where a trial has proceeded to a verdict of conviction or of acquittal, the accused has certainly been placed once in jeopardy. He cannot thereafter be retried at the

instance of the prosecution whether or not errors in his favor were allowed in the course of his trial. This rule is carried so far that a statute of Congress was held void which allowed an appeal by the government but expressly provided that upon such appeal "a verdict in favor of the defendant shall not be set aside." This, however, was based upon the ground that judgment upon an appeal of this kind would be merely an expression of opinion and therefore not a judicial act [*United States v. Evans*, 213 U. S. 297 (1909)]. But in *Kepner v. United States* [195 U. S. 100, 134 (1904)] Mr. Justice Holmes, with two other justices concurring, could be heard arguing eloquently against this general rule in favor of something more nearly approximating the doctrine of the civil law of the continent of Europe. It seemed to him that "logically and rationally a man cannot be said to be more than once in jeopardy in the same cause, however often he may be tried. The jeopardy is one continuing jeopardy from its beginning to the end of the cause. Everybody agrees that the principle in its origin was a rule forbidding a trial in a new and independent case where a man had already been tried once. But there is no rule that a man may not be tried twice in the same case." The same point is made in *State v. Lee* [65 Conn. 265 (1894)]: "The principle of finality is essential; but not more essential than the principle of justice. . . . The adjustment of these principles . . . is determined in each jurisdiction by considerations of public policy and not by fundamental principles of jurisprudence."

Such a view of the situation has not prevailed in the United States. Indeed, many of the states have stretched the protection against double jeopardy to the point of declaring that where the accused has been convicted of a lesser crime included in a greater offense for which he was indicted and where he himself procures a reversal of the judgment on appeal, he may not in the new trial be convicted of an offense greater than that of his previous erroneous conviction. But this doctrine is rejected by many states and also by the federal courts [*Trono v. United States*, 199 U. S. 521 (1905)]. In view of the long prevailing practise in America of reversing judgments of conviction upon hairsplitting technicalities and in view of the numerous instances of honest doubt concerning the laws of evidence, it would be a mockery of justice from the viewpoint of social protection if every judgment reversed at his own

instance operated to acquit the accused. There are those, however, who urge even this extreme.

While the protection against double jeopardy is probably most important as applied in cases that have been actually prosecuted to the point of a verdict and judgment in the trial court, the principle is not confined to such cases. In most jurisdictions a person is regarded as having been put in jeopardy by proceedings short of an actual verdict and judgment; but mere preliminary proceedings are not sufficient. Thus discharge by a committing magistrate or the refusal of a grand jury to indict or a *nolle prosequi* entered prior to the impaneling of a jury or the quashing of a defective indictment or the entering of a judgment for the defendant on his own demurrer is no bar to a subsequent valid indictment and prosecution. In fact, even though a person has been tried under an indictment so defective in its averments that any judgment upon it will be reversible for error, the accused may be reindicted and tried again. The general rule is: "One is in jeopardy when put upon trial before a court of competent jurisdiction, upon an indictment sufficient to sustain a conviction, and a jury has been impanelled and sworn to try him." Thereafter any unreasonable discharge of the jury is tantamount to acquittal. But this seldom happens. A jury may be discharged without giving rise to double jeopardy in case of the illness of the judge or a juror or the prisoner or the prosecuting attorney or the misconduct of a juror or jury tampering, and especially and more usually in the case of inability to agree. With respect of discharge upon disagreement large discretion must of necessity rest with the judge.

Many of the cases involving double jeopardy turn on technical points which are of primary interest only to criminal lawyers. It should be pointed out here, however, that in their results some American civil actions closely approximate criminal prosecutions; for example, proceedings for an injunction that operates to close for a definite period a place in which liquor has been sold or a theater in which an indecent play has been produced. Such civil actions may be had in addition to criminal prosecutions without colliding with the prohibition against double jeopardy. Another point to be noted is that penal laws frequently list as offenses a series of acts that may constitute essentially only one transaction. Double jeopardy, for example, is not involved when a person is prosecuted for each of the acts of possessing, exhibit-

ing and selling obscene pictures, although it is difficult to see how he could exhibit or sell without possessing.

It is well settled law in the United States that a single act may be an offense against more than one of the units of government and that a separate prosecution by each of the offended units does not constitute double jeopardy. Thus an act may be made subject to punishment by both national and state laws and possibly also by municipal ordinance. Although this rule was long ago laid down, prohibition laws constitute the stock example of its application since the advent of the Eighteenth Amendment and the enactment of the National Prohibition Act. When asked to overturn the established rule as applied to prohibition laws the Supreme Court replied: "An act denounced as a crime by both national and state sovereignties is an offense against the peace and dignity of both and may be punished by each. The Fifth Amendment, like all other guaranties in the first eight amendments, applies only to proceedings by the federal government . . . and the double jeopardy therein forbidden is a second prosecution under authority of the Federal Government after a first trial for the same offense under the same authority" [United States v. Lanza, 260 U. S. 377 (1922)]. Probably no clearer instance of double jeopardy, in fact, could be found than that in which a person is prosecuted by two different governments for one and the same act. The courts have not attempted to deny that. They have gone no further than to say that the constitutional guaranty against double jeopardy does not operate to prevent such double prosecutions. This, however, squares more nicely with the principles of American federalism than with the principles of justice. Of course, either unit of government may of its own volition outlaw such possibilities, but it is under no constitutional obligation to do so.

While the independence which state and national governments in the United States enjoy within their respective spheres gives considerable justification for the rule of law just mentioned, there appears to be far less reason for the rule that a prosecution for violation of a municipal ordinance is no bar to a prosecution on the same set of facts under a state law covering the same offense. Such, however, is the general rule, supported as it is by one or another legal fiction concerning the nature of a municipal ordinance. Needless to say such double

prosecutions are in fact rare. Otherwise the rule would probably long since have been modified or abolished.

DOUBLE TAXATION.

INTERNATIONAL. Double or multiple taxation may be broadly defined as the levy of more than one tax upon the same tax base by one or more tax authorities; in its important aspects double taxation is at present limited, however, to cases in which more than one tax jurisdiction is involved. The modern problem of double taxation arises in a complex and industrialized world, because men can own sources of wealth or profit at a distance and also because profit is the combined result of a number of operations in different places. When these places are in different countries or tax jurisdictions, double taxation may arise. A, living in New York, owns shares in a mine in Mexico or B, living in London, owns a ranch in Argentina. If taxes are applied only to the sources of wealth at their situs then the Mexican and Argentinian governments will raise revenue from these sources, and if it is heavy taxation the income remitted to New York or London will be *pro tanto* reduced. But the American and British governments find that A and B respectively enjoy many rights and privileges within their jurisdiction; these residents are regarded as suitable subjects for taxation not to be foregone merely because they have no income arising in New York or London. The world today pays more and more regard to the whole ability of the individual to bear taxation where he resides,

and taxation becomes increasingly subjective. But at the same time objective taxation, where the sources of wealth are situated, has not been given up; and so whenever source and owner are apart double taxation may arise.

When taxation is imposed after an investment of this kind has been made, the anticipated yield is reduced and the owner cannot sell the investment to another person in his own jurisdiction without suffering the capitalized effect of the burden in the price he gets; although he may perhaps sell to a resident in the country of origin, who will not be subject to the disability of duplicate taxation, at a price not so reduced. But new investment will not take place in face of an established system involving the two taxes unless it yields as much to the investor as an investment subject to equivalent risk elsewhere. In that way the country imposing the tax at the site of the investment (the country of origin) really bears its own tax by having to pay a higher rate than would otherwise be necessary for foreign capital. When a state like Poland borrows on the London market it has always to contract to pay its bond interest free of Polish taxes, the London or New York recipient getting thus a net yield avowedly comparable with the yield from investments of similar risk in his own country. But when the money is invested in a business or in land, the government of Poland has no wish to get less taxes from that business or land than it would were it owned by a Polish resident; indeed the instinct is that the foreigner should pay even more. Double taxation therefore acts like a tariff to keep capital from flowing freely over international boundaries and to make it more natural for capital to remain within national borders.

The problem of double taxation was the object of international agreements on a minor scale in the nineteenth century, but neither these nor the special arrangements between Great Britain and her dominions offered any satisfactory solution. The acute situation created by the multiplication of the financial burdens of the World War brought the question to the forefront of discussion. The problem was considered especially by a Committee of Economic Experts appointed by the League of Nations in 1922 after preliminary discussion by the International Chamber of Commerce.

Although the most acute problems arise in connection with the income tax, the committee also considered problems involved in other kinds of taxes and advised that all corporeal wealth,

including realty and tangible personal property, with the exception of money, jewelry and the like, ought to be assigned predominantly or wholly to the place of origin or situs; all intangible wealth, except real estate mortgages, ought to be assigned predominantly or wholly to domicile or residence.

With regard to the income tax the committee concluded that as between the rival claims of the principles of residence and origin residence should prevail and that the best available basis of relief was "the reciprocal exemption of the non-resident." In other words, Poland should give up the tax on income arising within her borders and going to New York or London and the United States or Great Britain should give up the tax on income arising within their jurisdictions and going to residents in Poland. All subsequent discussions by experts have proceeded on this principle, but the practical difficulties in giving effect to it are very great. In the first place, it is a hard doctrine to countries which on balance are debtors, because their fiscs must give up more than their residents gain. Moreover, such countries are generally those in the less advanced stages of development, where income taxes do not often carry the predominant idea of progression based on the total income of the resident but are rudimentary, fully imbued with the principle of origin and assimilated to taxes *in rem*.

Again, the problem of origin in itself is not simple, because of the widely separated activities which only in combination can yield an economic profit at the point of sale. The idea of economic allegiance covers a wide field of possible interest—the situs, the place of control and management, the place in which enforceability of rights may rest and the place where a profit is finally made as well as the place of different stages of distribution and spending. Some of the economic issues involved are not strictly determinate.

Definite general progress in establishing bilateral double tax agreements is slow, but meetings of technical experts have elaborated standard forms of convention suited to different fiscal conditions, which are available for countries whose budgets will permit of the step. These arrangements allow of many variations from the simple principle of the exemption of the non-resident, in deference to established views in debtor states. Some of these variations embody the alternatives suggested by the Committee of Economic Experts as substitutes for

the method of reciprocal exemption. These alternatives are: the method of deduction, permitting residents to deduct from their taxes the amount paid in the other country on the same item of wealth; the method of division, allocating taxes between the country of domicile and the country of situs in certain agreed proportions; and the method of classification, according to which the items of wealth are treated separately, some being assigned to the country of situs and some to the country of domicile. It appears that the main lines of settlement are now well laid down in principle and disputed only in details.

J. C. STAMP

DOMESTIC. Double taxation by competing jurisdictions is of even greater importance in federal than in international finance because of the closer economic relations between the states of a federal union. The attempt to obviate double taxation in such cases has assumed several forms. Sometimes, where the matter has been relegated to the independent action of the separate states, reliance has been placed on the growth of the sentiment of interstate comity. In other cases the central government has intervened either through positive legislation or through the action of the federal judiciary.

The chief example of independent action by the separate members of a larger union is found in the British Empire. As a result of the high income taxes during the World War, cases of double taxation became so numerous and so grievous as to lead to remedial legislation in 1920. This provides that when both the mother country and the dominion tax the same income, Great Britain shall remit to its taxpayers the amount of the dominion tax up to one half of the British tax. Most of the dominions adopted similar provisions for double taxation by dominions. In the case of death duties Great Britain has thus far acted in only one case, making the succession duty payable in any Canadian province deductible in full from the British estate duty; and some of the Canadian provinces, like Ontario, British Columbia and New Brunswick, have adopted similar inter-provincial reciprocal succession duty laws.

The principal examples of direct federal control are Germany and Switzerland. In Germany the federal legislation goes back to 1870; it was amended in 1909 and again in 1923. According to these laws real estate and so-called fixed

industry (*stehendes Gewerbe*) can be taxed only in the state of location or operation. If the business is conducted in more than one state, the tax is apportioned among the states; final appeal lies with the federal court, which is empowered to settle the allocation in each case. In Switzerland the constitution of 1874 imposed on the federal diet the obligation to prevent intercantonal double taxation, but the legislature transferred the responsibility to the federal courts. The supreme court has laid down the general rules to be followed but in difficult cases makes the apportionment itself.

In the United States a third group of methods has been adopted to avoid double taxation. Inasmuch as the federal constitution grants no definite right to the federal government to intervene, the activity of the Supreme Court is negative rather than positive. The power to enforce a uniform system upon the states has been expressly disclaimed (*Kidd v. Alabama* 188 U. S. 730). But the application of the principle of equal protection of the law has led to decisions declaring certain state practices invalid and thus contributing to the beginnings of uniformity and the avoidance of double taxation.

In the case of the general property tax it had long been settled that real estate was taxable only in the state of location. The older rule that movables follow the owner and are taxed on the principle of domicile has recently been modified by adjudging taxable in the state of situs not only tangible personalty but in some cases intangible property like bonds, bank deposits and even open accounts or credits. But the decay of the general property tax and the infrequency of attempts to tax intangible personalty have minimized the practical importance of these decisions.

It is chiefly in the inheritance tax that the effort to avoid double taxation has of recent years become important. The decisions that a state may not tax a resident decedent's personalty if located in another state and that a state may not tax the devolution of a non-resident decedent's personalty even if the property is located in the state have led to a gradual decrease of double taxation, through the adoption by many states of reciprocal provisions based, so far as concerns the succession to personalty, on the acceptance of the theory of domicile. In the case of the now rapidly spreading income taxes the federal decisions are only just beginning. A few states, notably New York,

have already adopted reciprocal provisions for the avoidance of double income taxation. Much still remains to be done, for the situation in both inheritance and income taxes is complicated in the domestic almost as much as in the international field by the conflict of interests between debtor and creditor states. A recognition of these difficulties led to the suggestion of a possible solution of the problem, which takes account of both the economic allegiance of the taxpayer and the economic basis of the tax; it is more immediately applicable to the inheritance tax. It has been proposed that the tax be assessed by the federal authority and a part of its yield distributed among the states, the criterion of apportionment to be constructed in a manner comparable to the so-called prosperity index of the Dawes report for Germany. Two components of such an index obviously are population and real estate values; but as these would favor the creditor states they might well be supplemented by other measures such as relative railroad trackage, telegraph and telephone mileage, mineral deposits, water and kilowatt power and the like.

Most progress in the avoidance of double taxation in the United States has been achieved in the apportionment of corporation taxes, first of public utilities and more recently of ordinary business corporations. In the latter case there are three typical systems, represented respectively by New York, Massachusetts and Wisconsin. Among the criteria of allocation used in varying proportion by these states are the relative amounts of tangible property, of bills and accounts receivable, of gross receipts, of cost of goods, of wages, salaries and commissions, of gains from the sale of capital assets and the like.

Double taxation by the same jurisdiction in a unitary state is of less present significance than double taxation through a conflict of jurisdiction. The older problems connected with the general property tax—the simultaneous taxation of real estate and the mortgage thereon, of corporate assets and corporate stock, of the corporation and the stockholder, of personal property and the evidence of debt—have largely disappeared in the United States with the breakdown of the tax itself. Of more importance are the newer problems such as the simultaneous taxation of property and the income therefrom, the inclusion in the personal income tax of the yield of real estate already taxed, the imposition of both a corporate and a personal

income tax and the inclusion in a personal income tax of the dividends of corporations otherwise taxed. In the last two cases there is a bewildering confusion of legislation in various countries: the absence of a corporation tax and the inclusion of dividends in the personal income tax; the presence of a corporate income tax with total exemption of dividends from the personal income tax; a corporate income tax with exemption of dividends only from the normal personal income tax; and finally a corporate income tax with inclusion of dividends in both normal and supertax. No practical solution of these problems can be hoped for until more progress has been made with the theory of the subject.

DOUGLAS, STEPHEN ARNOLD (1813-61), American statesman. Douglas, who in posthumous fame suffers by being made a foil for Abraham Lincoln, was at the climax of his own career widely thought to be the most patriotic and sagacious of American statesmen. Born in Vermont and impoverished in childhood by his

father's death he went west as a youth in search of opportunity and found it in the practise of law and politics in Illinois. Entering public life as a Jacksonian Democrat he became in Congress the leading spokesman of western interests, with special concern for the prosperity of Chicago and the opening of fresh areas for settlement in that latitude. In the interests of Chicago he fostered most effectively the beginnings of the Illinois Central Railroad, which by joining the Great Lakes and the Gulf increased enormously the city's commercial advantages.

As early as 1848 Douglas contended that the determination as to Negro slavery in each new jurisdiction should be vested in the citizens thereof. The peculiar circumstances of the period gave this doctrine of popular or "squatter" sovereignty a special importance. Actually there were no remaining unorganized areas into which the plantation system of industry, with its adjunct of slave labor, was likely to spread. Alignment of the South against the North on the technical question, however, made it a paramount issue. At the same time New England's unwillingness to have her labor attracted westward caused a number of eastern congressmen to vote against proposals for organizing new territories. To break this alliance of South and East against his long cherished desire of organizing a Nebraska territory Douglas, as chairman of the Senate committee on territories, when reporting a new bill in the winter of 1853-54, sanctioned a repeal of the Missouri Compromise restriction on slavery and proposed the organization of Kansas and Nebraska by referring the slavery question therein to their future inhabitants. This proposal captured enough southern support to procure enactment, but instead of solving it intensified the territorial phase of the slavery question. The Republican party was launched to redress the "crime against Kansas," while southern chagrin at Douglas' impartiality in defending his "popular sovereignty" doctrine produced a rift in Democratic ranks. In their famous joint debates of 1858 Lincoln evoked from Douglas a reiteration of his abiding faith in "popular sovereignty" and an explicit denial of southern contentions based upon the Dred Scott decision, a denial which permanently alienated the pro-slavery elements in the Democratic party. Since 1852 the "Little Giant" had been a strong aspirant for the presidency, and in 1860 he was the one Democrat with a prospect of election if harmoniously nominated. But he procured nomination only by a rump convention and was

easily defeated at the polls. Upon Lincoln's election Douglas denounced all projects of secession and in the few remaining months of his life gave full support to the national cause.

DOUGLASS, FREDERICK (1817-95), Negro antislavery agitator and orator. Cruelty, starvation and unrelenting toil in his early life as a slave in Maryland bred in Douglass the implacable hatred of human slavery which was to determine the course of his life. At twenty-one years of age he made his escape and eventually reached New Bedford, Massachusetts. In 1841 while attending an antislavery convention in Nantucket called by William Lloyd Garrison he was invited to speak. The earnestness, logic and brilliance of his unprepared address caused him to be engaged as an agent of the Massachusetts Anti-Slavery Society, as "a recent graduate from the institution of slavery with his diploma written on his back." Despite attempts to kidnap and return him to slavery and despite beatings, showers of rotten eggs and countless dangers and indignities Douglass spoke eloquently wherever he could against slavery. His eloquence gave extraordinary impetus to the slowly rising antislavery sentiment, and his mere presence forced realization of the potentialities of the Negroes.

The publication in 1845 of the first of his three autobiographies increased the dangers surrounding Douglass and obliged him to leave the United States. He went to England, Wales, Scotland and Ireland and through lectures and writing created a tremendous sentiment for abolition of American slavery. Returning to his own country in 1847 he established and edited at Rochester, New York, a newspaper, the *North Star*, with which he carried on the struggle. Frequently he conferred with John Brown, Garrison, Harriet Beecher Stowe and other abolitionists. Douglass flung himself wholeheartedly into the campaign to elect Abraham Lincoln president. He helped organize the famous Fifty-fourth Massachusetts, a Negro regiment which gained great distinction under Robert Gould Shaw in the assault on Fort Wagner. After the Civil War he labored incessantly for enactment of the thirteenth, fourteenth and fifteenth amendments to the federal constitution. He held a number of political offices; he was commis-

sioner to Santo Domingo, minister to Haiti, counsel for the government and recorder of deeds for the District of Columbia and presidential elector-at-large for New York.

Douglass held that as long as any race, sex or other group was denied freedom no group was safe. He therefore became one of the pioneer advocates of woman suffrage and materially aided Lucretia Mott, Susan B. Anthony and other advocates of votes for women. Douglass can without doubt be ranked as the first Negro to combat the subjugation of his race with uncompromising, direct and logical action.

WALTER WHITE

Consult: Douglass, Frederick, *Life and Times of Frederick Douglass* (rev. ed. Boston 1892); Washington, Booker T., *Frederick Douglass* (Philadelphia 1907); Holland, F. M., *Frederick Douglass, the Colored Orator* (rev. ed. Philadelphia 1895).

DOUWES DEKKER, EDUARD (Multatuli) (1820-87), Dutch writer and publicist. His activities fell in a period of enormous importance for the development and regeneration of Dutch life. In a country astir with growing commercial and industrial interests and efforts Multatuli more than any other man became a power for reshaping the general spirit and outlook of the nation.

At the age of thirty-seven he returned to Holland from the Dutch East Indies, where he had been a government official. His literary career was begun with *Max Havelaar* (Amsterdam 1860; tr. by W. Siebenhaar with introduction by D. H. Lawrence, New York 1927), a polemic in the form of a novel. It was an attempt to expose the connivance of Dutch officialdom in Java with the tyranny and corruption of the native rulers. Uniting a penetrating sentiment to a powerful logic it fell like a thunderclap on the peaceful but rather slow and ruminating Dutch and was at once recognized as one of the classics of the national literature. The question of the Dutch East Indies occupied his mind until the end of his days, but his activities soon widened out to the greater and more general problems of life. In a series of books called *Ideën* (7 vols., Amsterdam 1862-77) he set himself to renovate the spiritual life of Holland in its various aspects: political, cultural, artistic, religious. Although he detested capitalism he was too much an individualist to join the socialist ranks. His uncompromising attacks on the orthodox forms of religion and on the conventional morality of his days drew to him the enmity and hate of the powers of tradi-

tion and conservatism. But there had never been a figure in Dutch history that gathered round him to the same extent all that was alive and generous in the youth of his country, and before the end of his life his work had resulted in that remarkable revival of Dutch intellectual and literary life which found its brilliant center in the monthly review *Nieuwe gids*.

DOVE, PATRICK EDWARD (1815-73), English philosopher of land reform. Of a seafaring family, active, learned and accomplished, Dove spent a number of years as a country squire at Ballantrae. He acted as agricultural adviser to the neighboring farmers, refused to have a gamekeeper and helped provide employment during the potato famine of 1846. He was the author of several works on politics and economics. His leading work, *The Science of Politics*, was published in two parts: first (anonymous), *The Theory of Human Progression and Natural Probability of a Reign of Justice* (London 1850); and, second, *The Elements of Political Science* (Edinburgh 1854). The manuscript for the third part was lost.

Dove regarded land as a God given source of livelihood and hence the property of all the people. The nation, he argued, should therefore be the sole landlord and rent the only tax. He was one of the first to advocate complete nationalization of the land and represented the same wave of feeling as Mill and as Spencer in the early version of the *Social Statics* (London 1851, revised and abridged 1892). His picture of unearned site rent and his specific arguments for the single tax anticipated Henry George. Thus he said that this tax would be simple and easy to collect; it would insure to the country all the benefits of free trade; "it would secure the greatest possible production of which the soil was capable"; and, finally and most important, "it would secure to every labourer his share of the previous labours of the community."

Dove developed his argument from a philo-

sophical basis. Dedicating his work to Victor Cousin he pointed out that a country's practical policies follow the "credence" of a previous generation. He devoted himself to showing the folly of adhering to an outworn system of property faiths. Our ancestors' notions of "property" and the law embodying them, he argued, have as little validity for us as their definitions of "crime." Historically, private property in land in England grew out of feudal benefices with military service attached. As the military service died out, taxation of the common people for state expenditures was substituted but the landlord remained. This double burden is unjust and crippling. Let the state resume its lost rights by buying and taxing out the landlords and letting its lands to the highest bidders. Beyond this Dove accepted individual enterprise.

DOROTHY W. DOUGLAS

DOW, NEAL (1804-97), American temperance reformer and publicist. Dow was born of Quaker parents and received his secondary education at the Friends' Academy of New Bedford. From the discipline of the Society of Friends he inherited a hostility to the liquor traffic, an attitude which was strengthened still further by his later experiences as an employer of labor in the tanning and lumber industries and as an overseer of the poor in Portland, Maine. His writings stressed the economic waste which resulted from intemperance, especially as this waste was manifested in the proportion of labor turnover due to excessive use of intoxicants by industrial workers.

Dow was an ardent advocate of prohibitory legislation. Withdrawing from the Maine State Temperance Society in 1837 he was instrumental in forming the Maine Temperance Union, which undertook a long campaign to gain control of the state legislature. With great political skill he finally secured the passage of the famous Maine law of 1851, which embodied his theory of a comprehensive prohibitory statute. As mayor of Portland he dramatized the enforcement of the law and in numerous speeches and pamphlets defended its underlying philosophy. In his campaigns he constantly resorted to a system of "pressure politics" within the Whig and Republican parties, and therefore looked with misgiving upon the organization of the National Prohibition Reform party in 1869. Eleven years later, however, he became its nominee for president. Few if any of his con-

temporaries were so influential in promoting the idea of state prohibitory legislation.

DOWER AND COURTESY. *See* MARITAL PROPERTY.

DOWRY. Ordinarily dowry is the property which a man receives when he marries, either from his wife or from her family. It is not common among primitive people, but it seems to have developed independently in several centers. It presupposes organized family units and a property basis of society. Dowry can hardly be imagined in societies in which any form of group marriage or communal marriage occurs; and it seems equally excluded in the rare instances we know of polyandry. But in both monogamous or polygamous (polygynous) societies it is likely to appear as a special development of what at first sight seems to be its opposite, the purchase of a wife and the payment of the bride price. Marriage by capture, which probably never occurred as a tribal custom, would not admit of the dowry system; but marriage by purchase, which certainly is to be found all over the world, frequently gives way to it.

It may be assumed that the system developed from the power often possessed by heads of families of selling their females either into slavery or into marriage. There may have been little to choose between the two situations as far as the power of the master or husband was concerned, but there must have been much choice from the point of view of buyer and seller. Daughters might be a source of income, as they are specifically said to be by Homer, but it is impossible to believe that in Homeric or in Biblical society the father manifested a complete indifference to the subsequent fortunes of his child.

In fact, purchase of a wife was regularly an affair between families who were likely to be associated as equals in other relationships. It implied a certain sense of family importance. The marriage even in the form of a purchase was an occasion for closer union. Again, erotic choice may from the beginning have played a part. Certainly such choice was not a negligible factor in Homeric or in Biblical marriages.

The price of a bride therefore would not be

calculated in the same manner as the price of a slave. It tended to become smaller and smaller, and finally in the Roman *coemptio*, as in the Frankish sale for a shilling and a penny (*per soldum et denarium*), it was purely nominal and was retained only as a ceremonial.

On the other side, gifts by the groom or his family to the wife, the Teutonic *Morgengabe*, or by the wife's family to the groom are encountered frequently. There is also found the institution of the trousseau, whereby the wife came to her husband with ample personal equipment. All these customs emphasized the idea that the daughter of one household entered another not as a chattel but as a person who did not altogether lose the support and affection of her kinsmen.

The idea that served for a long time as the underlying purpose of dowry was that the wife was to be protected in some fashion against ill treatment in her new home. This idea may be connected with the ancient and widespread doctrine that gifts are essentially conditional and that the implied condition is the maintenance of good relations between the donor and recipient. When a marriage was not merely a purchase but was accompanied by a sort of interchange of gifts, the good treatment of the wife seemed the necessarily implied condition. Indeed, such good treatment is specifically stipulated in several ancient marriage contracts.

The ill treatment contemplated was not physical abuse, which was very rare, but alienation or repudiation. The first was soon prohibited by legal sanctions, but the second was more difficult to guard against. In polygamous societies another form might be the degradation of the wife from a higher to a lower position in the harem. The device used to prevent this was sometimes an oath or a fine on the husband if he offended. But when economic conditions made the bridal price unimportant and developed the gifts to the husband into a real dowry, it became evident that the dowry itself, treated as a conditional gift voidable for the husband's misbehavior, would be an effective check on the kind of ill treatment apprehended. It became essential that no matter how complete the husband's control of a dowry during marriage he had to restore it if he divorced his wife or if she died childless, and as this restitution was to be made to her family it was almost sure to be claimed.

Although there was no lack of representatives to protect the wife's interests, legal restrictions were quickly found necessary to make the hus-

band's duty of restitution effective. We can trace this best at Athens and at Rome. In both communities when the dowry consisted of specific property—generally land—it was made inalienable by the husband, and in both communities specific or general mortgages might be placed on the husband's property to secure the return of the dowry.

We have a great deal of information about the general character of Athenian and Greek dowries both in literature and in inscriptions. As may be supposed, the amounts of dowries varied enormously, and in a number of cases they reached relatively high figures. Demosthenes' father gave his daughter a dowry of two talents, although his entire fortune was only fourteen talents. Portions like these make it possible to suppose that the dowry in such communities was originally the daughter's share in the inheritance paid to her at her marriage. There is a suggestion of a similar institution in the Bible, although ordinarily the term translated as dowry in the King James' version is the bridal price. But whether or not such a right of inheritance existed in ancient times, the historical dowry was not consciously connected with it.

The unmistakable effect of the dowry system as it showed itself in Greece and Rome was to strengthen the feeling of blood kinship as distinguished from the agnatic family. It also assisted the development of female independence in Rome and many Greek states, and even under the semi-harem conditions of Athens it gave the wife an increasing sense of importance. But it is obvious that its effect was limited to the propertied classes. The very poor, living from hand to mouth, had neither the means of endowing their daughters nor any reason for doing so. Among the wealthier classes not only was the amount of dowry a means of ostentation—a fact which called forth repressive and quite futile legislation—but an undowered marriage in these circles was a public scandal.

The legal problems connected with dowry interests became disproportionately prominent in the later Roman law even after the empire had become Christian. The church took the dowry system for granted. Perhaps it welcomed the aid, however slight, it gave in reducing divorces, which the secular law continued to permit despite the church's disapproval. It may also be that it was a distinct advantage to the church for women's control of family property to be increased, since women had always been generously disposed toward church foundations.

But the problem of dependence gave a new aspect to the dowry system which must have made it welcome to both church and state. The dowry was apparently intended to make the marriage of children of substantial families something like a union of equals despite the legal power of the husband in patriarchally constituted societies. Since marriages in ancient societies were regularly between very young people, the dowry was economically important in making it possible for the young husband to establish a new household, which alone he would have been unable to do. It is this which has seemed the principal justification of dowries in those communities, e.g. in continental Europe, where they are still formally maintained. Since a joint household is to be formed it has seemed only just that the two families involved should jointly contribute to its establishment. Yet the dowry must return to the wife—or to those who would use it for her—on her husband's death, just as it would in case of divorce; and to insure this the husband's estate was made responsible and the responsibility enforced by drastic legal remedies. The dowry thus served the purpose also of providing for the wife on her husband's death, taking the place of a compulsory share in the succession. It has tended to reduce the number of cases of widows left destitute—a matter of some importance in the absence of an insurance system.

This aspect of the dowry was the controlling one in an institution found in England and the United States. It is known as dower, which is merely a verbal variant of dowry and is translated by the same Latin word, *dos*. In its English form it was a life interest given to the widow in one third her husband's heritable land. In many states in the United States it was extended to all property and was frequently made absolute rather than merely for life. But in both England and America there is a growing tendency to make it conditional on the husband's dying intestate or to abolish it altogether.

From the very fact that the dower interest was in land, it is clear that it was merely an incident in the property relations of men and women of the upper classes. In England it was supplemented by marriage settlements, elaborate legal arrangements providing for the wife out of the husband's property in return for the enormous control the husband acquired over his wife's property. But more recent legislation has made settlements less important, and they have never gained a real foothold in the United States.

The dowry system has had a great many social repercussions both in the countries which officially recognize it and in those which do not. The most important of the latter are England and America. The open discussion of matters of dowry in continental Europe has always seemed to many classes of Englishmen and Americans a proof of gross indelicacy in personal relations and a negation of love as the basis of marriage. The result has been a romantic tendency in English imaginative literature to ignore economic realities.

The usefulness of the dowry system in accelerating the age at which men may marry—one of its chief justifications on the continent—has been overlooked. Indeed, the flexibility of the system is such that it can be made to serve almost any matrimonial purpose which is considered socially desirable. It may, for instance, occasionally serve as a means whereby an exceptionally endowed member of a lower or socially inferior class may be received into the upper class. The dowry must, however, necessarily remain chiefly an institution affecting only the propertied classes in any society.

DOZY, REINHART PIETR ANNE (1820-83), Dutch historian and orientalist. Dozy was educated at the University of Leyden, where he was professor of history from 1850 until his death. He became known as an orientalist by his prize work on Arabian costumes, published in amplified form as *Dictionnaire détaillé des noms des vêtements chez les arabes* (Amsterdam 1845).

For a number of years Dozy devoted himself entirely to the study of the Mohammedan dominion in Spain. Having thoroughly investigated the sources he published in 1849 *Recherches sur l'histoire et la littérature de l'Espagne pendant le moyen âge* (3rd ed., 2 vols., Paris 1881), a volume of purely destructive criticism. In it he ruthlessly exposed the unreliability of Conde's *Historia de la dominación de los arabes en España*, which had previously been regarded as the standard work on Moslem Spain. Twelve years later there appeared the *Histoire des musulmans d'Espagne, 711-1110* (4 vols., Leyden 1861; 3rd ed. 1881; tr. by F. G. Stokes as *Spanish Islam*, 1 vol., London 1913), one of the important contributions to historical writing, in which for the first time the Moslem dominion in Spain was given its proper significance in relation to world history. This work became and still is the accepted authority in its field. The first volume deals with the Arabs before the coming of Mohammed and with the civil wars; the second, with Spain in the time of the Romans, the Goths and the Arabian conquest; the third discusses Spain under the Omeiyads; and the fourth, the history of the minor dynasties succeeding the caliphate up to the time of the Almoravide occupation of Spain.

Dozy's second brilliant achievement was the monumental *Supplément aux dictionnaires arabes* (2 vols., Leyden 1881; 2nd ed. 1927), an invaluable aid to students of Arabic because of the author's extraordinary familiarity with Arabic writers. He also wrote *Het islamisme* (Haarlem 1863; 3rd ed. 1900), a popular exposition of Islam, and edited and translated many Arabic works on history and geography particularly in connection with Arabic Spain.

DRACO (last quarter seventh century B.C., exact dates unknown), Athenian politician and law codifier. To Draco belongs the credit for

having reduced to writing about 621 B.C. the customary law of Athens. Prior to that time knowledge of the laws was confined to the ruling classes, who had in consequence practically an unlimited mastery over the community. A passage in Aristotle's *Politics* (II: 12), written nearly three centuries later, speaks of the severity of the punishments in Draco's laws and from this the concept of Draconian as equivalent to barbarous appears to have arisen. Plutarch in his life of Solon says of these punishments that death was appointed for almost all offenses; others have stressed the creditor's power to seize the debtor's person; but the latter appears also in the Twelve Tables two centuries later, and capital punishment was never used sparingly in archaic law. This traditional severity, however, does indicate that the code was preponderantly a penal instrument; while its earlier appearance lends probability to the view that it was even less systematic than Solon's legislation, which "had but little order." While it was less permanent than the Twelve Tables Draco's collection resembles the latter in marking the transition from consuetudinary to written law. It established Draco's fame as one of the notable world figures who helped in the advancement of law to a more accessible and hence more serviceable form.

DRAHOMANOV, MIKHAILO PETROVICH (1841-95), Ukrainian nationalist and social critic. Born of a Ukrainian noble family, he began his career as a historian and publicist and became associate of the University of Kiev in 1865. Later he included the study of folklore among his interests and collaborated with Antonovich in a collection of Ukrainian historical folk songs. He was forced to resign from the university because of his political activity and went to Geneva, where he edited a periodical, *Hromada* (Society), from 1878 to 1882. He spent the last years of his life in Sofia as professor of history.

In his publication as well as in various pamphlets Drahomanov developed his socio-political program of Ukrainian nationalism. With "cosmopolitanism as the goal" his more immediate political ideal was an autonomous Ukraine within the borders of a federated, constitutional and democratic Russian state. He consequently opposed the centralizing tendencies of the Russian revolutionists as well as the separatist aspirations of the extreme Ukrainian nationalists. He urged the Ukrainian masses to participate actively in the struggle for political freedom and the establishment of a constitutional regime in Russia, but he disapproved of the activities of the terrorists and demanded "clean hands for a pure cause."

His views on social reform, which were of an anarchistic-Proudhonian turn, occupied a secondary place in his doctrine. They appealed, however, to the radical element, and it was largely through Drahomanov's initiative that in 1889 the Ukrainian Radical party was organized in Galicia to uphold the interests of the peasants.

DRAWBACK. A drawback is a device for relieving exporting interests, in part at least, from the disadvantages which they might suffer from the imposition of customs duties or internal revenue duties. Customs laws usually provide that import duties may be refunded or drawn back upon the reexportation of dutiable foreign goods and upon the exportation of domestic manufactures containing dutiable foreign material. The refund of internal revenue or consumption taxes paid either on the merchandise itself which is destined for export or upon contained materials is also usually classified as drawback. The drawback privilege may be limited to enumerated commodities, as in Italy and the United Kingdom, or it may be general, as in Canada and the United States.

Drawbacks differ from export bounties, as Adam Smith explained, in that drawbacks "can

never occasion the exportation of a greater quantity of goods than what would have been exported had no duty been imposed. . . . They tend not to overturn that balance which naturally establishes itself among all the various employments of the society; but to hinder it from being overturned by the duty. They tend not to destroy, but to preserve, . . . the natural division and distribution of labour in the society" (*Wealth of Nations*, bk. iv, ch. iv).

While the drawback since the time of Adam Smith has generally been regarded as a relief from protectionism it was originally a part of the mercantilist system and was used extensively in France under Colbert and in England during the eighteenth century. In England drawbacks were given especially for the encouragement of shipping; but their importance declined with the coming of free trade.

The United States has based its drawback system upon the purposes outlined by Adam Smith. Its tariff law of 1789 limited drawbacks to imported goods reexported in their original packages. The application of drawback was extended in 1861 to goods manufactured wholly from imported materials, but only 90 percent of the duties were refunded. The refund of duties on the export of goods made from a combination of domestic and imported materials was not authorized until 1890. At this time the refund was increased to 99 percent of the duties. Extreme protectionists regarded drawback with suspicion as an entering wedge which might disrupt their system and hence insisted upon all possible safeguards, both in legislation and in administrative regulations, against fraud and abuse. In 1919, however, the United States Tariff Commission reported that scores of American industries using foreign materials did not exercise the drawback privilege because the regulations designed to prevent fraud were so exacting and intricate that the amount of drawback received did not repay the cost of collecting it. So complicated was the procedure for making a claim and proving identity that only large scale industries, such as sugar and tin plate, which could afford to employ experts to look after these matters, could profitably take advantage of the drawback privilege. Although the procedure has since been simplified, still in 1929 only \$14,926,000 of duties were drawn back, principally on cane sugar, flaxseed, aluminum and sensitized films. There was a change of policy in the tariff of 1930 by the abandonment of the requirement of proof of identity in claims for

drawback on sugar, non-ferrous metals and ores containing non-ferrous metals.

In certain European countries drawbacks have become, whether by accident or design, bounties on exports. Difficulties arise in determining the amounts of drawback payable when the amount of imported raw material contained in a given lot of goods cannot be directly measured, as, for example, the amount of wheat in flour, and when certain materials, such as flaxseed, yield two products only one of which may be exported. In such cases arbitrary conversion ratios must be fixed to establish the amount of raw material, in a given quantity of manufactured product, on which drawback may be paid. But as manufacturing processes are improved the actual yields secured from raw materials exceed the official ratio, and exporters receive more in refunds than they have paid in duties. In this manner the drawbacks of internal revenue duties on sugar beets of various continental states became bounties. Farmers raised beets of higher sugar content and refiners increased the amount of sugar they could extract from beets. Corresponding changes were not made in the official ratios and substantial bounties on exports resulted. These concealed bounties were finally abolished by the Brussels Sugar Convention of 1902.

Export bounties may arise also from the payment of drawback on exports containing domestic material either in combination with imported material or alone. If proof of identity is required—proof that the exported goods actually contain a specific quantity of imported goods on which duty has been paid—the provisions may be so loosely drawn that domestic goods can be substituted for imports. Or the only proof demanded may be that duty has been paid on an amount of imported goods equivalent to that on which drawback is claimed. In this case a bounty to exporters may result from the failure of the import tariff to raise the price of domestic goods by the full amount of the duty or from the substitution in the process of manufacture of domestic goods of quality inferior to those imported. French drawbacks on woolen and cotton goods in the early nineteenth century illustrate this type of concealed bounty.

The improvement trade (*Veredelungsverkehr*, *admission temporaire*) permits, under bond for the amount of the duties to be paid if the goods are not reexported, the free entry into the customs area of a country of materials to be worked up and exported and permits the entry, duty

free, of foreign goods made from domestic materials. In Switzerland the improvement trade has attained considerable development, as, for example, in the importation of Irish linen to be made into handkerchiefs and reexported. The general purposes of drawback and the improvement trade may be accomplished by the establishment of free zones where foreign goods may enter without the payment of duty to be re-packed, conditioned or manufactured, as, for example, in the port of Hamburg or in bonded warehouses in Germany, France, the United States and the United Kingdom. In the last named country the system of bonded warehouses has practically displaced drawbacks. As a rule manufacturing operations are not permitted in warehouses, but there are exceptions, such as the milling of wheat and smelting of ores in bond in the United States.

Negotiable export-import certificates (*Einfuhrscheine, titres d'acquits à caution*) represent a development of the drawback in a direction far removed from the original idea. These negotiable certificates are issued upon exportation and may be used in the payment of import duties either on commodities of the same kind as those exported or on a specified list of commodities. Both in France and in Germany the use of these certificates has brought about marked disturbances in that "natural division of labor" which drawbacks are supposed to maintain. In the United States the proposed export debenture, which it is claimed resembles drawback, represents an extreme use of the export-import certificate plan amounting in effect to export bounties.

DRESS. For the history of dress there are roughly four fields of study: prehuman behavior, archaeology, primitive peoples and modern civilized conditions.

The study of animal behavior emphasizes two facts regarding the origin of clothing. In the first place, human dress, in so far as it is for protection against the elements, has no continuity with any prehuman behavior. Ani-

mals in frigid climates grow warm coats, which are transmitted to their offspring by heredity. The opposite technique of invention and traditionally transmitted processes does not occur except in man. In the second place, observation of the higher apes has emphasized the prehuman roots of clothing as self-decoration. Köhler describes the naïve delight of chimpanzees in hanging objects about their bodies and trotting about to display them.

Archaeology reveals nothing about the history of dress until the upper palaeolithic era which is far removed from earliest man. Clothing is necessarily of perishable materials, but even ornaments of animal teeth, ivory and shells begin to appear only in the Aurignacian period at the same level at which is found the characteristic palaeolithic development of mural drawing and engraving. From this period date also the characteristically distorted nude figurines of the female form, some of which are wearing bracelets although they are not represented with any other clothing. It is obvious, however, that the distortion of these female figurines is in the direction of fertility symbols, and their nudity furnishes no information as to women's daily wear in the Aurignacian period except that bracelets were worn at this period.

The reasons that have led man to clothe himself can therefore be studied chiefly from a comparison of the divergent behavior of now existing peoples. There is a strong association in western civilization between dress and the covering of the sex organs, but most of the literature concerning the origin of clothing has directed its array of facts to demolish the assumption of the primacy of this connection and to point out that dress did not have its origin in a specific instinct of modesty focused on the organs of reproduction.

It is obvious from any study of primitive clothing that this particular function of dress has very often been unknown in other cultures. The habit of complete nudity has a wide distribution in the tropical regions of South America, Melanesia and Africa. In some cases both men and women are habitually naked, in others only the men, in still others only the women. Even outside of tropical regions habitual nudity is widespread, although a skin may be thrown over the shoulders for protection. Such regions are the Great Basin in North America, California and Australia. Even in arctic regions, where well tailored clothing is universal, the

conventions are often such that both men and women are habituated to indoor nudity and like all people so habituated exhibit no shame in uncovering. Nansen describes the intercultural cord of the east coast of Greenland, the sole covering of the natives when indoors, as being "so extremely small as to make it practically invisible to the stranger's inexperienced eye" (*Paaski over Grönland*, Christiania 1890, tr. by H. M. Gepp as *The First Crossing of Greenland*, 2 vols., London 1890, vol. i, p. 338-39, vol. ii, p. 277-78).

In more extreme instances that may be brought to bear against this theory of the origin of clothing in an instinct of modesty the very nature of the coverings themselves is the point of the argument. The codpiece which was worn in Europe about 1450 and the custom of the men of certain Papuan tribes who squeeze their members into the opening of a gourd are indicative of the exhibitionist nature of certain forms of dress. Many observers in many parts of the world have commented on the fact that the most obvious function of the genital coverings was to attract attention rather than to divert it.

It is possible therefore to discard the notion that there is a human instinct of modesty that expresses itself in clothing. Modesty is a conditioned reflex and has its roots in the fashions of dress to which any group is accustomed. It is therefore to be expected that, given certain turns of fashion, other regions than the genital will be singled out and this emotion directed elsewhere—to the feet, as among Chinese women of past generations, or to the face, as with Mohammedan women. Native Brazilian women are extremely unwilling to remove their nose plugs and Alaskan women to remove their enormous labrets. Feelings of shame may also be associated with types of behavior not connected with clothing. Perfectly naked savages, for example, show acute feelings of shame at seeing anyone eat in public.

All the other theories of the origin of clothing contain varied amounts of truth. Their advocates have erred only in too generalized a support of their particular positions. It is not necessary to deny any of them, once one has granted that human custom has no unique root but in different parts of the world has been the result of quite different circumstances and habits of mind variously interacting.

Thus Frazer and Karsten argue for the origin of clothing in ideas of magic, as, for example,

the covering of the organs of reproduction in order to prevent the evil eye being cast upon them. Amulets hung about the neck or inserted in the lip or the nose are the full scope of clothing among some peoples, and in those and similar cases costume can be most pertinently studied in connection with local magical beliefs. In some regions these have had a profound influence upon the development of dress, but it is not necessary to generalize them as the origin of clothing.

The theory that clothing originated in protection against the rigors of climate is defended by Knight Dunlap. To doubt that weather has ever been a factor would be to cast a gratuitous slur on human intelligence and to ignore one of the great differentiations between human and animal behavior. If it were the primary factor, however, the primitive tribes living in the cold climates of the southern hemisphere would have provided for themselves as well as those living in similar climates of the northern hemisphere. But they have not done so. For the freezing weather to which they are seasonally exposed the Australians and the Fuegians do not make themselves clothing but barely protect their shoulders with a skin. Certainly many other motivations have been as potent in the history of clothing as protection against the weather.

Westermarck considers dress under the heading of "Primitive Means of Attraction." He believes that it is fundamentally rooted in the erotic impulses. Instances of this sort have been given above and he presents many others, both of habitual ornamentation of the public coverings and of ornamentation worn for particular occasions, such as dances, especially those of a licentious character. The history of clothing in our own civilization is ample evidence of the degree to which one sex dresses for the other, and certainly the often recurring differentiation of the dresses of the two sexes should be studied from this angle.

It does not seem necessary, however, to single out the one trait of display before the opposite sex when dress is so obviously and so often a self-display on all counts. Sex display in dress may hardly appear in a given area, but display of trophies or display of status may be fundamental. Thus on the plains of North America men's dress is a heraldic display of war counts, and on the northwest coast a man's hat will be built up in cumulative units to designate his rank. As an old explorer said of the Fuegians, "although they are content to

be naked, they are very ambitious to be fine." This impulse toward decoration is the most constantly recurring motivation in the history of clothing and, as we saw above, the one which is found also among the higher apes.

Modern conditions have introduced only one important factor into human behavior in regard to clothing. In all that has been said above, modern dress like that of any other period is merely one of many possible varieties all illustrative of the general principles. But there is one fundamental difference. Whereas in simpler conditions, even in untouched rural districts of Europe today, dress is geographically differentiated, in modern civilization it is temporally differentiated. This rise of fashion in the field of dress had begun somewhat tentatively between the tenth and the fourteenth century, but it is with the Renaissance that its full and startling effect is first to be gauged. In rural districts dress remained and has remained to the present time a matter of local individuality perpetuated for centuries with great conservatism. The revolutionary rise of fashion had to do only with the urban population and even more specifically with the court. Its onset in the fifteenth century was marked by those peculiarities that have continued to characterize fashion in the modern world: first, the grotesque exaggeration of certain features, in this case notably the hennin (the fantastically elongated headdress that was held on by a chin band); and second, the personal arbitership of the great lady, which is said to have been already a well developed role of Isabelle of Bavaria, wife of Charles VI.

From this period fashion has been of unceasing importance in the field of dress. The latter part of the fifteenth century and the earlier part of the sixteenth show some of the most pleasing of all western European fashions, styles that are best known through the portraits of the Italian Renaissance. In the first half of the sixteenth century the woman's hoop skirt was elaborated, and this returned in extreme forms in the mid-eighteenth and mid-nineteenth centuries, in less extreme form in the mid-seventeenth. In the eighteenth century version in the reign of Louis XVI this was coupled with spectacular display of costly material in garments; clothes became a primary means for the ostentatious exhibition of wealth. The greatest excesses were cultivated in the matter of hairdressing; coiffures were a half yard high and prints show the hairdressers

seated on ladders in order to reach the upper tiers of their creations. Nor was there any marked improvement during the nineteenth century. Probably the fashions of the period from 1830 to 1900—the desperately constricted waist, the bustle and the heavy dragging skirt—were the ugliest and most unhealthful in the history of women's dress in western civilization.

The usual view of fashion is, first, that it is an affair of violent contrasts, each few years' swing of the pendulum reversing that of the preceding; and second, that it is essentially dictated by individual Parisian costumers. Kroeber, however, taking as a test case woman's full dress toilette from 1844 to 1919, has shown that, at least in the measurements he has considered, fashion's vagaries follow definite long time trends. This is clearest in the measurement of the width of the skirt, which for fifty years before 1919 had in spite of incidental variations become progressively more constricted. For almost as long a period previously it had in the same way grown progressively fuller, and its cycle therefore would be about one hundred years. The length of the skirt showed a similar trend. Its cycle for this period was about a third the duration of the width cycle, but even this is too long to be due to the influence of a single gifted designer. Kroeber does not claim universal validity for his examples but draws from them two conclusions: first, in a broader view styles not merely oscillate between two points but work themselves out in cycles of considerable length; second, these cycles are obviously longer than the reign of influence of any one designer and are therefore independent of even the most powerful costumer.

The study of fashion along with a variety of other cultural traits of modern civilization, such as mass production, can derive no assistance from the history of the world before comparatively modern times. Fashion is new in human history and its future course is not known. At present it marks, as Santayana says, that margin of irresponsible variation in manners and thoughts which among a people artificially civilized may so easily be larger than the solid core. It may well be that this swift succession of styles will maintain itself as a fixed characteristic of dress as a culture trait in our civilization.

DRINOV, MARIN STEPANOVICH (1838-1906), Bulgarian historian and nationalist. After a short career as a teacher in his native land Drinov went to Russia, where he completed his studies in historical philology at the University of Moscow. In 1873 he became a professor of Slavonics at the University of Kharkov, where he remained except for brief interludes for the rest of his life. Drinov was one of the founders of the Bulgarian Literary Society, which was established in 1869 and was the most important center of Bulgarian culture and nationalism at that time. It continued, as the Bulgarian Academy of Sciences, to be influential after the liberation of the country.

Drinov was the first to establish Bulgarian history upon a sound scientific basis. His writings on ancient Bulgarian history laid a foundation upon which later scholars were able to build. In 1869 he published two important works: *Pogled vrekh proiskhozhdeneto na Bolgarskiy narod i nachaloto na Bolgarskata istoriya* (Vienna), a study of the formation of the Bulgarian people and the beginnings of Bulgarian history, which opposed the theory of the Hunnish origin of the Bulgarians, and *Istorichesky pregled na Bolgarskata tserkva* (Vienna), which dealt with the historical development of the Bulgarian church. In *Zaselenie balkanskago poluoostrova slavyanami* (Moscow 1872), a pioneer work in Russian on the settlement of the Balkan peninsula by the Slavs, Drinov maintained that the Slavic settlement had begun as early as the second century. *Yuzhnie slavyane i Vyzantiya v x veke* (Moscow 1875), his work in Russian on the southern Slavs and Byzantium in the tenth century, was a clear picture of the oldest national organization of the Balkan Slavs and of the internal structure of Bulgaria after the fall of the first Bulgarian Empire. In addition to these principal works Drinov issued a number of studies on the ancient and

modern political, cultural and literary history of the Bulgarians. His collected works were edited by V. N. Zlatarski (3 vols., Sofia 1909-15).

In various Russian publications Drinov upheld Bulgarian national and ecclesiastical interests; in this way and through his activity as adviser of the Russian commander-in-chief during the Russo-Turkish war he helped the national cause. After Bulgaria became an autonomous principality he became a member of the Constituent Assembly and aided considerably in the administrative and cultural reconstruction of his country, particularly as the organizer of its educational system.

DRIVES, MONEY RAISING. The money raising drive is one of the doubtful contributions of American civilization. Although the drive was used elsewhere during the war, when one touch of propaganda made all men kin, and may still persist here and there, it is in the main restricted to the American scene. This may be due as much to the smaller role of the voluntary social agency abroad as to the acceptance there of the notion that philanthropy is the province of the upper classes, against whose comparatively small numbers no concerted drive is necessary. Essentially the drive is a phenomenon of mob psychology. In it can be seen in strange fellowship religious revivalism, the worship of Mammon, the adoration of success, the flair for efficiency, the shrewd sense for exploitation, the apotheosis of salesmanship, unconscious "justification by faith," grafted on a comfortable idealism.

In the brief history of its existence the money raising drive has been known chiefly in philanthropy, in institutional programs of building and endowment and in war financing. Its present primary importance is in the field of philanthropy, with educational institutions occupying the second place.

The component elements of the money raising drive made their appearance in somewhat the following sequence. Over a half century ago under the guidance of Charles S. Ward the Young Men's Christian Association used the drive method for raising funds. It was later adopted by other institutions, especially for

building funds and endowments. The next important factor was the financial federation of social work agencies which made a somewhat abortive appearance in Denver, Colorado, in 1887. It had appeared in Liverpool, England, fourteen years prior to that time. The first successful financial federation took place in the Jewish philanthropies of Cleveland in 1896 and was followed in 1905 by the non-denominational city wide charities in Elmira, New York, in 1907 by Washington, D. C., and in 1913 in Cleveland, Ohio, by one of the most important of city wide federations. A somewhat neglected precursor of money raising drives was the tag day, whose origin is probably unknown but which was recorded as early as 1908 in Chicago, where it occurred 137 times during the four years from 1919 to 1922. The final and most exuberant florescence of the money raising drive, its most extravagant, most successful and most vicious manifestations, appeared during the war of 1914-18.

Despite the basic setting of all money raising drives in mob psychology or its euphemistic representative, organized publicity, it would be misleading to identify the perennial drives with those characteristic of wartime fervor. The latter should be classed alone. They appeared in three fairly distinguishable forms: the nation wide drives for auxiliary war service undertaken by such organizations as the Young Men's Christian Association and the Red Cross, the local war chests and the Liberty Bond drives. It was only the last of these which in the excesses of war psychology developed into vicious mob coercion.

Unprecedented amounts were raised for war auxiliary purposes and later for refugee and foreign relief. The Red Cross, the denominational young men's associations, the Salvation Army and War Camp Community Service demanded millions of dollars and the refugee relief organizations followed suit. Each one of these drives would in peace times have been considered gigantic. In 1918 upon the initiative of the secretary of war seven of the largest agencies providing auxiliary services to the fighting forces or aid to their dependents combined their drives into one huge high powered drive, the United War Work Campaign, which raised over \$200,000,000. Between April, 1917, and May 1, 1918, the United War Work Campaign together with the independent drives by the American Red Cross and the Young Men's Christian Association netted the incredible total

of \$560,000,000, which would probably have constituted the record for the generation had it not been dwarfed into relative insignificance by the Liberty Loan drives for amounts running into the billions.

"War chests" were created in cities, counties and in at least one state, Michigan, as a reaction to the chaos resulting from the endless succession of special national drives, most of which assigned a quota to each community. The war chest was a two-edged measure designed on the one hand to raise the communal quota and on the other to protect the givers from assaults of countless special drives. The war chest brought with it almost automatically the financial federation of the local units of national agencies and the joint raising of funds for both local and national needs. Syracuse and Rome, New York, were the first cities to adopt the war chest and were soon followed by Columbus, Detroit, Cleveland, Rochester and Indianapolis.

The Liberty Loan drives called forth the total mob power of the population. At this point the United States probably differed little from European countries except that lacking the emotional power provided by their nationalistic traditions it substituted larger doses of self-hypnosis and hysteria. The presence of an enormous percentage of immigrants or descendants of immigrants from the enemy nationalities supplied a stimulus for fear and hatred that measurably abetted the hysteria. Appeal turned into intimidation, sabotage and physical assault, especially where the presence of enemy alien heritage proved a further incentive to ferocity or created a defensive superferior on the part of the "tainted" members. Although the nature, momentum and methods of the Liberty Loan drive may not have been unique, the intensification brought about by the incomparably larger funds sought, coupled with the recrudescence of the worst forms of patriotism involving the disregard of all sanctity of person and property, made the experience *sui generis*, a full recording of which, beyond a few fractional bits of testimony in progressive periodicals, remains yet to be made.

The chief money raising drives of the present day are mild reflections of the wartime examples. The chief representative is the general philanthropic drive, such as the Red Cross annual roll call and special disaster fund drives, the Christmas seal sales for antituberculosis societies, the Salvation Army drives and the Poppy Day of the veterans' organization. A

second type includes building and endowment fund drives by agencies like the Young Men's Christian Association, colleges, universities, hospitals and churches. The annual community chest campaigns of financial federations of social agencies, although philanthropic in intent, constitute a class by themselves.

Money raising drives have had but one purpose, that of raising money. This truism is necessary in view of the confusing incidental and historical claims that have been made for them and in view of certain special phases attaching solely to community chest campaigns. Taking for granted a conviction on the part of the sponsors as to the social justification for their particular objective, the drive resolves itself into the following preliminary steps.

The desired amount and the community's contributing capacity are determined. Persons who command public confidence are selected for nominal or actual responsibility and leadership; "prospects" and amounts which as groups or individuals they are likely to contribute are listed. Then there is built up an organization of the individual participants in the drive, who must be community members in good standing—leaders if possible. The refinements worked out in this last phase of the work present remarkable achievements in organization, especially as represented in such "trade teams" as those in the Federation for the Support of Jewish Philanthropic Agencies in New York. A few of the well established drives, such as the annual Christmas seal sale for antituberculosis societies, do not depend on such community participation but use an employed staff for much of the work. A suitable time free from disturbing factors or rival drives and preferably with sentimental possibilities is selected, and the public through expert publicity, chiefly in the press, is prepared for the drive. There is then the task of building up and maintaining for the duration of the drive a high pitch of interest through the press and pulpit meetings, posters, visible indices of progress, badges and the like. The extent and nature of this psychological stimulation depend largely although not exclusively on the standing and relative acclimatization of the drive. Successive community chest and hospital fund drives find, as the public becomes informed of their purposes and accustomed to their yearly appearance, that they can dispense with much of the special paraphernalia. As the psychological staging recedes in importance, the efficiency of the organization

must increase and improve. Finally, in order to prepare the public for a favorable acceptance of the next drive a report is made giving an account of activities.

It is clear that in all these steps two elements are combined in a variety of ways and proportions: expert technique and participation of an interested group. The latter is often the crucial test of the former. Thus have arisen schemes such as the organization of canvassing teams and companies headed by captains and lieutenants, either to exploit the psychological values of competition or to secure the complete covering of prospects. These in turn may be arranged geographically or on other principles of classification, the most effective of which has probably been the division by trades, with a group of canvassers responsible for the mapping of prospects and the soliciting of all persons considered contributors within each trade. When the drive is repeated periodically for the same purpose and addressed to the same constituency and as technique becomes routinized and the public trained for solicitation and giving, the technical personnel usually becomes a permanent salaried body. Since, however, for the vast number of drives undertaken by colleges, churches, hospitals and the like the expert cannot be a permanent fixture, there has grown up a considerable number of professional money raising experts, organized along commercial lines, advertising in suitable periodicals and accepting commissions for the task of "delivering the goods." Usually these firms work on a percentage basis and some add other money raising devices to their stock of wares, such as lists of special prospects, the preparation of publicity copy, mailing, checking and other services. There are perhaps a score or more such firms carrying on business at this time in the United States in addition to individuals and some intermittent practitioners. The amounts raised by them for various purposes run into millions of dollars annually.

Of the many problems that have arisen in connection with drives some are of interest chiefly to the sponsors of drives, while others have wider social significance. For example, it was recognized soon after the advent of the wartime drives that the givers were developing a distrust based on an uncertainty as to the actual need for the drive or the justification of the particular amount sought. To meet this growing uneasiness the National Bureau of Information was organized as an endorsing

agency on the pattern of the endorsement committees of chambers of commerce. Another increasing source of embarrassment as the drives began to lose the protective coloring of war glamour was the question of the responsible budgeting of the large sums collected in the relatively uncontrolled manner characteristic of many large drives. This particular problem assumed considerable importance for national drives in view of the fact that some of these were conducted on the commission system for collectors, individual or organized, who occasionally retained for stipend as much as half or more of the amount raised. Another troublesome question has been that of coercion upon employees where plants or entire industries are "quota-ed" in a drive. Firms or corporations as such have made large contributions, but in addition and occasionally as substitute or supplement the employed personnel has been called upon to contribute. This may be done in the interest of actual results or only for the purpose of boosting the number of contributors with the resulting appearance of greater distribution and democracy. At times—and not only for the Liberty Loan—contributions have been deducted from the pay roll, and refusal spelled dismissal. The problem of employers' contributions and of implied or expressed coercion varies from community to community with local traditions and personnel and has not as yet provoked steady or widespread discussion.

A number of the criticisms directed against drives, especially community chest campaigns, pertain more directly to financing, developing or controlling social work than to the drive method as such. These may relate to amounts raised, number of contributors, democratization of social work, education in social problems, control by concentrated groups, position of capital and labor, conservatism and radicalism. These are matters that pertain more strictly to questions of social work theory than to money-raising technique, especially in view of the general tendency for community chests to raise all their funds by continuous intensive methods, leaving the drive for building funds, endowments, disaster and foreign relief, educational institutions and hospitals. Although even these may at the moment be confronted by a weary public, a new war would find the drive ready for its uses in all its pristine strength of potential mob rule.

DROYSEN, JOHANN GUSTAV (1808-84), German historian. Droysen, born in Pomerania, the son of an army chaplain, was educated at the University of Berlin, where he was strongly influenced by Hegel and Boeckh, and held professional positions at Kiel, Jena and Berlin. He was active politically in the defense of the rights of the duchies of Schleswig and Holstein and was a member of the national assembly at Frankfort in 1848, where he had a chief part in elaborating the German constitution.

Droysen's historical work is characterized throughout by a strong practical political aim. With his youthful impressions of the War of Liberation always vivid in his mind he became the passionate apostle of Prussian-German patriotism and as such the founder of the Prussian school of historians which propagated the idea that the unity of Germany could be realized only under the hegemony of Prussia. This patriotic trend is evident even in his earlier works on ancient history, such as *Geschichte Alexander des Grossen* (Hamburg 1833; 6th ed. by R. Kiepert, Stuttgart 1925) and *Geschichte des Hellenismus* (2 vols., Hamburg 1836-43; 2nd ed., 6 vols., Gotha 1877-78), in which he was the first to use the term Hellenism to denote a whole cultural epoch. In these works he sought to demonstrate that only the military Macedonian monarchy had been able to bring together the disunited republican states of Greece and to extend the Greek civilization over the Orient. While he did not directly refer to the situation in Germany, the analogy to the German national situation was perfectly obvious.

Droysen's patriotic ardor led him to abandon the field of ancient history and to devote himself exclusively to the study of Prussian history. His *Vorlesungen über die Freiheitskriege* (Kiel 1846; 2nd ed. Gotha 1886) was in reality a practical program imbued with the liberal and

patriotic tendencies of Baron von Stein. In his pamphlet *Preussen und das System der Grossmächte* (1849) he gave the clearest expression of the need of Prussian leadership, and in his biographical masterpiece, *Das Leben des Feldmarschalls Grafen York von Wartenburg* (3 vols., Berlin 1851-52; 11th ed. 2 vols., Leipsic 1913), he presented the typical figure of heroism and energy. In his monumental *Geschichte der preussischen Politik* (14 vols., Leipsic 1855-86; vols. i-iv, 2nd ed. 1868-72) he attempted to prove the unchanging character of the Prussian state from its remotest origins and its consistent striving to develop to a German power.

In his *Grundriss der Historik* (Leipsic 1868; 4th ed. by E. Rothacker, Halle 1925; tr. by E. B. Andrews, Boston 1893) Droysen combated Buckle's conception of general historical laws. He emphasized the free will of the individual and elaborated the Hegelian idea of the national *Machtstaat*. He attacked Ranke's supposed objectivity and maintained that the historian's purpose was to understand and to interpret historical events in the light of current needs and problems. His ideas on historiography have received a new vogue in recent times and have been a strong influence on writers like Simmel, Troeltsch, Dilthey and Rothacker.

DRUG ADDICTION is associated with the use of the products of the opium poppy and of coca leaves.

Opium (from the Greek *opion*, juice) was first used for therapeutic purposes. The earliest known reference to it is in Assyrian medical tablets (see Thompson, R. C., *The Assyrian Herbal*, London 1924) under the term *arat. pa. pa.*—a possible origin for the Latin *papaver*. It is there also designated by the Sumerian ideogram *hul. gil.*, which dates from the fourth millennium B.C. and signifies joy (*hul.*) and plant (*gil.*), indi-

cating that the Sumerians were familiar with its euphoric properties. The method of collecting opium described in these tablets is the same as that in use today in opium growing countries. Later references are found in the Ebers Egyptian papyri, dated about 1550 B.C., which mention opium among approximately seven hundred remedies. It is not improbable that the Assyrians, Syrians, Egyptians, Persians, Turks and Arabs acquired their knowledge of the drug directly or indirectly from the Sumerians and Babylonians. Hippocrates, Herodotus, Vergil, Homer and other Greek and Roman medical and non-medical writers referred to the drug. About the year 40 A.D. Scribonius Largus described the method of procuring opium from the capsule of the poppy, and Dioscorides in the year 77 A.D. distinguished between the juice of the capsule and the extract of the whole plant, which he regarded as less potent. Later Pliny and Celsus described the medicinal uses of opium and Galen spoke enthusiastically of the virtues of opium confections. The drug became popular in Rome and was distributed by shopkeepers and itinerant quacks. Arabic physicians used it extensively. Avicenna (980-1037 A.D.) recommended it especially for diarrhea and diseases of the eye. Arab traders carried it to India before the time of Mohammed (570-632 A.D.), but its use there was doubtless spread by the Mohammedan invasion. Opium has been known in China since the seventh century A.D., when it was imported overland from India via Burma and Yunnan by Arab traders. The opium poppy is mentioned in Chinese literature as early as the T'ang dynasty (618-709 A.D.). The first Chinese mention of opium was in 973 A.D., when the reigning emperor ordered the preparation of a new herbarium in which the poppy was included as a cure for dysentery. From the twelfth century on medical writers mention the use of the poppy capsule in preparing a paste to be used for dysentery, a paste which is also mentioned later as a cure for diarrhea. Wang Hi, governor of Kansu, who doubtless came in contact with the Mohemmedans, wrote in 1488 of the method of extracting the juice from the capsule—the first description of this process in China. A Korean work of the same period (*Eastern Treasury of Medicine*) also describes the scoring of the capsule, gathering the juice and drying it in the sun. The trade originated by the Arabs was perpetuated by the Chinese and by the Portuguese and Dutch traders from India and from other opium growing countries, in

whose hands the trade remained until 1773, when English merchants from Calcutta engaged in it. The importation increased rapidly and in 1781 the East India Company took the trade into its own hands. At present the most important producing countries are Persia, India, China, Russian Turkestan, Afghanistan and Turkey.

In Europe opium was used in a disguised form in various therapeutic concoctions and confections containing many ingredients. Paracelsus (1490–1540), who administered opium to his patients, carried the drug in the pommel of his saddle and called it the “stone of immortality.” Platerus of Basel strongly recommended it in 1600 and Sylvius de la Boe, a Dutch physician, declared that he could not practise without opium. Van Helmont in the seventeenth century used it so frequently that he was called Doctor Opiatus, and Sydenham about 1680 writes that opium was the most efficacious of drugs.

In 1803 Derosne and two years later Scrutner succeeded in separating from the crude opium an alkaloid base now known as morphine, marking the beginning of modern alkaloidal medicine. Robiquet isolated narcotine in 1817 and codeine in 1832 and in the same year Pelletier discovered narceine, thebaine, papaverine, cryptopine, gnoscopine and xanthaline. Other alkaloids and their derivatives such as apocodeine, heroin, dionin and peronine followed later. Throughout the nineteenth century in Europe and in America opium continued to be used for almost every malady. Opinions differed as to its physiologic properties and as to its mechanism in disease, but all agreed as to its efficacy.

The social problems involved in the non-medical use of opium were evidenced first in those countries in which the poppy was cultivated and from which commerce carried opium to other parts of the world. The Persians, Turks and Arabs, all of whom cultivated opium, were noted for its use, and other countries such as India and China, to which opium was first carried by the Mohammedans presumably for medical purposes, became producing countries and *pari passu* consuming countries. The eating of opium for non-medical purposes developed in India and China, and in the latter country its use was interdicted before the smoking of opium had been introduced. The first known smoking of opium was by the Dutch in Formosa, who used it with tobacco as a preventive of malaria. From Formosa the custom was introduced into China about 1800, and soon opium was being

especially prepared for this purpose. The first anti-opium edict against the sale of opium and the opening of opium smoking divans is said to be that of Yung Cheng in 1729, although earlier edicts had been issued against tobacco smoking. The smoking of opium spread from China to wherever the Chinese migrated. It was brought to the United States by coolie laborers on the west coast. The first white man to smoke opium in the United States is said to have been a world tramp named Clendenyn (1868). The practise spread rapidly across the continent and occasioned prohibitory legislation first in the form of municipal ordinances and later of state laws. Practically every country has been invaded to some extent by the practise. The extent of the use of the crude drug and later of laudanum in Europe and America before the nineteenth century is not known. But with the discovery of morphine and of other alkaloids the problem of addiction grew rapidly, and just as the producing countries of the crude drug had become extensive opium consumers, so the countries manufacturing the alkaloids became heavy alkaloid consumers.

The hypodermic syringe discovered by Rynd of Dublin in 1845 and Wood of Edinburgh in 1853 became a factor in the spread of drug addiction. By the employment of this instrument to inject morphine and other derivatives of opium under the skin it was thought that the so-called opium appetite would not be stimulated as it had been by oral administration. This belief proved erroneous but as a result of it the hypodermic use of morphine as a drug of addiction has become in western countries the most common method of administration. In 1898 a further impetus was given to the use of opium through the discovery of heroin by Dreser in Germany. His claims and those of others were to the effect that it was free from habit forming properties and was useful in the treatment of opium addiction. Medical literature for the next ten or twelve years advocated the use of heroin, and it was not until about 1910 that the medical profession began to realize that heroin was as dangerous as morphine or other opium derivatives in addiction forming properties. Drug addicts in contact with the illicit traffic had already been aware of this. Heroin was taken orally and hypodermically and in addition came to be used by sniffing, a method earlier applied to cocaine. Its greater potency, the ease with which it could be sniffed and the rapidity of its absorption through the

mucous membrane of the nose made the drug popular as a drug of addiction. Since the adoption of local and national prohibitory laws heroin has become more profitable in the illicit traffic, and it is the most commonly handled drug along the Atlantic seaboard in the United States. The fact that its amorphous form permits easy adulteration has been a factor in this situation. Such a strong sentiment against heroin has developed in the United States that its importation and manufacture are prohibited, even though it is claimed in some medical circles that heroin possesses certain uniquely valuable therapeutic properties.

Wars have been responsible for an increase in the problem of addiction, although little mention of this factor can be found in available records until the advent of the Civil War in the United States and the Franco-Prussian War in Europe. So marked was the effect of the Civil War on opium addiction that it came to be known in America after 1865 as the "army disease." The World War also gave rise to many victims in all the participating countries, particularly in Germany, France and Italy, where the marked increase in drug addiction has been a matter of frequent comment in medical writings.

The medical profession has persistently shown lack of knowledge of and interest in drug addiction. When the practise of medicine was almost wholly empiric and the causes of disease were unknown and specific remedies were unavailable, treatment was directed at effect rather than cause. As pain, insomnia, nervous excitability or distress of some kind accompanies almost every disease and as desire for relief is practically universal, opium, the sovereign remedy for all of these symptoms, attained a popularity which has never been equaled by any other drug. This widespread use increased very materially the extent of addiction and it is quite probable that a hundred or more years ago the majority of addicts among western nations were the direct victims of the therapeutic use of the drug. As medical knowledge increased, especially within the last one hundred years, and therapeutic measures came to be directed more at causes and less at symptoms, the need for opium materially decreased. Better medical training and appreciation of the dangers of its continued use and of the difficulties surrounding its relinquishment by those addicted and in the past few decades the more widespread popular knowledge of its undesirable effects have tended to lessen the importance of the therapeutic

addict. Unfortunately, however, inadequate knowledge of tolerance formation and of the resulting dependence and unsatisfactory methods of treatment of existing cases have combined to retard medical progress in both the prevention and cure of this condition. The earlier concept that the use of opium was dependent upon a vicious "appetite" or weak mentality and more recently the ill judged enforcement in the United States of certain regulations under the federal narcotic law have deterred physicians from the handling of these cases. Estimates vary widely as to the degree to which the therapeutic use of opium now influences the development of addiction. It is unavoidable that some addicts be formed in the humane practise of medicine. Chronic, incurable painful maladies, the emergencies of war and accidents and injuries all contribute their quotas and such situations will continue as long as opium and its derivatives remain irreplaceable for the relief of pain. Other cases are formed from the use of opium in medicine with less pathologic justification. Studies made by the Committee on Drug Addictions, composed of representatives of the medical and social sciences interested in the problem, indicate that individuals are introduced to its euphoric properties needlessly by some physicians through either ignorance or carelessness. These practises may be expected to become less prevalent as higher professional standards and increased knowledge of the physical and psychic effects of opium on different personalities exert their influence. Patent remedies containing opium or its derivatives have led to the formation of many cases of addiction. Specious advertising in magazines and newspapers, billboard posters and handbills, as well as unscrupulous retail pharmacists, foisted upon the ignorant sick "remedies" for every conceivable human ailment. Cold "cures," consumption "cures," cancer "cures," "pain killers," soothing syrups and diarrhea cordials, practically all of them depending for what little virtue they possessed on opium, flooded the United States and other countries. Many individuals, discovering the potent drug in the mixture they had been taking, bought it over the counter in drug stores and continued its use unhampered by restrictive laws. The peak of the patent medicine industry in the United States was reached just prior to the passage of the Pure Food and Drugs Act in 1906. The decline of the industry began at this time, and it was further affected in 1914 by the passage of the Harrison Narcotic Act.

There are two effects derived from the use of the drug, the euphoric effect and the therapeutic effect. All cases should be classified according to two bases: the object for which the drug was taken originally and the predisposing influences, more than one of which may be operative in the same case. Those persons by whom the drug was first taken for its euphoric effect alone constitute the class whose addiction originated on a non-medical basis. Among them may be included addicts of all social groups who were introduced to the drug through association, curiosity, bravado or other social stimuli. The literature on the subject popularized the use of opiates. Medical writings such as those of Doering, Young, Jones and others warning against the dangers of the too free use of opium dwelt at such length upon its euphoric and stimulating properties and endowed it with such mysterious qualities that they developed an interest in the drug. It is doubtful if any single work has had a more far reaching influence in stimulating its readers to undertake hazardous experiments with opium than has Thomas De Quincey's *Confessions of an English Opium Eater* (London 1822), the forerunner of a host of other less brilliant but equally morbid productions. The traditions so commonly circulated as to its alleged aphrodisiac properties, the deliberate proselytism of traffickers and other addicts, examples in the orgiastic tendencies of certain types of social gatherings, have all increased the use of the drug. There are certain persons who by reason of their psychologic, emotional or temperamental characteristics become victims of the chronic use of the drug more readily than others, no matter what method of exposure, through medical use, environment or other means, may be involved. The statement has been made frequently that all addicts are constitutionally unstable. As yet sufficient evidence has not been produced to establish the validity of this hypothesis, for until the pre-addict has been studied and until the physiologic and psychologic mechanisms of addiction are better understood, due evaluation cannot be made of the influences exerted by the complex elements involved in the addiction itself upon the personality of the individual. Addiction may be acquired because of exposure to the use of the drug through the occupation of the individuals affected (pharmacists, nurses, physicians, etc.), through association with acquaintances who use the drug for therapeutic purposes but who ill advisedly pass on this knowledge, through

voluntary association of a vicious nature involving dissipation in many forms or through economic, domestic or other social or emotional difficulties leading to the euphoric use of the drug. Illness takes its place among the common predisposing causes of addiction. Regardless of the personality make up of the individual, environment or other contributory influences, an individual suffering from a chronic painful condition seeks relief and finds it in opium. As long as painful disease prevails and opium is the principal agent of relief, addicts will be formed by its use.

Illicit traffic in opium is enormous and reaches practically every corner of the earth. That it involves many tons of morphine and heroin annually in addition to opium prepared for smoking and that it is carried on in response to a very real demand are shown by many of the documents of the League of Nations. Seizures have been reported amounting to thousands of pounds, yet there seems to be no scarcity of smuggled drug; and individual histories of addicts show that morphine, heroin and cocaine are available practically everywhere in the United States and Europe. The very nature of the traffic is such that it cannot be defined with accuracy, yet the case histories of many addicts show that addiction is spread through the efforts of the retail peddlers.

The nature of opium addiction is not understood. It was early described as an appetite and its subjects designated as opium eaters (opiophagists). It has since been called a habit, addiction, mania and by other similar terms. Levinstein in 1877 termed it *Morphiumsucht* (morphine disease or craving). The French *morphinomanie* and the English morphinomania followed.

The time and amount required to establish addiction varies with individuals, but for whatever reason the drug is taken addiction will result ultimately if the period of time is sufficient. In the continued use of opium individuals are able to tolerate increasingly large amounts of the drug, amounts that would be fatal to the non-user. Addicts have been recorded as having taken 50, 100 or even 200 grains of morphine daily, but the great majority of morphinists use much smaller quantities and the percentage of individuals using less than ten grains per day is far greater than that using more. As a growing tolerance requires an increase in the dose in order to secure the accustomed relief and as the period of time over which the drug is taken

lengthens, it becomes increasingly difficult to abstain from its use. Once established, addiction to a moderate dose is as difficult to overcome as that to large doses. Certain authors also describe a state of dependence other than the tolerance already referred to, in which the functions of the body have become so dependent upon the usual dose of the drug as to be definitely disturbed when it is discontinued, as evidenced by the so-called withdrawal symptoms. Others claim that this dependence is only a psychological manifestation—a craving for the drug.

The withdrawal symptoms, whatever their origin, occur with greater or less severity in practically all cases where tolerance has been well established, when the accustomed dose of the drug is materially decreased or stopped entirely. From a clinical point of view the reaction is typical and is not produced by any other known drug or medical situation. The symptoms usually consist of the following, in the order of their development: restlessness and depression followed by yawning, sneezing, excessive mucous secretion, sweating, nausea, uncontrolled vomiting and purging, twitching and jerking, intense muscular cramps and pain, abdominal distress, marked circulatory and cardiac insufficiency and irregularity, faces drawn and haggard, pallor deepening to grayness, exhaustion, collapse and in some cases death. The symptoms attain their greatest severity in about forty-eight hours, gradually abating for a variable period of one to several weeks before they cease entirely.

Numerous theories have been advanced in explanation of the mechanism of the development of tolerance and that of the withdrawal symptoms. By Gioffredi, Hirschlaff, Mavro-jannis, Marikovsky, Mirto, Ferrai, Berri and Belgrano tolerance has been said to be analogous to the bacterial immunity in the case of certain diseases. This has been denied by Morgenroth, Pellini, Greenfield, Kolb and DuMez and is generally discredited today. Faust and Albanese have attributed tolerance to an increasing ability of the organism to destroy morphine; Cloetta, Morat, Biberfeld and Gunn ascribe it to a cellular immunity or resistance; Rubsamen, van Egmond, Langer, van Dongen, Jöel and Tamura to a combination of these two—an increased ability of the body to destroy the drug and cellular immunity or adaptations. Takayanagi added to the two preceding explanations that of an increased elimination of the drug. Other explanations of both tolerance and

the withdrawal symptoms, based on chemical changes in the drug and tissues of the body and their effect upon the central and vegetative nervous systems and on the storage of the drug in certain tissues, have been put forward by Brissemoret and Challamel, Loofs, Legewie, Wuth, David and Kahle. Marmé has explained the withdrawal symptoms on the basis of the formation of oxidymorphine, but this has been denied by Donath, Stark and Marquis. Hitzig stated that withdrawal disturbance was due to hyperacidity of the stomach and Sollier, Kraus and Schübel have attributed it to the sudden reawakening of glandular functioning. A general poisoning resulting from the paralyzing of bodily functions was offered in explanation by Pettay. Bishop explained the symptoms on the basis of the presence of a circulating antidotal poisonous substance. Cell assimilation of the drug with resulting dependence after continued administration is the explanation of Fauser and Ottenstein. None of the theories seeking to explain the state of tolerance or that of the withdrawal symptoms has been sufficiently well demonstrated to warrant its acceptance on the basis usually required for scientific demonstration, and there is no certain knowledge on these matters.

Addiction cannot be inherited, but it is conceivable, although not proved, that a predisposition to addiction may be inherited in certain temperaments, as, for example, the neurotic and psychotic. Tolerance to opium, however, may develop before birth and the child of an opium addicted mother will usually develop symptoms of opium withdrawal within twenty-four hours after birth. In some cases these symptoms are so severe that if the drug is not administered in suitable doses death will ensue. Many such cases have been reported, and the general practise is to supply opium in the form of one of the tinctures until the milk flow is established on the third day after birth. It is sometimes necessary to supply additional opium until the infant can be weaned and treated for its addiction. The current belief that opium prevents conception is not true, although pregnancy may occur with relative infrequency because of the fact that the continued use of the drug lessens or completely abolishes sex desire.

Methods of treatment based on the divergent theories of the nature of drug addiction have varied widely, each giving rise to enthusiastic advocacy. Treatment has been for the most part empiric or symptomatic, and there is no one procedure which is generally recognized as

specific or which can be applied successfully to the majority of cases of addiction with any greater degree of success than can any other. Treatments may be grouped into three types: abrupt withdrawal (Levinstein), rapid withdrawal (Erlenmeyer, Sollier and Pettey) and gradual withdrawal, probably the oldest of all methods. The rapid withdrawal method is probably the one most commonly employed in the United States, France and Germany, except in custodial institutions where abrupt withdrawal is the custom. In Great Britain the Departmental Committee on Morphine and Heroin Addiction of the Ministry of Health reached in 1926 the conclusion that the method of gradual withdrawal, requiring an average of about ninety days, was the probable choice in the majority of cases. Treatment by the substitution of other drugs such as hyoscine, *Cannabis indica*, the bromides, chloral, luminal and others from time to time has found adherents in all countries and frequently is combined with each of the other techniques described. The use of certain vegetable proteins by hypodermic injection has been advocated and unsubstantiated claims made for their value in this connection. The treatment of opium addiction, in so far as it consists in the removal of the patient from his drug, can follow any one of the above procedures, each of which will be successful in a variable proportion of cases but none of which can be stated to be in any way specific or rational from the point of view of the underlying mechanisms.

The methods for the successful handling of addicts vary, depending upon the origin of the addiction and the type of individual involved. The handling of individuals suffering from incurable painful maladies lies chiefly within the province of the attending physician. The problems arising out of the natural tendency of the patient to increase the dose should present no great difficulties to the well equipped medical attendant. Legally there should be no hindrances in securing supplies for such cases. Of the groups of individuals to whom the drug has been administered during self-limited or curable maladies the "normal," or mentally and psychologically stable, present no unusual problem. When their illness has terminated and the drug has been withdrawn they bear the incidental suffering, and when it is over they rejoice in their release and are not inclined voluntarily to use the drug again or, if so inclined, they appreciate and are deterred by the dangers of such use. The psychologically unstable and the mentally sub-

normal present considerably more difficulty. After the withdrawal by reason of the termination of the need of the drug they may be inclined to have recourse again to opium as the result of agreeable memory associations. Under stress and strain they will take the drug if it is available and may even go to considerable lengths to obtain it. The physician's early recognition of these tendencies and his skill and tact in the handling of individuals are crucial in these cases. They must be handled on the basis of their instability or subnormality and should receive society's best efforts toward emotional, mental, environmental and occupational rehabilitation. Active institutional treatment upon relapse, psychiatric clinics with social supervision through well organized follow up services and other social agencies adapted to their individual needs should be employed. Individuals addicted through self-medication and those who first took the drug through curiosity and bravado present the same problems and require the same treatment. The treatment of the group of individuals introduced to the drug through vicious associations presents the least encouraging outlook. Characteristics acquired through prolonged undesirable or vicious association keep these individuals without the purview of available control agencies until their activities have brought them into contact with police or custodial officials. Conditions in custodial institutions are not favorable either for medical or sociologic treatment. The smuggling of narcotics into these institutions is a matter of common occurrence, and not infrequently the first direct contact with narcotics is made in this way. The handling of the cases of this group presents all of the problems involved in the treatment of the antisocial and criminal types plus those incidental to narcotic addiction only.

In some of the countries in which opium is smoked or eaten the registration of users has been established and the numbers of those registered are available. The most trustworthy figures dealing with the numbers of consumers and with the amount of opium which they consume are those derived from documents of the League of Nations and are presented in Table I. These figures are by no means to be considered complete.

In China and some of the other countries where the alkaloids of opium, particularly morphine and heroin, have come to be used in place of the crude form of the drug with increasing frequency no figures are obtainable to indicate

the extent of their use. Similar figures for European and most of the Near Eastern countries and India are not available. In Egypt addiction to heroin is said to be rapidly increasing; T. W. Russell, commandant of the Cairo city police, in the annual report of the Central Narcotics Intelligence Bureau, of which he is director, for the year 1929 estimates that there are more than 500,000 addicts out of a total population of about 14,000,000, more than half of whom are users of heroin and the rest users of hashish (*Cannabis indica*).

TABLE I

NUMBER OF REGISTERED OPIUM SMOKERS AND AMOUNT OF OPIUM CONSUMED IN OPIUM PRODUCING COUNTRIES IN 1927

REGION	POPULATION (in 1000's)	AMOUNT ACTUALLY CONSUMED (in kg.)	NUMBER OF REGISTERED SMOKERS
Burma	13,212*	14,570	14,003†
British North Borneo	258	4,375	6,276
Brunei	40	455	
Ceylon	5,125	175	549‡
China (1923)		8,000,000**	2,250,000**
Formosa	4,099	37,323	29,536
French India	273	246	
French Indo- China	20,189	66,048††	
Hongkong	1,000	11,068	
Irak	3,161	488	
Kwantung	1,090		31,062
Macao	160	7,319††	
Malay States (Federated)	1,476	51,788††	
Malay States (Unfederated)	1,124	32,417	
Netherlands East Indies	51,887	59,103††	97,317
Sarawak	600	7,127	4,783
Siam (1926)	9,831	55,462††	
Straits Settle- ments	1,004	52,692††	

* Figures for 1926.

† 548 Burmans (including Shans), 13,288 Chinese, 167 Indians.

‡ Total number of consumers is 6591.

** Estimate of Dr. Wu Lien-Teh according to H. L. May, *Smoking Opium Conditions in the Far East*, a pamphlet published by the Foreign Policy Association (New York 1927) p. 24.

†† Quantity sold for consumption.

‡‡ An additional 10,129 kg. were sold.

Source: Except where otherwise indicated the statistics of this table have been compiled from League of Nations, Advisory Committee on Traffic in Opium and other Dangerous Drugs, *Summary of Annual Reports*, O. C. 877, Sess. xi, Annex iii (Geneva 1929) pt. iii.

Little is known about the extent of opium addiction in the United States prior to the Civil War. The first statistical study of opium addicts in the United States was made in 1877 by O. Marshall for the Michigan State Board of

Health. Through information secured from physicians in ninety-six towns and cities in Michigan he found 1313 opium addicts in that state outside of the larger cities. If the rate as determined from Marshall's data is applied to the population of continental United States as of 1874, the total is 251,936. According to Marshall his total was an underestimate, for pharmacists reported upon subsequent inquiries a considerably larger number of cases than those reported by the physicians. In 1913 the Jacksonville, Florida, health department reported 541 cases, or 0.8 percent of the population; this rate, applied to continental United States, gives a total of 782,118 for that year. The State Food and Drugs Commission of Tennessee in 1915, through a registration system not, however, uniformly enforced, determined 5000 addicts, which rate applied to continental United States gives 269,000. The New York State Commission in 1920, through incomplete registration, determined 39,000 cases, giving the estimated figure of 396,978 when applied to continental United States. The report of a committee appointed by the secretary of the treasury in 1918 estimated from a variety of sources that there were more than 1,000,000 addicts legally and illegally supplied in the United States. Kolb and DuMez in 1924, from an analysis of certain selected figures from previous surveys and on a basis of legally imported drugs, estimated smuggled drugs and world production figures, arrived at the conclusion that the number of addicts in the United States was about 110,000. In 1925-26 the Committee on Drug Addictions made studies in seven American communities, covering a total population of 2,200,000. In these studies 1019 addicts were found who obtained their drug legally. This ratio, applied to the total population of continental United States, would give a total of 52,955 addicts legally supplied. Even for this class of addicts this is a minimal figure, since factors operated to preclude a complete enumeration. Moreover, the total does not take into account the addicts illegally supplied, who undoubtedly outnumber greatly those legally supplied. In one of the communities studied it was found that of the individuals arrested for all causes during one year there were 734 addicts. If this figure is added to the number of legally supplied addicts, the resulting ratio for the population as a whole is 88,964 addicts. The number of addicts among city prisoners, however, forms but a fraction of the total number of addicts illegally supplied in

any community. In the one referred to the police department estimated the number of addicts securing illicit drugs to be between 10,000 and 12,000. Undoubtedly the actual number of addicts in the United States is far in excess of any of the figures given, although the findings of these studies comprising the most recent investigations and based on carefully conducted local studies represent the most accurate information available.

There is no reliable information as to whether or not opium addiction is increasing or decreasing in the United States at the present time. Whatever the exact figures in the United States and other countries may be, the extent of opium addiction is sufficiently great to indicate the existence of a major medico-sociologic problem.

The prevention of the formation of new cases constitutes probably the most important and far reaching of the problems involved in drug addiction. The first desideratum is to keep the drugs away from those who will or may misuse them through curiosity or vicious associations. As a first step in this procedure the control of the illicit traffic is paramount. Specific problems and the methods adapted to control of this traffic by international cooperation and effort will be considered elsewhere (*see* OPIUM PROBLEM). If these broader measures had made such progress as to be effective, there would be no need for other preventive activities; but the work of the League of Nations in this field has made little headway against the secure intrenchments behind which those financially concerned carry on their traffic. National efforts for controlling the channels of distribution of these drugs present the next logical line of defense (*see* FOOD AND DRUG REGULATION). In general the laws require that opium and coca leaves and their derivatives and preparations be supplied to the ultimate consumer only by registered physicians and pharmacists and that these drugs be handled by licensed dealers. The enforcement of such laws as the federal narcotic law in the United States is somewhat effective in the prevention of addiction in cases which develop as the result of self-medication. Illegitimate traffic is not curbed, however, through the federal law, which cannot successfully control smuggling from other countries. The control of the supply is directly bound up with the world production of the drugs, and the limitation of production necessitates effective and honest international cooperation. The drugs must be controlled at their sources, as the multitude of ramifications that

exist in their illicit end distribution gives rise to practical difficulties. There are state laws dealing with the traffic in these drugs, but federal laws developed as the result of the failure of one state to protect itself against traffic originating in another. State laws should provide equipment for extending and intensifying federal activities; but while every state in the United States has a narcotic law, the laws are not in harmony with the provisions of the federal law and effective operation is therefore considerably hampered. Also state institutional provisions under conditions calculated to induce voluntary commitment of individuals are negligible in this country. All existing efforts to control the traffic in drugs have failed to date. The broader methods of prevention may never hope to be effective as long as opium remains virtually irreplaceable as a therapeutic agent. The prevention here becomes dependent very largely upon the training, experience and wisdom of the practising physician.

The history and the social and medical aspects of cocaine addiction are so distinct from those of opium addiction that this subject requires separate discussion. Cocaine is an alkaloid derived from the leaf of the shrub, *Erythroxylum coca*, which is indigenous to, and is also cultivated in, Peru and Bolivia. The plant has been introduced successfully into other countries and is now cultivated extensively in Java, to a limited extent in Formosa and in certain sections of Africa. The cultivated plant produces a larger percentage of cocaine and convertible alkaloids than is found in the wild species. The stimulating and euphoria producing properties of the drug were known in South America in prehistoric times. It is said that among the Incas divine properties were attributed to it and for a long period its use was limited to the priests and nobility. Early European writers credited the drug with the marvelous properties of being able to create abnormal physical and mental powers, to fill the needs of hunger and thirst, to stimulate its users so that untold hardships could be borne without difficulty and even to induce insensibility to pain. In addition it was credited with marked aphrodisiac powers and the Incan Venus is represented with a branch of this shrub in her hand. Coca was used in the form of dried leaves, numbers of which were rolled into a quid and chewed. In order to hasten and possibly to emphasize the euphoric effect of the drug the native chewers carried a gourd filled with an

alkaline mixture of vegetable ash and pulverized calcined shells. The use of the plant was denied to the laboring class during the rule of the Incas. After Pizarro landed on the Peruvian coast in 1532 the Spaniards realized that the use of the drug could be turned into a revenue producing traffic and also that the submissiveness and output of native labor was much enhanced by its regular use. They therefore extended the use of the drug to the laboring classes. State taxes and at one time the revenue of the bishop and canons of the cathedrals of Cuzco were derived from the traffic in coca leaf. In the seventeenth century a religious controversy arose as to the propriety of giving the drug to children and of its use before communion, because certain theologians claimed that as it was an aliment it should not be so used; but Alonzo de la Peña Montenegro, bishop of San Francisco de Quito, declared that the plant contained no alimentary property and the threatened blow to the traffic was averted.

For about two centuries after the Spanish conquest the drug remained for the most part unaccepted in European medical circles, its very existence being denied by some. Claude Duret mentioned coca in his *Histoire admirable des plants et herbes esmerveillables et miraculeuses en nature* (Paris 1605); Nicholas Monardes called attention to it in his *Dos libros, el uno trata de todas las cosas q̄ traē de uras Indias Occidentales* (Seville 1565); Abbé Longuerue in the same century mentioned it in connection with native labor; Linnaeus, Father Julian and Boerhaave also described its properties.

Chemical studies of the drug resulted in the discovery by Niemann in 1859 of the alkaloid cocaine. Gardcka is said to have isolated the same substance, which he called erythroxyline, in 1855. Demarle about the same time noted that on chewing the leaves the pupils of his eyes dilated and that the sense of taste was lost for a considerable period, a fact which he attributed to the contained alkaloid. The next important discovery was that of Charles Fauvel, who published in 1876 a report on the anaesthetizing effect of cocaine on the mucous membrane of the mouth and pharynx. Koller of Vienna published in 1884 his discovery of the anaesthetizing effect of cocaine on the mucous membranes of the eye. His experiments on animals were extended to the use of the drug in his eye clinic, and its employment spread among ophthalmologists throughout the world. Later the anaesthetic effect of cocaine upon injection was discovered, which resulted in its extensive use in surgery.

The knowledge of the anaesthetizing effect of cocaine on the mucous membranes of the nose and throat led to its employment in catarrhal conditions to give temporary relief and comfort. This led to its frequent use in the form of a spray or powder for insufflation and to the manufacture of numerous "catarrh cures," the sale of which was rapidly extended by unscrupulous advertising. In addition it was used internally as a tonic and to relieve painful conditions of the stomach. These uses led in many instances to definite euphoria and to addiction.

In 1878, Bentley, a Detroit physician, claimed the successful treatment of a series of cases of morphinism by the use of cocaine. Bentley's articles aroused wide interest and his method of treating this intractable condition spread in this country and Europe. Dujardin-Beaumetz, who also reported on the value of cocaine in these cases, shares the odium of having initiated this method of treatment. The result was the establishment of cocainism as a substitute for morphinism and not infrequently the use of both drugs was continued. The influence of the therapeutic use of cocaine was of brief duration, for the attendant dangers became more apparent; and synthetic substitutes—alpha and beta eucaine, novocaine, butyn and others—were devised. Nevertheless, as the stimulating and euphoric properties of the drug became known more widely among the laity, particularly its aphrodisiac property, its use for purposes of dissipation spread and it became a drug of addiction in practically all countries.

The effects of cocaine are subjective for the most part and are evidenced at first by stimulation and exhilaration, progressing to inebriation. There is frequently dilatation of the pupils of the eyes, although this is not a constant symptom. Blanching of the nose is seen in sniffers after the taking of a dose and frequently this form of use later results in perforation of the nasal septum. Upon continued use or after the taking of large doses uncontrollable erratic twitching of certain muscles of the face may be observed, and visual illusions and hallucinations are experienced which may take the form of delusions of persecution. Not infrequently the use of the drug is abandoned voluntarily to put an end to the suffering occasioned by such psychic effects. Loss of appetite, emaciation, complete insomnia, loss of libido and marked mental and physical deterioration are symptoms of the more advanced stages of cocaine use. It is seldom that the use of this drug extends over a period of

more than a few years, as its toxic effects are so profound and so much more rapid than those of opium as to cause either death or abandonment within a relatively brief period.

Cocaine may be relinquished without the development of distressing withdrawal symptoms characteristic of opium, and special medical handling is not required. Some authorities claim that no tolerance to cocaine develops, that it is a matter rather of idiosyncrasy and that the large doses finally reached by cocaine users in an effort to experience its euphoric effects could have been taken with impunity by these individuals in the first place. Withdrawal symptoms are confined to prolonged sleep as reaction from the stimulating effect of cocaine and to muscular weakness, some nervous excitability and the effects of improper eating.

In the coca producing countries of South America the leaf is chewed very extensively, chiefly by the laboring classes. Many writers are opposed to prohibition of the use of the drug because they fear that serious labor and economic upheavals would result, since, while physically and mentally deteriorating effects eventually develop on continued use, individuals using it can subsist on a minimum of food while expending a maximum of energy. Three fourths or more of the coca leaf produced in South America is consumed in its crude form in the producing countries. In Java, where a considerable part of the coca leaf that enters commerce as material for convertible alkaloids is produced, the native grown leaf is not chewed, as this variety contains no cocaine as such.

In countries where the alkaloid cocaine is used by sniffing or injection the extent of its use has never been determined. Nor have systematic efforts been made to determine the extent of cocaine addiction. Recent European writers on addiction almost uniformly comment, however, on the increase in cocainism since the World War, especially in Germany, France and Italy. In the last named country there was virtually no problem of cocainism prior to the war. Cocaine addiction in the United States appears to have reached extensive proportions which attained their peak about the time of the enactment of the federal narcotic law. In the southern states cocaine was widely used among Negroes. With the high cost of the drug in the illicit traffic and the absence of the impelling incentives to continue its use which exist in the case of opium addiction, addiction to cocaine seems to be on the decrease, particularly addiction to

cocaine alone. Among the addicts who use both an opium preparation and cocaine, when circumstances render the acquisition of these drugs difficult cocaine is relinquished with but little struggle, while great sacrifices will be made to avoid the pain and discomfort of opium withdrawal. The decrease in the extent of cocainism has been noted in Egypt by Russell, who stated in June, 1929, that since heroin has been introduced the use of cocaine for sniffing has almost entirely ceased.

The therapeutic use of cocaine is now virtually negligible, and the drug when used in Europe and in the United States is used for dissipation. Even in this respect the cocaine problem is less complicated than the opium problem. The use of cocaine is not founded upon the traditions of thousands of years as is the use of opium, nor has cocaine ever been surrounded by the same mystery, for its use in Europe and North America did not develop until the present period of scientific knowledge. The control of the problem in these countries is considerably simplified inasmuch as it presents no medical aspects and requires no special provisions for physiologic treatment. Its prevention becomes wholly a matter of controlling the production and distribution of the alkaloid cocaine. The chewing of the leaf is a problem only in certain of the producing countries, notably Peru and Bolivia, where it is a major social problem the solution of which must be found in the social development of the countries concerned.

DRUGS, PUBLIC REGULATION OF. *See* FOOD AND DRUG REGULATION.

DRY FARMING may be defined as the production of crops under such climatic conditions that the yield is usually and primarily limited by low rainfall. The term was first used in certain irrigated districts and other sections of the western United States and Canada, where there was, however, enough rainfall to permit the profitable production of drought resistant crops without irrigation; but dry farming practises are found in all subhumid regions of the world and in some form were known probably to many of the peoples of antiquity.

Dry farming is the final stage in the gradual advance of agriculture on to the grasslands of the world which has been made possible by science and invention. This use for crops first of subhumid and later of semi-arid soils was one of the most significant developments of the nineteenth century and is one that may prove equally significant in the twentieth. When Malthus wrote his famous essay on population in 1798, the prairies and plains of North America had not yet been crossed by white men except for a few fur traders, the steppes of Russia were the grazing grounds of nomads, the pampas of Argentina lay undeveloped and almost unknown, and only a fringe along the coast of Australia had been explored. The agricultural occupation of these grasslands, located mostly in the interior of the continents, was retarded by the lack of water, wood and means of transportation. Well drilling machinery gave water to the almost streamless plains, while the railroads and the steamships brought wood and coal to the settlers and carried back grain, cattle and wool to the cities in

the forested regions fronting on the north Atlantic Ocean. Moreover, the invention of grain harvesting machinery enabled one farmer to do the work of five and increased enormously the area available for profitable cultivation.

The early settlers in Utah, in the Pacific coast valleys, in the interior plateaus and in the great plains area of the United States found themselves handicapped not only by the inapplicability of their methods of tillage to semi-arid land but also by lack of varieties of crop plants adapted to withstand drought. Again and again series of dry years ruined settlers and depopulated the country, particularly in parts of the great plains region. The introduction of drought resistant varieties of crops, principally from Russia and Africa, and the development of such varieties in the United States, have been other important factors in the expansion of agriculture into the semi-arid regions of North America.

The development of dry farming methods, of grain farming machinery and of drought resistant varieties of crops still continues, and the transformation of the grasslands of the world into grain lands consequently is still going on. During the decade from 1920 to 1930 the increase in wheat acreage in the western United States (North Dakota to Texas and west), mostly in the dry farming districts, was nearly 6,000,000 acres; this was accompanied by a decrease of nearly 8,000,000 acres in the states to the east. In western Canada there was an increase of 7,000,000 acres in wheat. In Argentina and likewise in Australia the acreage of wheat increased by about 5,000,000 acres in the decade. In the Soviet Union the wheat area in 1930 was about 40,000,000 acres greater than the average for the years 1921 to 1925 (representing a doubling of acreage), but this earlier period was one of economic disruption and included a season of severe drought. Most of this increase in wheat acreage has occurred in dry farming areas.

The technique of dry farming normally involves the use of special methods to conserve the moisture in the soil, but the distinction from ordinary farm practises under humid conditions in this regard is largely a matter of degree. There is one practise, however, that of summer fallowing, in which the distinction between dry climate farming and humid climate farming is increasing rather than diminishing. Summer fallowing (cultivation of uncropped ground to prevent growth of weeds, allow quick absorption of rainfall and increase available plant food in the soil solution)

has almost ceased among good farmers in humid regions, the fallow having been replaced by intertilled row crops, such as corn, potatoes and roots. But this method of conserving in the soil part of the moisture from the rainfall of two seasons for the use of a single crop is becoming more common in dry farming regions, particularly in regions where intertilled crops are not grown. In those regions where the rainfall occurs in winter and spring it is almost universal.

Fully as important, perhaps, as the conservation of moisture in the soil by cultivation is the use of drought resistant crops and reduction in the rate of seeding so that there will be fewer plants per unit of area. Extensive research into the moisture requirements of plants, drought resistance, soil moisture conditions and similar problems has been carried on in Russia for the past thirty years and in the United States by the experiment stations since 1893, and under the direction of the federal Office of Dryland Agriculture since its organization in 1905. Similar research is also carried on by Canadian, Australian, South African and Indian experiment stations, which results in a greatly increased knowledge of dry farming methods. The principal crops grown in dry farming areas are drought resistant or otherwise adapted varieties of wheat, rye, barley and oats. The high protein or high gluten milling wheat, necessary to modern mechanical baking processes, is a product of the semi-arid regions. Especially in northern latitudes flax is a fair dry farming crop, particularly on freshly broken sod; while in middle latitudes corn is a very important crop, grown mostly for feed; in southern latitudes, where the hot, dry winds interfere with pollination of the corn and often burn up the plants, the grain sorghums (kafir, milo, feterita, etc.) are the safest crops the dry farmer can raise. Many types of cotton also have been discovered to be extraordinarily drought resistant. This crop has become very important in western Texas.

One of the serious problems in dry land farming has been to produce a hay crop, especially a leguminous hay that will help to maintain the fertility of the soil. In the western United States it appears that this need probably will be met in many subhumid areas by sweet clover, but in semi-arid areas this crop has been found to deplete the moisture in the soil. Alfalfa is also an important crop in the subhumid portion of the central plains of North America, and there is some promise in a Siberian alfalfa (*falcata*) for the northern plains. In the semi-arid portions

of the north central plains alfalfa is sometimes grown in rows for seed production. Brome grass is also grown in the more humid portions of the northern plains, and crested wheat grass is promising. But dry farming is characteristically grain farming and seems likely to remain so for many years in the newer regions. The problem of the maintenance of soil fertility in such regions, where there is little or no leaching of the soil, is not as yet a serious problem and probably will not become so within fifty years from the date of settlement.

The development of agricultural machinery has greatly increased the area of dry land crops. The use of machinery in turn has been facilitated by the introduction of non-shattering types of wheat, notably Turkey red and Marquis. When one farmer with the aid of his son for a few weeks can plow and seed and, more recently with the coming of the combine, can harvest 1000 or even 2000 acres of grain, it is obvious that much drier land (with the lower crop yields) can be cultivated with profit than is possible when only about four acres can be hoed by hand in the time permitted by the progress of the seasons, as is the case along the semi-arid margin of settlement in northern China. If in each case the yield is eight bushels per acre after seed is reserved, the Chinese farmer will have only thirty-two bushels, which is scarcely more than enough to feed two persons a year, whereas the other farmer may have 16,000 bushels of grain. Dry farming is better adapted to the use of mechanical power and large scale machinery than any other type of agriculture, because physical limitations—muddy soil, hills and so on—are fewer in such regions and because weather interference with field work is relatively low. Surveys made by the Montana Experiment Station indicate that at the present time on large land units of about 3000 acres with the use of the largest practicable tractors wheat can be produced under the summer fallow system with less than one man hour of work per acre.

The use of the tractor and combine in the dry farming regions of the world is scarcely more than well begun. The question arises therefore as to how much dry farming land exists to be put in wheat and other small grain as a consequence of this mechanization of agriculture. To answer this question even very roughly requires an agreement as to the physical boundaries of dry farming areas. It has been customary to associate dry farming limits with a certain amount of precipitation (rain, snow and hail). But in the

central part of the state of Washington the arid margin is now about ten inches of precipitation, and it would probably move on to eight inches should the price of wheat in that area ever again reach \$1.00 and remain at this point or higher for several years. On the other hand, in southwestern Texas, where the evaporation is much greater and the seasonal distribution of the rainfall less favorable, almost no wheat is grown where the annual precipitation is less than twenty inches.

A much better measure of climate in relation to crops is the natural vegetation, and it might be possible to correlate dry farming conditions with short grass vegetation (*Bouteloua*, *Bulbilis*, and plants of similar habits of growth), at least in North America. But along the humid margin of dry farming areas short grass advances into humid territory on clay soils, especially if heavily grazed, while the tall grasses (*Andropogon* and *Agropyron* species principally) advance into the semi-arid territory on sandy soils. Moreover, along the margin between the tall and the short grass the aspect of the vegetation is different in a dry season from what it is in a wet season. The best measure, at least in the temperate zones of the world, is without doubt the soil itself, principally the color and the profile, especially the depth to the layer of lime (or other salt) accumulation. These characteristics are the result of hundreds of years of physical, chemical and biological activity under the climatic conditions, are the same in wet seasons as in dry and can be readily recognized and measured.

A further problem arises, however, in regard to whether dry farming regions should be defined to include or exclude the chernozem, or black earth, belt; in other words, whether the humid margin of a dry farming region should be drawn where deficient precipitation first becomes evident by the lime accumulation layer in the soil, usually noticeable at three to six feet in depth (two to three feet in northwestern Canada), probably the normal depth of penetration of the rains, or whether it should be drawn along the zone where the black earth turns to dark brown and the layer of lime accumulation lies only from twelve to twenty-four inches (in some parts of the world eight to fourteen inches) below the surface. Fifty years ago well informed opinion would have included the black earth soils in the dry farming areas; at the present time the tendency is to restrict the term dry farming to the brown earth region. Yet the possible future of dry farming can be more adequately pictured

from a survey of the available areas of each. The two major areas of these soils are in Russia and in North America.

COMPARATIVE AREAS OF CHERNOZEM AND CHESTNUT BROWN SOILS IN RUSSIA, THE UNITED STATES AND CANADA

(in 1000 acres)

Russia	
Chernozem	482,560
Chestnut brown soils and inferior chernozem	371,942
United States	
Chernozem	177,664
Chestnut brown soils and inferior chernozem	161,088
Canada (prairie provinces)	
Chernozem	64,800
Chestnut brown soils	50,700

Source: Figures for Russia and the United States from Marbut, C. F., "Russia and the United States in the World's Wheat Market" in *Geographical Review*, vol. xxi (1931) 1-12; figures for Canada from estimates for Alberta by F. A. Wyatt, Chief of Provincial Soil Survey; for Manitoba by R. W. Murchie of Manitoba Agricultural College; for Saskatchewan by O. E. Baker.

Not all of this land, however, is suitable for the production of crops by the use of large scale agricultural machinery. In the United States it is probable that because of rough or hilly land surface or other conditions only about 135,000,000 acres in the chernozem belt and 100,000,000 acres in the chestnut brown soils belt are suitable for dry farming. In Canada there are probably 50,000,000 acres in the chernozem belt and possibly 35,000,000 acres in the brown earth belt available for crops. A. H. Joel, head of the Saskatchewan Soil Survey, believes, however, that when the surveys in the prairie provinces are completed these areas will be seen to be approximately equal. In Russia probably a larger proportion of the land is level or rolling and suitable for crop production. In 1924 there were over 60,000,000 acres of crops harvested plus crop failure in the United States portion of the chernozem belt and nearly 40,000,000 acres in the brown earth belt (together about one fourth of the total area in harvested crops in the United States). It seems probable therefore that there still remain in the United States about 75,000,000 acres in the chernozem belt and 60,000,000 acres in the brown earth belt available for crop production. In the Canadian portion of the chernozem belt there were about 16,000,000 acres in crops in 1920 and of the brown earth belt also 16,000,000 acres (about two thirds of the total crop area of Canada). There were probably about 42,000,000 acres in cultivation in both

belts in 1931 and the ratio of increase presumably has been similar in the two belts. There appear to be therefore about 30,000,000 acres still available for crops in the chernozem belt in Canada and possibly 15,000,000 acres in the brown earth belt, although because of the need to summer fallow part of the land not all of this reserve could be used for crops in any one year. In Russia, although most of the European portion of the chernozem and brown earth belts is in crops or summer fallow, there is certainly a vast area in the Asiatic portion not yet so used, probably 100,000,000 acres and possibly much more. It may be as large as the area still available for crops in both the United States and Canada.

There is also a large area of dry farming land not yet used for crops in Argentina, probably 50,000,000, possibly 100,000,000, acres or more, while Griffith Taylor has estimated that Australia has 300,000,000 acres climatically suitable for wheat. Assuming that half of this land in Australia is too rough, stony, sandy or otherwise unsuitable for crop production, there remain 150,000,000 acres of wheat land, mostly of dry farming character, of which only about 24,000,000 acres were in crops (18,000,000 acres in wheat) in 1931. In South Africa there are several, perhaps many, million acres of dry farming land not cropped and in east Africa a large but unknown area. In the Sudan there is probably a still larger area, possibly as large as the dry farming belt in North America or Russia. In India the use of modern agricultural machinery would probably push the arid margin of crop production many miles beyond its present location, and this is doubtless true also in northwestern China, especially in inner Mongolia, while in western Manchuria there are many millions of acres of potential dry farming land. Viewing the world as a whole it seems probable that not half of the potential dry farming land has yet been touched by the plow. But the area not yet plowed is in general drier or poorer than the land now in crops.

The existence of this vast area of land which is still available for crop production is likely to exert an influence upon the development of agriculture in the humid regions. In view of the economies in harvesting introduced by the combine it appears probable that the dry farming regions of the world will continue for some years at least to produce an increasing proportion of the small grain crops of the world and that the production of wheat in humid regions, except where the price is artificially maintained or the

fields are large enough to use the combine efficiently, will be accompanied by economic difficulties for a while.

Farming in the humid regions and also in the irrigated areas has for some decades been trending toward livestock, particularly dairy and poultry production, and toward the even more intensive use of the land for fruits and vegetables. This trend seems destined to continue. Even in dry farming areas livestock production probably will remain of great importance. The cultivation in the United States of over 100,000,000 acres of former grazing land by dry farming methods has not been accompanied by a decrease in production of meat or milk; indeed, in the Canadian portion of the dry farming belt and in some counties in the United States portion there has been a notable increase in livestock products. The acreage of corn greatly exceeds that of wheat in eastern Colorado, while that of corn and oats combined exceeds the acreage of wheat in Montana. Moreover, if a fair crop of corn or oats is secured, the feeding value of an acre is equal to that from several acres of pasture. The production of feed crops, particularly in the dry farming areas of the United States, will doubtless increase; but dairying will probably prove to be better adapted to the black earth than to the brown earth belt.

While the tractor and combine are making more large farms along the arid margin of settlement, the automobile is making and doubtless will continue to make more small farms along the roads that lead into the cities. In open country with a humid climate, which includes most of the farming land of North America and Europe, it seems probable that the competition of grain from the dry farming regions will, unless artificial barriers are interposed, increasingly compel the consolidation of farms into larger units better adapted to the use of large scale machinery. Where consolidation cannot make farms well adapted to such machinery, as in mountainous districts, the alternative to the use of such land for grazing or forests appears to be in many cases the development of a peasant class more or less satisfied with a low standard of living.

The trend in dry farming regions also is toward the consolidation of farms into larger units. This necessity for larger units was felt even in the nineteenth century. The original homestead laws of the United States permitted allotments of 160 acres for agricultural land, but after homesteading reached the great plains region Congress in 1909 changed the size of the allotment to 320

acres. Before the coming of the tractor 500 acres was considered a desirable size for a crop farm in the brown earth belt, but at the present time with the tractor and combine 5000 acres, of which half may be rough or sandy land used for pasture, is probably about the most efficient size. Not only technical progress but economic factors as well are causing the trend toward increasingly large units in the dry farming areas. No other type of farming is so subject to fluctuations in material and financial returns from year to year. The dry farmer must be prepared to meet the vicissitudes of drought and hail and low prices. To do this he must build up a reasonably large reserve. One reason for the rapid consolidation of farms in dry farming areas has been the frequent failures of men who had not built up such reserve funds and the absorption of their lands by their more businesslike or more fortunate neighbors.

Dry farming thus makes necessary a somewhat different type of financial structure from that which has been associated with the more or less stable agriculture of the humid regions. This fact has resulted in the development of a few "corporation farms" and has also fostered in the individual farmer a new attitude toward his financial problems. The emphasis on exactly computed production costs may be expected to result in a more rational analysis of the economic aspects of all forms of agriculture. The most striking experiment in large scale farming which has accompanied the development of dry farming methods is that of the Soviet Union, where large areas of grassland have been brought under cultivation by state farms operating as vast units.

Extensive farming of this type in areas where crop production has already developed means a decline in the population. In new dry farming areas the population, having been previously dependent on grazing, is sparse and scattered; consequently, the development of crop farming commonly causes an increase in population. But in older agricultural areas the enlargement and consolidation of farms is resulting in marked changes in the character of the rural community. Trucks and automobiles, which make it possible for the farmer to live at some distance from his land, have helped to bring many families into villages and towns where school facilities are better and cultural opportunities greater. In some counties not only the foreign population but also the rural non-farm and urban population is declining. In parts of Kansas and Montana the migration of population has been so great as to result

in the closing of large numbers of rural schools. It is impossible to foresee how far this development may go, but it is interesting to note that the decline of population in rural districts, where the birth rate normally is high, and its increase in the cities, where it is much lower, as well as the rapid decline in the birth rate both rural and urban are resulting in the early approach of a stationary or declining population in the United States. Quite likely lack of demand will soon set an effective limit to the expansion of the dry farming areas, unless the peoples of southern Europe and the Orient should greatly increase their ability to pay for the grain they need.

H., "Agriculture in Semi-arid Lands" in *World Agriculture*, vol. v (1925) 361-63, 371-72; Leppan, H. D., *The Agricultural Development of Arid and Semi-arid Regions* (Johannesburg 1928).

DRYDEN, JOHN (1631-1700), English man of letters and political satirist. Dryden was born of Puritan antecedents, and his first considerable poem, *Heroic Stanzas* (1659), was an elegy on Oliver Cromwell. Eighteen months later, however, in *Astraea redux* (London 1660) he was celebrating the Restoration of Charles II. Confronted with the necessity of earning a livelihood he began in 1663 to devote his energies to the drama, which was reviving after the Puritan eclipse. Although his plays seldom rise above the conventions and sentiments of contemporary tragedy and comedy they developed considerably his skill in the use of the rhymed couplet as well as his powers of satiric characterization. His *Of Dramatick Poesie, an Essay*, which appeared in 1668, established his fame as a critic and as the writer of a new kind of prose—terse, muscular and restrained—which was to be the model for the ensuing century. His appointment as poet laureate in 1670 was an official recognition of his preeminence among literary figures of the time. Throughout his career as a writer Dryden did not cease to interest himself in the political and religious controversies of the period. So far as any coherent political theory can be attributed to him he must be regarded as sharing the belief of Hobbes—and the Vicar of Bray—in the de facto government. An oppor-

tunist rather than a theorist, he carefully adjusted his opinions to his interests. Following the outbreak of the Dutch war he had at the government's instigation turned his hand to propaganda, and during the alarm over the Popish Plot he did not hesitate to stimulate anti-Popish hatred. In 1681, however, he accepted a commission from the court to wield his pen against Shaftesbury, who was awaiting trial on charges of political treason, and his clique of anti-Catholic Whigs. Dryden responded with *Absalom and Achitophel* (London 1681), a poem which ranks among the most bitter and brilliant of political satires. It consists of a series of characterizations strung together on the thread of the Bible story. The two most famous characterizations are those of Achitophel (Shaftesbury) and Zimri (Buckingham), the chief corrupters of the young prince, Absalom (Monmouth). The effect of the poem was tremendous and Dryden followed it with *The Medal* (London 1682), a satire ridiculing the medal in celebration of Shaftesbury's acquittal. The most caustic of Dryden's satires, *Mac Flecknoe*, is directed against the literary spokesman of the Whigs, Thomas Shadwell. In addition to his political satires Dryden wrote two poems dealing exclusively with religious controversy. In *Religio laici* (London 1682) he presents a reasoned defense of the Church of England; but on the accession of James II his elastic genius rendered him sensitive to the advantages of the Catholic faith, and after his conversion in 1686 he wrote on its behalf the poetic allegory, *The Hind and the Panther* (London 1687). When William III ascended the throne, Dryden, deprived of all his emoluments, returned to his purely literary work.

P., *Political Thought from Bacon to Halifax* (London 1914) p. 172-80; Collins, J. C., *Essays and Studies* (London 1895) p. 1-90.

DUAL CITIZENSHIP, or dual nationality, is the condition under which a person possesses the nationalities of two independent states. The terms nationality and citizenship are used interchangeably in this article. Generally speaking, acquisition and loss of nationality are governed by municipal law except in so far as they have been the subject of international agreements. There is no rule of international law which pro-

hibits a state from conferring its nationality upon a person merely because he happens to possess the nationality of another state. A person may be claimed as a national by two, three or even more states, depending on the circumstances of his birth, descent, residence and the like.

While cases of triple nationality are relatively rare, cases of dual nationality are very numerous and arise from three principal situations.

(1) A child born in a country other than that of which his parents are nationals may possess the nationality of his parents under the *jus sanguinis* and the nationality of the country of birth under the *jus soli*. The problem of dual nationality is complicated by the fact that certain states whose laws of nationality are based upon *jus soli* have engrafted upon them to a greater or less extent the rules of *jus sanguinis* and vice versa. The United States has adopted both the *jus soli* and the *jus sanguinis*. The Venezuelan law has also adopted both rules (art. 28, constitution of 1929). A child born in either country of a father who is a national of the other would consequently acquire both American and Venezuelan nationality. (2) A national of one state naturalized in another may find that under the law of the former state he has not lost the nationality thereof. As the United States is committed to the doctrine of the "right of expatriation" it takes the position that foreign governments cannot rightfully assert their claims to the allegiance of their nationals who have lawfully and in good faith obtained naturalization in the United States. It cannot deny, however, that such persons have the legal status of nationals of their states of origin if they have failed to comply with the requirements of such states concerning expatriation. It can only contend that from the standpoint of natural human rights dual citizenship should not result in such cases. (3) In the case of a woman of one nationality married to a man of another the law of her state may provide for the retention of her nationality while the law of her husband's state may confer upon her the nationality of that state. This would be the case if an American woman should marry a German national.

The laws of a number of states which provide for the acquisition of nationality under both *jus soli* and *jus sanguinis* contain conditions which reduce the number of cases of dual nationality. Others provide for the termination of such dual nationality by the individual after attainment of the age of majority; this is the case in Denmark, Norway and Sweden, Great Britain and the sev-

eral British dominions, France, Brazil and several other Latin American countries.

It has been said, even occasionally by the United States Department of State (Moore, J. B., *Digest of International Law*, vol. iii, p. 546-51), that a person born with dual nationality and residing in the foreign country of which he is a national must upon attaining majority elect the nationality which he wishes to preserve and if he elects American nationality must take up residence in the United States within a reasonable time. Such statements, however, are justifiable only in so far as they relate to protection as distinguished from legal status. It is not a rule of international law or of the common law that dual nationality may be terminated by election, whether express or implied from residence or other facts.

The existence of dual nationality in cases of naturalized persons is prevented to a considerable extent by provisions under which the nationality of the country of origin is lost through naturalization in another country. Such provisions appear in the laws of many countries, including not only countries of the western hemisphere and members of the British Commonwealth of Nations but a number of continental European countries. The laws of some countries (such as the Belgian law of May 15, 1922, art. 18), provide that a woman marrying an alien does not lose her original nationality unless she acquires the nationality of her husband under the law of his country. On the other hand, the law of China (law of February 5, 1929, art. 2) provides that an alien woman does not acquire Chinese nationality through marriage unless she loses her foreign nationality under the law of her country.

As a general rule, neither of the two states of which a person has nationality can undertake to protect him while he is within the territory of the other state. A rule to this effect is contained in article 4 of the *Convention on Certain Questions Relating to the Conflict of Nationality Laws* adopted by the Conference for the Codification of International Law held at The Hague in 1930. Whether exceptions may properly be made is an open question. Perhaps they may if the individual is subjected to outrageous or inhumane treatment or discriminated against because of his connection with the state whose protection is sought. In a number of cases it has been held by arbitral tribunals that one of two states of which a person is a national cannot properly bring a diplomatic claim against the other.

Since nationality implies allegiance to a state, dual nationality is essentially an incongruity. A person, whatever his legal condition may be, can hardly entertain a genuine moral allegiance to two states at the same time. Moreover, the existence of dual nationality frequently causes hardship and inconvenience, especially through double taxation and double military obligations. During the World War numerous persons suffered hardships as a result of having the nationality of two countries, sometimes of two countries at war with each other. They were subject to compulsory military service in either of the two countries in which they happened to be and in some cases their property was seized because they had enemy nationality, although they also were nationals of the country where the property was seized (*Kramer v. Attorney General*, L. R., Appeal Cases, 1923, p. 528).

Naturalized citizens of the United States who have not lost the nationality of the countries from which they came frequently receive from the authorities of those countries in time of peace as well as in time of war calls to perform military service or to pay taxes in lieu thereof. In some cases their parents are required to pay the taxes in their stead. If such persons visit their native lands they are liable to arrest and impressment into the army. To some extent this situation has been ameliorated by the conclusion of naturalization conventions, (see EXPATRIATION), but the United States has been unable to conclude treaties of this kind with a number of European countries.

Persons born in the United States of alien parents have also been impressed into the armies of the countries from which their parents came, when temporarily visiting such countries, or have been compelled to pay military taxes. A joint resolution of Congress of May 28, 1928, requested the President to endeavor to conclude agreements with foreign governments, allowing persons born with dual nationality as well as persons naturalized in the United States to visit the other countries claiming them as nationals without their being held for military service or any other obligation of allegiance (45 Stat., pt. 1, 789). Special conventions applicable to persons born with dual nationality were signed with Norway on November 1, 1930, and with Albania on January 21, 1931.

The problem of dual nationality was included in the topics submitted for consideration by the Conference for the Codification of International Law which met at The Hague in 1930. In view

of the great divergences between the laws of many countries no serious effort was made at the conference to formulate a single, uniform rule for acquisition of nationality at birth, and the rule which was adopted for termination of one nationality in cases of dual nationality (art. 6 of the above convention) was so limited as to be of little practical value. Nevertheless, a *Protocol Relating to Military Obligations in Certain Cases of Double Nationality* was adopted, which if ratified by the required number of states will serve to remove to a great extent the inconveniences and hardships resulting from the condition of dual nationality.

DUAL UNIONISM. Dual or rival unions arise by the secession of a part of the workers from an existing trade union or by the founding of a new dual union by groups of unorganized workers or not infrequently by a combination of the two procedures. The concept of dual unionism as a harmful phenomenon arises out of the notion that in a given craft or industry and therefore in the general trade union movement the existence of more than one union within the jurisdiction or orbit hampers the possibility of effective, powerful action. Although dual unions exist elsewhere this attitude and in fact the term

dual unionism itself are of American origin and became current in conflicts arising in the 1890's. At that time there functioned three distinct types of unionism. The first was the indigenous trade union movement which had sprung up prior to the Civil War and which reached its culmination in the eighties in the "general" labor unionism of the Knights of Labor. This movement was anticapitalistic from a middle class point of view, demanding the abolition of the wage system and its replacement not by a socialist order but by a return to the handicraft system and independent self-employment. The second type was "pure and simple craft unionism" set up by the immigrants from the British Isles, of whom the Irish were numerically preponderant but whose leadership was English. This group considered that the achievement of its ends was possible within the framework of capitalism and formed a rival national federation of trade unions in 1881, which was the basis of the American Federation of Labor. The third type was that represented by the class conscious unionism of the continental European immigrants under the leadership particularly of the German anarchists and socialists. In spite of the essential difference in outlook and the isolation due to language differences, this group because of its philosophy of class solidarity as well as its urge for proselytizing threw in its lot with both the English speaking unions. Encouraged by its growth, this group determined to commit both organizations to its doctrines but was outmanoeuvred. Conflict between the other two groups resulted in the nineties in the victory of the Federation, whose leadership particularly stressed the dangers of dualism, pointing out the absence of rival unionism in the British movement as the cause of the latter's strength. The third or class conscious group which was operating within the Federation was then split in two over the question of tactics and policy. The more moderate of the radicals urged the policy of boring from within and condemned as destructive of class solidarity the policy of forming rival unions advocated by the more extreme group. This condemnatory attitude reenforced the attitude of the Federation leaders, who now added radicalism to the undesirable features of rival unionism.

A definitely radical and ideological dual unionism has existed through the sporadic appearance of various organizations. The first was the Socialist Trade and Labor Alliance formed in 1895 under the leadership of Daniel DeLeon, which never became a power because the moderate

radicals who believe in boring from within controlled the largest proportion of union membership. In 1898 the native born elements in the western regions founded the Western Labor Union and in renaming it the American Labor Union implied their intention of making it nation wide. This group furnished some of the impetus for the foundation in 1905 of the Industrial Workers of the World, which was intended to unite and for a brief time did unite all radical elements; but certain leaders returned to the fold of the moderate socialist movement and others participated in the forming of what later became known as the Workers' International Industrial Union, a purely propaganda association which went out of existence in 1918. The I. W. W. in its meteoric rise from 1907 to 1914 and until its swift decline after the war due to wartime persecution, communist incursions and internal strife constituted a definite dual union movement in essence, even though its constituency was made up of the hitherto unorganized elements: the unorganized immigrant workers of the east and middle west, the native born southern workers and the migratory workers of the south. The I. W. W. still exists as a propaganda organization of comparative unimportance, having a dues paying membership only 1 percent of that reported for the Federation. The communist unions, after several unsuccessful attempts in the post-war period, have now gained the challenging position formerly held by the I. W. W. After their policy of boring from within had resulted in expulsions, the communists turned to dual unionism as represented in a national federation by the Trade Union Unity League. The actual membership of its affiliated unions is perhaps not larger than that of the I. W. W., but it has conducted spectacular strikes in the textile, automobile and shoe industries.

In point of fact, however, dual unionism which was not based on ideological differences but which was merely opportunistic was then and still is a common phenomenon of American unionism. It springs out of such causes as quarrels between leaders, revolts against autocratic leadership, differences of immediate policy because of the neglect of groups of workers within their jurisdictions by existing unions or because of jurisdictional disputes or because of the desire of craft unions to persist in an industry controlled in the main by an industrial union. This type of dual union is not based necessarily on a more radical ideology than its rival. At the present time the most powerful of these opportunistic

dual unions, which for one reason or another have been outlawed or refused recognition by the Federation, exist in the clothing, shoe, textile, transport and food industries.

The independent railroad brotherhoods cannot be considered dual unions since the Federation has not organized rival groups in the field. Company unionism, which enrolls 1,500,000 workers, is not dual unionism—not only because of the nature of its sponsorship but also because it is restricted to individual plants. The only important "yellow" union on a craft or industrial basis is the Loyal Legion of Loggers and Lumbermen.

Dual unionism in Germany developed far differently and is almost entirely ideological in basis. The dominant and most powerful type is the "free" or socialist unions. Partly because of priority in time they became firmly established with the masses. A rival grouping was set up by the Christian bodies in 1892 under the influence of the encyclical of Pope Leo XIII in an endeavor to win back from the atheistic leadership of the socialist unions those Catholic and Protestant members over whom these Christian organizations had previously lost their influence because of their original procapitalistic leanings. In contrast, the British labor movement never required a split on religious groupings, for its leadership had never embraced atheism and the nonconformist church leaders in particular had always espoused the workers' cause. This Christian group now has a numerical strength of about 720,000. The third grouping was that known as the Hirsch-Duncker unions organized by liberals who objected to the anticapitalistic bias of the socialists and the religious character of the Christian labor unions. The anarchists and syndicalists have also organized their own unions; and since the war the communists have also begun to organize theirs, although some of them are still boring from within. "Yellow" unionism introduced by the employers in the heavy industries to counteract the other types is ostensibly independent but actually subservient to the employers.

The statement has been made that despite these marked divisions within the same jurisdictions dual unionism in Europe has not had disastrous effects in the industrial field because of the high degree of trade union organization and the solidarity among the workers both during periods of strikes and in wage negotiations; whereas in the United States, where 85 percent of the workers are unorganized and even those

who are unionized lack class consciousness, dual unionism if carried to the same extent would result in wiping out group action by the workers. But even in the United States it is only infrequently that rival unions come into serious conflict in the same jurisdiction. Such unions as those of the teamsters, which are confronted by rival organizations in most large cities, secure conditions equally as good as unions that do not have rivals. One of the most successful of American unions, the Amalgamated Clothing Workers' Union, is a dual union which hopelessly outnumbers the "legitimate" Federation organization. While from time to time warfare breaks out, yet if both unions are strong, neither dares risk a decisive battle; skirmishes go on along the frontiers of control afforded by the vast area which is totally unorganized. In France, which had a practically united trade union movement before the war and has a comparatively divided one now, there has as yet been no serious test or disastrous effect from dualism. So long as differences, ideologic or opportunistic, permeate the labor movements of the world, dual unionism is destined to remain a permanent factor.

DUBOIS, GUILLAUME (1656-1723), French statesman. Dubois is a classic instance of the political intriguer and the dynastic diplomat. In an age of unscrupulous rivalry between opposed

princely houses, when the king was the state, Dubois successfully served as diplomat and administrator and received rich rewards in return from his grateful prince. His position as cleric did not limit in any way his choice of means to achieve desired ends. He was the younger son of a physician and studied for orders at the Collège Saint-Michel in Paris. In 1687 he became preceptor to the duke of Chartres, later the duke of Orléans. When the latter became regent of France in 1715, Dubois planned with him the seizure of the throne in the event of the death of the sickly five-year old king. He went secretly to Holland and Hanover, bringing about with Stanhope an alliance between the regent, England and Holland directed against Philip v of Spain (the heir apparent to Louis xv) and the Stuarts. Dubois became the regent's director of affairs, a member of the council for foreign affairs and head of the diplomatic service—all extremely lucrative positions. He secretly sought advance consent of the Emperor Charles vi and even, if possible, of Philip v to the eventual succession of the duke of Orléans to the throne of France. He persuaded the regent to invite the emperor to join the Anglo-Hanoverian-Dutch alliance which declared war against Spain in 1718. By August, 1718, France had become accustomed to the absolute authority of the regent, and Dubois was made minister for foreign affairs. In 1720 he became archbishop of Cambrai.

As the young king's health became more robust, the comptroller and the Scotch banker Law plotted with the princes of the blood and with Spain against Dubois' scheme. With the help of the English Dubois brought about Law's downfall and discredited his system. By exploiting the ambitions of Elizabeth Farnese, the queen of Spain, he succeeded in forming a Franco-Spanish Alliance (1721), and he persuaded England to join in opposition to Austria should it oppose the establishment of a third branch of the Bourbons in Italy. Diplomatic marriages now made undisputable the regent's authority and Dubois became cardinal.

In August, 1722, Dubois persuaded the regent to reestablish the office of prime minister and to make him successor to Richelieu and Mazarin. A few months later he died.

ÉMILE BOURGEOIS

Consult: Capefigue, J. B., *Le cardinal Dubois* (Paris 1861); Wiesener, L., *Le régent, l'abbé Dubois et les anglais*, 3 vols. (Paris 1891-99); Bourgeois, É., *La diplomatie secrète au XVIII^e siècle*, 3 vols. (Paris 1909-10).

DUBOIS, PIERRE (1250?-1322?), French publicist and political theorist. He was the author of several pamphlets, most of which were written in support of Philip the Fair during his controversies with the papacy and Knights Templars. His important ideas are summarized in his chief work, *De recuperatione terre sancte* (c. 1306; ed. by C. V. Langlois, Paris 1891). Ostensibly a plea for a crusade against the Saracens, it served as the vehicle through which he urged a number of far reaching reforms. Peace among Christian princes was, he held, not only a necessary preliminary to the crusade but was also essential to the promotion of human welfare and culture. To put an end to the incessant feudal wars a European league should be established, composed of nobles and prelates of every rank, with an economic boycott as well as armed force as a means of coercing anyone who ventured upon war. Controversies between sovereign princes were to be settled by an international court of nine judges. Each party to the controversy was to choose three judges. The remaining three were to be prelates chosen by a board of arbitration set up by a council of princes and prelates.

Under the guise of a program of education for those going to the Holy Land Dubois advocated a complete school system ranging from the elementary to the professional, for the training of both girls and boys. The value of practical experience as opposed to purely theoretical education was emphasized and the proposed curriculum stressed modern languages, the natural sciences and mathematics.

For the reform of the church he proposed the secularization of its property, the abolition of clerical celibacy and strict limitation of monasteries. Within France he urged military and financial changes and the simplification of legal procedure. His chauvinism is very obvious in his demand that the Holy Roman Empire and the papal states be placed under the jurisdiction of the French monarch.

Dubois is typical of the numerous publicists and pamphleteers of the period who sought to further the cause of the rising monarchies against the papacy. Although he originated some reform schemes he is primarily significant for his presentation in unified form of the ideas which were current among the intellectuals of his day.

WALTHER I. BRANDT

Consult: Zeck, Ernst, *Der Publizist Pierre Dubois* (Berlin 1911); Brandt, Walther I., "Pierre Dubois:

Modern or Medieval?" in *American Historical Review*, vol. xxxv (1929-30) 507-21; Renan, Ernest, "Pierre Dubois, légiste" in *Histoire littéraire de la France*, vol. xxvi (Paris 1873) p. 471-536.

DUBOS, JEAN BAPTISTE (1670-1742), French historian and art critic. Dubos was born at Beauvais of a family of the *noblesse de robe*. He studied theology and was active in various diplomatic missions. His reputation as a historian rests chiefly on his *Histoire critique de l'établissement de la monarchie françoise dans les Gaules* (3 vols., Paris 1734; 2nd ed., 4 vols., Paris 1742). As a typical representative of the bourgeoisie allied with the royal power he combated the feudal and aristocratic ideas of Boulainvilliers and first formulated the Romanist theory of French origins. His thesis is that there never was a Frankish conquest, that the Franks came to Gaul as allies of the Romans without modifying the political and administrative regime of the country, that feudalism established itself four centuries later by the dismemberment of the sovereignty and the transformation of public offices into seigniories and that consequently the traditional government of France is a pure monarchy and not a monarchy with a feudal base founded upon conquest. Combated by Montesquieu, Dubos' historical ideas were later espoused in part by Savigny and more especially by Fustel de Coulanges.

As an art critic Dubos was the precursor of Taine in his formulation of the doctrine of *milieu* as the basis of literary criticism, and his *Réflexions critiques sur la poésie et sur la peinture* (2 vols., Paris 1719, 7th ed. 3 vols., 1770; tr. by Thomas Nugent, 3 vols., London 1748) put an end to the quarrel between ancients and moderns by its criticism of the thesis of the former that the perfection of ancient art constitutes the sole criterion for us, and of the latter that there is such a thing as indefinite progress.

RENÉ HUBERT

Consult: Lombard, A., *L'abbé Du Bos, un initiateur de la pensée moderne* (Paris 1913).

DU CANE, SIR EDMUND FREDERICK (1830-1903), English prison administrator and reformer. He was born in Colchester, educated at the Royal Military Academy, Woolwich, and then entered the Royal Engineers, eventually reaching the rank of major general. His experience with penal administration began in 1851, when he organized the convict labor employed on public works in western Australia. In

1863 he became director of convict prisons in England and surveyor general of prisons. He was appointed chairman of the prison commissioners in 1877 and was the dominating force in English prison administration until his retirement in 1895.

Prior to 1877 English prisons were provided by local authorities, and every county and almost every municipal corporation had its own prison. The jail was essentially a place of detention rather than of punishment. It was run by the jailer on a profit making basis, which inevitably produced appalling abuses. The local justices of the peace nominally possessed powers of supervision but in practise ignored the prisons.

In 1873 Du Cane submitted to the home secretary a scheme for the complete centralization of the prisons. This was embodied in the Prisons Act of 1877, which at one stroke transferred to the home secretary all the prisons of the country. On no other occasion in English history has a great administrative service, extending throughout the country, been transferred en bloc from the local authorities to the central government. Almost immediately the prisons were greatly reduced in number. Du Cane then proceeded to impress upon the prison system economy, repression and uniformity. Expenditure was rigorously cut down to an extent which now appears excessive. The repression of crime was attempted by the most severe methods of deterrence, including the cellular confinement of the prisoner during the whole term of his sentence. Uniformity was introduced to an almost fanatical degree in diet and a system of education, accounting and hard labor on the treadmill. Du Cane improved the prison buildings, reduced the cost of maintenance, coordinated the staff, introduced the employment of prisoners on useful work and established the first registration of criminals. He was responsible for the idea of encouraging good conduct by "progressive stages" of leniency. He reduced the suicide rate among prisoners. The defects of the Du Cane regime were its excessive centralization and wooden uniformity, the sacrifice of human interests to undue economy and repression, the lack of attention to the problems of feeble-mindedness and after care and a tendency to regard prisoners as a hopeless or worthless element in the community. A conscious departure from much of Du Cane's doctrine was made immediately after his resignation in 1895.

WILLIAM A. ROBSON

Crime (London 1885); Introduction to a report, *Results of Censuses of the Population of Convict Prisons in England*, by William A. Guy (London 1875); *Report on the Discipline and Management of Military Prisons 1874 and 1875*, Great Britain, Parliament, Accounts and Papers, vol. xxxvi (1876) p. 505-79.

Consult: Webb, Sidney and Beatrice, "English Prisons under Local Government" in their *English Local Government*, 9 vols. (London 1906-29) vol. vi, ch. xii; Ruggles-Brise, E., *The English Prison System* (London 1921).

DU CANGE, CHARLES DU FRESNE, SIEUR (1610-88), French historian. Du Cange had a peaceful administrative career as treasurer of France in Amiens, his native city. He employed his leisure time in reading with pen in hand the Latin, Greek and French authors of the Middle Ages, and he was almost fifty when it occurred to him to publish the substance of the copious notes he had thus gathered upon the most diverse subjects. His *Glossarium ad scriptores mediae et infimae latinitatis* (3 vols., Paris 1678; new eds. by G. A. L. Henschel, 7 vols., Paris 1840-50, and by Léopold Favre, 10 vols., Niort 1883-87) is a vast catalogue, in the alphabetical order of the Latin words chosen to designate them, of mediaeval institutions, manners and customs in western Europe. An enormous mass of texts, which form the basis for an administrative, social and economic history of the Middle Ages, is classified and interpreted with rare sagacity and the work is still the *vade mecum* of mediaevalists.

Du Cange followed the Latin glossary with a smaller volume of the same nature for Byzantine history, the *Glossarium mediae et infimae graecitatis* (2 vols., Lyons 1688). Although much briefer it represents the beginnings of modern scientific investigation of Byzantine history and is for the present the only dictionary available for the study of Greek civilization in the Middle Ages.

DUCHESNE, LOUIS MARIE OLIVIER (1843-1922), French church historian. Duchesne was born in Brittany and after completing the usual professional ecclesiastical studies devoted himself to the study of Christian archaeology and of church history. He taught in the Institut Catholique in Paris from 1877 to

1895 and in the *École Pratique des Hautes Études* from 1885 to 1895 and was head of the *École Française* in Rome from 1895 to 1922. Through his activity as a teacher and through the *Bulletin critique*, which he founded in 1880, as well as through his numerous writings, Duchesne's influence was considerable, almost unique, in the revival of the study of ecclesiastical history in France. While he contributed indirectly to the modernist movement in the Roman Catholic church Duchesne was never personally associated with the movement and foresaw its failure. He regarded traditional dogma as beyond change and did not believe that the church, even if it were willing, could modify or correct its interpretations without destroying itself. His works were impregnated with the scientific spirit, yet they were from the beginning regarded with suspicion by the official guardians of orthodoxy. His reputation as a scholar saved him from censure under Leo XIII. Under Pius x his *Histoire ancienne de l'église* was placed on the Index. He submitted to this reproach as a matter of discipline and was in a measure restored to favor under Benedict xv. His work was that of a scholar, not of a theologian or apologist; the church resisted it, but without destroying or even seriously interfering with it.

A. LOISY

Chief works: *Étude sur le liber pontificalis* (Paris 1877); *Origines du culte chrétien* (Paris 1889, 5th ed. 1910), tr. from 3rd ed. by M. L. McClure (5th ed. London 1919); *Fastes épiscopaux de l'ancienne Gaule*, 2 vols. (Paris 1894-99; 2nd ed., 3 vols., 1907-15); *Histoire ancienne de l'église*, 3 vols. (Paris 1906-08, 5th ed. 1911), tr. from 4th ed. (London 1909-24).

DUCPÉTIAUX, ÉDOUARD (1804-68), Belgian social statistician and reformer. Early noted for a university dissertation against capital punishment, Ducpétiaux was rewarded for his share in the revolution of 1830 by the post of inspector general of prisons and charitable institutions, a position which he held for over thirty years. His administrative successes included agricultural reform schools for young vagrants and the improvement of the free colony for the insane at Gheel. In penology Ducpétiaux stood for the system of cell as against congregate confinement and under his influence the leading prisons of Belgium were erected into cell block

structures. He saw the practical suspension of capital punishment in his country, agitated for indeterminate sentence, probation and prisoners' aid societies and initiated a series of international prison and charitable congresses.

Ducpétiaux wrote voluminously in the field of social statistics and persuaded the government to publish regular decennial censuses of charities and corrections. He served as the compiler of Belgium's first official cost of living survey published in 1855, which had been planned by Quételet and other members of the Central Statistical Commission. Ducpétiaux showed that nearly one third of the families reported were in receipt of relief in some form and that the quantity food budget of the typical worker was decidedly poorer than that of the soldier and sailor and even worse than that of the convict. Ducpétiaux appealed here as elsewhere for the abandonment of *laissez faire* and for the establishment of permanent commissions of inquiry, national and international.

DUE PROCESS OF LAW. The concept of due process of law traces its lineage far back into the Middle Ages. In a feudal decree of Conrad II, one of the strongest of the Holy Roman emperors, we find the statement: "No man shall be deprived of his fief . . . but by the laws of the Empire and the judgment of his peers" (decree of May 28, 1037, in Stubbs, W., *Germany in the Early Middle Ages*, 476-1250, ed. by A. Hassall, London 1908, p. 146-

47). Nearly two hundred years later the same guaranty is elaborated and stressed in the famous thirty-ninth chapter of Magna Carta which reads: "No freeman shall be taken and imprisoned or disseised or exiled or in any way destroyed, nor will we go upon him nor send upon him, except by the lawful judgment of his peers and by the law of the land." Magna Carta, viewed from the beginning as a permanent charter of English civil liberty, was confirmed by succeeding sovereigns, and it is in one of these confirmations that the phrase due process of law first appears. In a statute of 1354 we read: "That no man of what estate or condition that he be, shall be put out of land or tenement, nor taken, nor imprisoned, nor disinherited, nor put to death, without being brought in answer by due process of the law" (28 Ed. III, c. 3, known as Statute of Westminster of the Liberties of London). None of these documents explained what was meant by the law of the land, or due process of law, but we have the authority of Sir Edward Coke that the two phrases meant the same. In American law they have always been held synonymous.

The concept of due process of law, or the law of the land, came to America as an important part of the rights of Englishmen, tenaciously claimed by the colonists. The not infrequent use of, or paraphrase of, the term law of the land in colonial charters and constitutional documents proves the importance attached to it by the American colonists. The phrase appears in the Virginia Declaration of Rights of June 12, 1776, and in varied forms in the revolutionary constitutions of several other states. It did not appear in the Constitution of the United States as originally adopted, but the Fifth Amendment contains the classic statement that "no person shall . . . be deprived of life, liberty, or property without due process of law," the first use of the phrase due process of law in an American constitution. At the present time there are only five of the United States which do not have in their constitutions either a due process clause or a close equivalent: Indiana, Kansas, New Jersey, Ohio, Oregon. Of these New Jersey is the only one which does not have a clause somewhat similar in import to due process of law. In 1868 the Fourteenth Amendment borrowed the phraseology of the Fifth Amendment in a due process clause applicable to the states. The courts have held the two clauses to be identical in meaning.

The evolution of the judicial interpretation of due process of law by American courts has been of tremendous interest and importance. Whatever its meaning in English legal history may have been (and upon this point students differ), there can be little question that due process of law in America was for nearly a century interpreted as a procedural restriction. It concerned itself not with what the government was doing but with how it was doing it. Thus it applied directly to the machinery or procedure by which persons were tried for crime, by which property rights were adjudicated, by which the powers of eminent domain and taxation were exercised. But it was not deemed to have any bearing upon the actual substance of the law. It is true that in the Dred Scott Decision in 1857 Chief Justice Taney declared that the Missouri Compromise Act of 1820, by depriving persons of their liberty or property (in slaves) merely because they moved into certain territory, "could hardly be dignified with the name of due process of law" (Dred Scott v. Sandford, 60 U. S. 393, 450). And in 1856 the New York court held that a prohibition statute which authorized the summary destruction of liquor already on hand amounted to a deprivation of property without due process of law (*Wynehamer v. People*, 13 N. Y. 378). These two judicial utterances, however, stand out alone from the great body of American decisions prior to the middle eighties.

There is no evidence that the inclusion of due process of law in the Fourteenth Amendment as a limitation on the states was intended to establish any new principles of civil liberty. In the early cases interpreting that amendment the Supreme Court gave the due process clause its traditional construction as a protection to procedural rights. In the Slaughterhouse cases (83 U. S. 36) in 1873, involving the validity of the New Orleans butcher shop monopoly, the due process clause was held to be wholly inapplicable. In *Munn v. Illinois* (94 U. S. 113) in 1877 the court refused to regard due process as a restriction upon the power to fix public utility rates. But impelling forces were to broaden the judicial interpretation of due process and transform it into our most important constitutional restriction upon the substance of legislation. The close of the Civil War ushered in a social and economic revolution marked by the growth of interstate markets through increased railroad facilities, the development of large scale production made possible

by huge accumulations of capital and the emergence of a fairly well defined laboring class. Out of these far reaching changes came problems both novel and complex with which state legislatures attempted to deal by police regulations and laws for the control of public utilities. Some of these were sound and necessary; others were ill advised, arbitrary and burdensome, and business men affected by these clamored for constitutional protection against what they deemed legislative excesses. Within the vague outlines of the due process clause the courts found the weapon demanded by the new conditions, and after some hesitation they abandoned their earlier views and accepted due process of law as a direct constitutional restraint upon the substance of legislation, a guaranty, moreover, which was applicable not only to natural persons but to corporations. By the late eighties the new judicial attitude had become firmly established.

In applying due process of law as a test of the validity of state police legislation there were no clear precedents to follow and the result was the emergence of the theory that such police regulations deny due process of law if they are arbitrary in character. But since every exercise of the police power involved a restraint upon individual freedom of action or the free use of property based upon some social need which presumably justified the restraint, a law could be said to be arbitrary only if the social necessity or interest it served was not a sufficient justification of the restriction of liberty involved. The judicial balancing of these two vital elements one against the other is in its simplest terms the test of due process as applied to social legislation.

But this leaves a vast field for the play of personal opinions and prejudices. Whether the social need for an employers' liability statute justifies the novel burdens placed upon employers is a question to be answered in the light of one's knowledge of social facts, one's philosophy of law and one's view as to the proper scope of governmental activity. It is not surprising therefore that judges schooled in economic individualism and the doctrine of laissez faire and imbued with the philosophy of natural rights should strike down without compunction laws requiring safety devices, shorter hours for women, regulation of the time and method of wage payment, employers' liability and many similar enactments. Of particular importance in applying due process of law to

protective labor legislation was the doctrine of liberty of contract which emerged in the state courts in the eighties and received its first recognition in the Supreme Court in the case of *Lochner v. New York* (198 U. S. 45) in 1905. By this doctrine liberty to contract freely was made part of the liberty protected by the due process clause. Ignoring the fact that liberty of contract exists only when the contracting parties have substantially equal bargaining power the courts insisted that it could be interfered with only under the most manifest public necessity, and in a typical decision we find the New York Court of Appeals invoking liberty of contract on behalf of the right of an adult woman to work "at any time of the day that suits her" in a case invalidating a statute restricting night work for women [*People v. Williams*, 189 N. Y. 131 (1907)].

The early reactionary decisions under the due process clause were owing in large measure to a wholly natural judicial ignorance of the social and economic problems which the states were attempting to solve. To dispel this ignorance the famous Brandeis briefs were prepared, the first of which was presented in support of the Oregon ten-hour law for women in 1908 in the case of *Muller v. Oregon* (208 U. S. 412). These briefs paid small attention to legal precedents and principles but marshaled a compelling mass of facts showing the social, economic and physiological basis for the legislation under review. The court still had to determine whether these facts justified the restrictions of liberty which the law imposed, but it at least had the real facts before it. The result was that numerous laws for social betterment were held valid which would undoubtedly have been held void without the adequate knowledge of social facts provided by the briefs. After Mr. Brandeis' appointment to the Supreme Court his work on these cases was carried on by Professor Felix Frankfurter. Both lawyers were aided by expert social workers, such as Josephine Clara Goldmark and Mary Williams Dewson of the National Consumers' League.

These liberal decisions did not, however, represent a permanent change in judicial attitude. With the shifting of the court's personnel and with the emergence of new forms of social legislation we have had recently a substantial group of decisions embodying the legal and economic philosophy of the eighties and nineties. The most conspicuous of these is the decision invalidating the District of Columbia

Minimum Wage Law (*Adkins v. Children's Hospital*, 261 U. S. 525) in 1923. The point of view of the majority in this case is identical with that expressed in *Lochner v. New York*, *supra*, which held void the New York ten-hour law for bakers. Of a similar import are *Burns Baking Co. v. Bryan* [264 U. S. 504 (1924)], invalidating the Nebraska regulation of the weight of loaves of bread, and *Weaver v. Palmer Brothers Co.* [270 U. S. 402 (1926)], invalidating the Pennsylvania statute forbidding the use of shoddy in mattresses. The court's philosophy of due process of law has not progressed beyond the point which makes the decision rest upon the personal reactions of the judges to the factual and legal situation involved. A general definition of due process has been consistently refused by the Supreme Court. It has not been willing to adopt the doctrine of Justices Holmes and Brandeis that if the question of the social need for a police regulation may be deemed reasonably debatable by reasonable men the law is within the proper range of legislative discretion even if the judges themselves regard it as objectionable.

There has been an important recent expansion of the meaning of the term liberty in the due process clause of the Fourteenth Amendment. For many years the court had steadily refused to accede to the view that liberty included protection against any arbitrary interference with the "pursuit of happiness" and particularly included the fundamental civil liberties described in the federal Bill of Rights. It reaffirmed this position as late as 1922 in *Prudential Insurance Co. v. Check* (259 U. S. 530). The following year, however, the court held that the right to teach German in a private school was part of the liberty protected by due process of law and in a striking dictum gave to the term liberty a well nigh all inclusive scope. In 1925 the court upheld the New York Criminal Anarchy Act (*Gitlow v. New York*, 268 U. S. 652, 666) against the contention that it denied liberty without due process of law because of its arbitrary impairment of freedom of speech and announced: "For present purposes, we may and do assume that freedom of speech and of the press—which are protected by the First Amendment from abridgment by Congress—are among the fundamental personal rights and 'liberties' protected by the due process clause of the Fourteenth Amendment from impairment by the States." It seems clear that the court is disposed now to include within

the meaning of the term liberty all the fundamental civil guaranties found in the first ten amendments.

As applied to procedure due process requires in criminal cases a fair and orderly trial publicly conducted before a court which has jurisdiction. It assures to the accused his right to be present and to put in his defense. It has been held, however, that it does not guarantee trial by jury, grand jury indictment or protection against self-incrimination. Due process requires, however, that criminal statutes must be sufficiently definite to enable reasonable people to know when they are violating them.

In civil procedure due process requires a fair hearing before a competent tribunal. A fair hearing is not always a hearing before a court but may be before an administrative tribunal, depending upon the character of the rights involved. In taxation and eminent domain the same broad principles apply. There must be essential fairness of procedure appropriate to the nature of the rights affected and the power exercised. The doctrine that taxes may be levied only for public purpose has come to be grounded upon the due process clause, as well as the requirement that under eminent domain private property may be taken only for a public use. The value of the land so taken must be fairly determined and adequate compensation made. Due process requires that taxes be laid only upon persons and property within the taxing jurisdiction; and when the tax levied is upon special properties according to their value, as is true of special assessments, due process requires that the taxpayer be allowed a hearing upon the value assessed.

In the field of public utility regulation the court, departing from its original view expressed in *Munn v. Illinois*, *supra*, has successively held that due process requires that the reasonableness of rates must be judicially reviewable—that the rates be reasonable and that a reasonable rate is one which allows the utility a fair return upon a fair valuation of the property used in the public service. What constitutes a fair return cannot be categorically stated but will vary with the character and risks of the business. Upon the problem of determining the valuation of public utility property experts differ; but the Supreme Court seems to have committed itself to the theory that the value of such property if not actually computed upon the basis of present reproduction cost must at least take that factor very largely into

consideration [St. Louis and O'Fallon Railway Co. v. U. S., 279 U. S. 461 (1929)].

Although there is some dispute among commentators as to whether equal protection of the law is included within the concept of due process, the concept would seem broad enough to afford protection against arbitrary classification as well as against oppressive and arbitrary laws. At any rate the due process clause has been seldom invoked against arbitrary classifications since the equal protection clause is more directly available for that purpose. In *Truax v. Corrigan* [257 U. S. 312 (1921)] Mr. Chief Justice Taft distinguished between the two guaranties by holding that rights were protected by the equality clause which were beyond the reach of due process. On the other hand, there is no specific guaranty of equal protection applicable to the federal government, and yet from the beginning the courts have construed the due process clause of the Fifth Amendment as guaranteeing fundamental equality before the law.

The task of applying the constitutional test of due process of law to modern legislation has enormously strengthened the prestige and power of the American courts and has brought out in sharp relief the unique character of the American doctrine of the judicial review of legislation. In no other field of the law is there so complete an absence of concrete tests and standards, so much room for the exercise of pure discretion by the court. In applying the due process test to police regulations of the control of public utilities the courts constitute a third chamber, marshaling their own views of social and economic policy and legal theory in settling the vague question whether the acts in question are arbitrary or not. American social policy is circumscribed by limits nowhere definitely stated but inhering in the social outlook of the members of the Supreme Court. This outlook while not at all times illiberal has been sufficiently conservative to keep American legislatures from using methods in dealing with certain pressing social problems which are approved by the enlightened experience of the other industrial nations of the world. As Mr. Justice Holmes has trenchantly put it in his dissenting opinion in *Truax v. Corrigan* (1921), *supra*, the concept of due process has frequently been so applied as to "prevent the making of social experiments that are an important part of the community desires, in the insulated chambers afforded by the several States. . ."

On the other hand, the due process clause has been applied to invalidate legislation admittedly oppressive and burdensome in character, and thus it remains a powerful although dimly defined bulwark of individual civil liberty. Like the contract clause it has contributed an element of stability to the economic life of the country by guaranteeing protection against legislative invasion of the vested right of property and business.

DUELING. The duel is a contest with weapons between two individuals who fight to secure satisfaction for personal grievances and in accordance with set regulations. It has several analogues in primitive cultures. Among aboriginal Australians combat is imposed upon a man, usually one who has defied the social regulations by eloping with a woman not, according to group usage, intended to be his wife. In such a case, when the man returns to camp he must allow the relatives of the woman to throw spears at him. He is allowed to defend himself with a shield, and usually at the first drawing of blood the elders, who stand by to insure fair play, intervene and terminate the

contest. Among the Greenland Eskimos, the "nith-song" is a non-material weapon of contest, although one with barbs that penetrate Eskimo sensitiveness. In this contest the injured person challenges his enemy to a duel of song. The disputants hurl witty, abusive and insulting songs at one another until one of the two contestants has exhausted his vituperation. The audience then gives the decision, and the contestants must thereafter be friends. In another form of the Eskimo duel the two men in the presence of others press a pointed bone into each other's cheeks until one shows signs of pain or anger and thereby confesses defeat. Scandinavian influence has been perceived by some in both of these Eskimo customs.

The duel proper is not found in any of the ancient civilizations. Such contests as those between David and Goliath, Achilles and Hector, are duels in form but actually arise from different motives and should be classed as contests of champions. The probable origin of the duel is in the trial by ordeal of the Germanic peoples; it developed out of one of the forms of the ordeal—the judicial combat to determine the guilt or innocence of the accused. If he declared himself innocent he had to fight the accuser in the presence of witnesses, who constituted the jury. The conduct of modern law cases is in large part but a softening of this early Germanic judicial combat, although weapons and procedure have become considerably modified. Although the custom is much older, the ordeal was first legally established in 501 by Gundobald, king of the Burgundians. In 887 Pope Stephen VI prohibited the judicial duel and all forms of the ordeal. In 855 the Council of Valence had issued an edict against dueling, but during the reign of Lothaire duels were frequent, and during the reign of Otto I (936–73) disputes regarding succession were settled by combat. In 1260 Louis IX forbade the duel in the courts of the realm although he allowed it in the courts of the barons. Philip the Fair later in 1306 permitted the judicial duel in charges of felony, treason and violence. In 1547 Henry II of France prohibited duels on French soil and thus terminated the practise of the judicial duel in France. Iceland and Norway forbade the judicial duel early in the eleventh century; and in 1215 during the reign of King John trial by ordeal, including the judicial combat, was abolished in England. In 1818, however, the right to judicial challenge was upheld in England by the court, which declared that

the common law had not been abrogated by act of Parliament; and an accused murderer was dismissed because the brother of the murdered girl refused the gage of battle. Shortly thereafter in 1819 Parliament passed a law abolishing the judicial duel.

In Italy the judicial duel of the Lombards and Goths gave place to the modern form of the duel; and from Italy it crossed the Alps in the latter part of the fifteenth century, having penetrated the armies of Charles VIII in northern Italy. It was given wider prevalence in France as a result of the Italian expeditions of Louis XIII in the sixteenth century. From this time on it was divorced from court procedure and it has since had an independent history. The practise of using seconds (*parrains*, or "godfathers") was introduced from Italy into France in 1578 among the *mignons* of Henry III. These seconds corresponded to the jury of the judicial combat, but in Italy and in France they frequently fought when the principals fought. Later, however, they did in fact endeavor to insure fair play, especially after the "affair of honor" duel had come into greater vogue. In the sixteenth century pistols were introduced as the weapon in English duels, and they remained the favorite weapon in the British Isles. In France, however, the small sword and the saber were preferred, until the English method was introduced into France through military circles in the latter half of the eighteenth century.

During the last four hundred years hundreds of thousands of duels have been fought, although there are only hints of more exact figures for any definite period of time or in any country. During his reign Henry IV granted 14,000 pardons to duelists, and it is estimated that between 1589 and 1607 four thousand gentlemen were killed in affairs of honor in France. The judicial duel was a struggle to the death, and the early non-judicial duels were of a most brutal sort, in which the contestants fought savagely and always one was killed, and often both. The English duel, however, was not synonymous with mortal combat; a study of nearly two hundred English duels showed a mortality of only one in fourteen combatants and injury to one in six. The later affair of honor duel was even less dangerous; in the nineteenth century it was usually terminated when one of the principals was injured, and frequently ended without injury to either of them. A specific phase of the duel of this type is illustrated in the German student duels (*Mensur*), in which

precautions prevent serious injury to the participants and the affair is a regularized fraternity procedure, a channel to esteem, prestige and later professional standing. The duel was prevalent among German students in the seventeenth century and was vigorous in the eighteenth century (article 9 of the 1713 Prussian edict against dueling refers to it). After falling into abeyance the student duel was revived about 1835 and became an important feature of university life, especially in Bonn, Heidelberg and Göttingen. Its vogue in the nineteenth century was largely a revival, stimulated by the romanticism which formed the basis of the nationalistic movement.

The history of dueling in western Europe is thus not without interest from the viewpoint of institutional development. Starting as a judicial device, it was divested of its function by the development of more satisfactory legal machinery. But it was retained by the military groups and consequently by the aristocratic classes as a mark of class differentiation and as part of a code of punctilio. When it became apparent that its use was excessively destructive, its rigor was mitigated, but by a process common in the history of social institutions its forms were retained.

Since the militaristic tradition is an important element, wars have stimulated dueling, especially among officers. Outbreaks of duels became prevalent in France after the revolutions of 1789 and 1830, and in the latter year there was a revival of the duel in Belgium. After 1815 there were many duels between English and French officers. In France during the present century, under the influence of traditionally intense political conflicts, they have been most prevalent among parliamentarians, journalists and authors. In all countries in which the duel has been in vogue many prominent people have been participants or have been involved in challenges: in France Richelieu, La Fontaine and Voltaire; in England Sir Robert Peel, Charles James Fox, the Duke of Wellington; in the United States Henry Phillips, Aaron Burr, Alexander Hamilton, Andrew Jackson, Stephen Decatur, Henry Clay, John Randolph. Abraham Lincoln was challenged to a duel. Gustavus IV challenged Napoleon to a duel, and such action was not without precedent among European crowned heads.

The non-judicial duel was first abolished in the Germanic countries and has been most persistent in the Latin countries. England was

the first major European country to take this step. In Scandinavia, Holland and Germany the duel had practically disappeared before the end of the nineteenth century, but throughout that century duels were frequent in Latin countries, Hungary, Montenegro, Poland and Russia.

In America the duel persisted longer in the southern states than in the north; in the first thirty years of the nineteenth century there was only one duel in the state of New York, whereas they were frequent in Louisiana during the same period. Early in the present century associations to stamp out dueling were organized in all the European countries in which dueling still flourished, and in 1908 an International Anti-Dueling Congress was held at Budapest. Where the laws against dueling have been rigorously and impartially enforced, duels have noticeably decreased; public sentiment has also been an efficient factor. But where duels have persisted despite hostile legislation it has been because duels, like feuds, are part of the conception of personal honor in regard to which the usual sanctions of the law are inoperative.

DUFF, ALEXANDER (1806-78), Scottish missionary. As the first missionary of the church of Scotland in India Duff initiated and developed a system of missionary schools and colleges, in which English was spoken, for the education of higher caste Hindus. In this work

during the years from 1830 to 1863 he was intimately associated with Ram Mohun Roy (1774-1833), the famous Indian social and educational reformer, Sir Charles Trevelyan (1807-86), Lord William Bentinck (1774-1839) and Lord Macaulay (1800-59). Duff was influential also in the foundation and early educational policy of the University of Calcutta. From 1845 to 1849 he was editor of the *Calcutta Review*, and later the first occupant of the chair of foreign missions at New College, Edinburgh.

Duff's work was closely bound up with two great issues, the historical resolution of which he himself profoundly influenced: the relation of missionary preaching to the world of intellectual ideas, and the structure of education in India. He believed in the unity of truth and stood steadfast throughout his life for a conception of missionary work which welcomed education as an ally. This principle, established by Duff, that secular learning is no enemy to sacred things, has been vindicated by the missionary school and college in India and throughout Asia and Africa, in spite of the criticism that missionary education is too literary and insufficiently related to economic and cultural needs (charges which are now less true of it than of the educational systems surrounding it). He argued, moreover, in opposition to the "Orientalist" group in Calcutta, that the only way that modern western learning and thought could be conveyed to India was through the English language rather than by Sanskrit, Arabic or Persian. From this decision is derived much that is important in modern India, for English became the common language of educated Indians and so made possible the growth of an all India feeling, while the liberal ideas enshrined in English literature powerfully fostered the growth of Indian nationalism.

WILLIAM PATON

Consult: Smith, George, *Life of Alexander Duff* (3rd ed. London 1899); Paton, William, *Alexander Duff* (London 1923).

DUFFERIN AND AVA, FIRST MARQUIS OF, FREDERICK TEMPLE BLACKWOOD (1826-1902), British diplomatist and administrator. He was employed in diplomacy while still a youth, but his *Letters from High Latitudes* (London 1857; 11th ed. 1903), a book of travel, first brought him before the public eye. As British representative on the Syrian Commission (1860) he was the author of a satisfactory solution in Syrian autonomy. He entered politics under

Lord Palmerston and was made undersecretary for India (1864) and for war (1866). He became a member of Gladstone's government (1868) and governor general of Canada (1872). His government of the new Canadian federation through the difficulties of the Riel rebellion and the "Pacific Scandal" was a diplomatic and democratic achievement of the first importance for the future of Canada and of the empire. This was recognized by entrusting him successively with the embassies that were then of the greatest difficulty and danger: Petersburg (1879) and Constantinople (1881). With 'Abdul-Hamid II Dufferin had to settle the Greek frontier and the Armenian imbroglio and finally the crisis caused by Arabi's nationalist rising in Egypt. He successfully established not only the new relationship of Turkey to Egypt but also the principles of the new regime of a British protectorate in an Ottoman province. His Egyptian report (1883) ranks as an imperial document with the Durham and Montague reports.

He thereby became the obvious successor to Lord Ripon in the viceroyalty of India (1884). There he had to deal with an internal situation of great difficulty due to the devolution of home rule in the Ripon reforms and in the Ilbert bill, and with an international situation of some danger caused by Russian imperialist interventions in Afghanistan culminating in the Penjdeh incident (1885) and the Ishak Khan insurrection (1888). Eventually he fixed a satisfactory frontier to Russian aggrandizement in Central Asia and placed relations between India and Afghanistan on a firm and friendly footing. Although he pursued a policy of marking time in the march toward representative responsible self-government in India he established a legislative council in the North-West Province and he eradicated a real root of unrest by his realization of the Ripon land reform in Bengal (1885), in Oudh (1886) and in Punjab (1887). Meanwhile Lady Dufferin was laying the foundations of a new cooperation between British and Indians by her welfare work for women. But if in these reforms he was promoting the principles of cooperation and conciliation of the new British Empire by permitting the Burmese war and the annexation of Burma (1866) and the Tibetan operations (1888), he was at the same time prosecuting the last and not the least questionable extension of the old empire principles of conquest and coercion.

Dufferin and Ava, 2 vols. (London 1905); Walpole, Spencer, *Studies in Biography* (New York 1907) p. 141-69; Leggo, William, *The History of the Administration of the . . . Earl of Dufferin* (Montreal 1878); Stewart, George, Jr., *Canada under the Administration of the Earl of Dufferin* (2nd ed. Toronto 1879). The journals of Lady Dufferin, covering residence in Canada, Russia, Turkey and India, contain detailed and personal accounts of the diplomat's life.

DUGUIT, LÉON (1859-1928), French jurist and political theorist. Duguit was a professor in the faculty of law at the University of Bordeaux, where he taught for forty-two years. He also lectured at universities in the United States, Argentina, Portugal, Rumania and Egypt. Duguit is known for his application of philosophical positivism to jurisprudence and political theory. The third edition of his chief work, *Traité de droit constitutionnel* (2 vols., Paris 1911; 2nd ed., 5 vols., 1921-25; 3rd ed., 3 vols., 1927-30), is an exposition in their most complete development of his doctrines, which greatly influenced current legal and political philosophy.

Duguit's aim was to evolve a theory of the law and the state based solely upon experimental data and excluding all metaphysical ideas. Accordingly, he rejected the subjective conception of law, which consists in taking subjective right as the basis of law, because subjective right, being the power of the will to impose itself upon another will, is a metaphysical concept. To him the true conception of law is objective: law exists in the form of a body of rules arising from social relationships, necessitated and determined by them. These rules, beginning as mere social rules, develop into rules of law when "the man of individual consciousness" considers it necessary to assure their observance by a socially organized sanction. The primary fact in the realm of law therefore is not subjective right but the objective rule of law springing from social relationships. This conception led Duguit to reject the German theory of law as a creation of the state, a sovereignty subject only to its own limitations. He insisted that experience shows law to be anterior and external to the state, which because of its nature may itself be limited by law. The state, according to him, is a social phenomenon resulting from a differentiation of forces between the governors and the governed which necessarily occurs in every group, for the governed need to be governed and the governors have the force required for governing. The state has no title to sovereignty since it consists merely of a group of governing individuals. These gov-

ernors in spite of their greater power are themselves subject to law and therefore have not that superiority of will which constitutes sovereignty. The notion of the state as an entity distinct from the governors and the governed is a metaphysical or fictitious concept.

Finally Duguit applied his positivist method to the juridical technique in order to eliminate all metaphysical concepts in that field. His theory of the juridical act is based upon the idea that the will is endowed with no creative power of relevance to law. The will merely launches the application of objective law in a particular case, and the effect of law thus proceeds directly from objective law.

DÜHRING, EUGEN KARL (1833-1921), German economist and philosopher. Dühring studied and practised law until an eye ailment which resulted in blindness forced him to abandon it for a teaching career. He was an instructor in philosophy and economics at the University of Berlin from 1863 until 1877. Afterward he became editor first of *Der moderne Völkerggeist* and later of *Personalist und Emancipator*. His writings in the fields of philosophy, literature, mathematics, ethnology and the natural and social sciences are among the important intellectual achievements of the nineteenth century. Dühring's lack of moderation and his attacks upon Judaism re-

sulted, however, in a general boycott of his work and it is only recently that his philosophic and sociological writings have been given proper recognition.

Dühring's philosophy, of which his economic doctrine is a part, has the point of view of positivism in that it demands a unitary knowledge of existence based upon clearly defined, fundamental principles which are to be derived solely from the study of the true nature and social life of man, uninfluenced by metaphysical concepts. Knowledge is to be the foundation of the harmonious reorganization of life in which social justice will reign and in which violence and pernicious egoism in human relations will be eliminated.

Dühring criticized sharply both the classical and historical schools of economics and was strongly influenced in his sociological thinking by Carey and List. He was the first scientific critic of Marxian doctrine and as a pronounced anti-Hegelian rejected Marx' dialectical argument of the development of capitalism into socialism, according to which social betterment will come not from united human effort but only from "a grim participation in the fiercest struggle of antagonisms." Dühring objected even more to the utopian theories of the early socialists because they rested upon a complete misunderstanding of human nature. According to Dühring it is not primarily the economic system which causes social injustice but rather the extra-economic, political and social factors which intervene in all economic processes. For example, existing property relationships are the result of historical-political development and accord property owners an unfair advantage over labor. Nevertheless, private property must not be abolished, for it is in accordance with the necessary division of function in human activity and without it great economic achievements are inconceivable. For the same reasons interest upon capital is entirely justified. It is not private property and capital, Dühring held, but their misuse which must be eliminated. Property owners, taking advantage of their position, may keep wages at a minimum of subsistence scale although the increasing productivity of labor warrants a growing wage quota. Only by organization can labor prevent this misuse of power and obtain its rightful wage, which consists of the earnings of production minus rent and interest. By organization labor will become equivalent in power to capital and the workers will be able to withhold the labor power which is essential to the utiliza-

tion of capital. The state by appropriate intervention must also hinder the abuse of economic power.

DUMONT, ARSÈNE (1849-1902), French sociologist and demographer. Dumont was born at La Cambe (Calvados) and studied at the École d'Anthropologie in Paris. His special interest was in the problem of the depopulation of France. He held that the lowering of the birth rate, which is the immediate cause of the decreasing population of certain civilized peoples, is a purely voluntary phenomenon, one of the consequences of modern civilization in so far as the latter rests upon an individualistic conception of existence. In democratic societies, in which each individual has the hope and the possibility of rising, such a rise implies to the individual an alleviation of the family burdens involved in the rearing of children. Dumont defines as social capillarity (*capillarité sociale*) the ability to rise in the social scale along with the increasing desire to do so, leading to a voluntary restriction upon the number of children. This desire is stimulated in modern democratic societies by the fact that political equality exists side by side with economic inequality. Dumont established a law that if the social

capillarity is active the birth rate is low, but if for whatever cause social capillarity is checked the birth rate makes an upward turn. He supported his thesis by many regional demographic studies.

DUMONT FAMILY, German journalists. Marcus Theodor Dumont (1784-1831), the son of a family connected with official and ecclesiastical circles in Cologne and a lawyer by training, took over the *Kölnische Zeitung* in 1805. The paper was suppressed by the officials of the French occupation but reappeared in January, 1814. Dumont set for the paper a policy of supporting the Catholic church and opposing the spread of the "English machine system" on the argument that it would make beggars of two thirds of the German people.

His son Josef (1811-61), a champion of freedom of the press, gave the paper its first real importance. He made several important improvements in the technical aspects of the work, established a carrier pigeon service for news (especially stock exchange quotations) from Paris to Aachen, and set for the paper a new tradition of liberalism. The *Kölnische Zeitung* henceforth played an important role in the development of Rhineland liberalism. As early as 1837 it began to publish editorials, and in the troubled days of 1848 it voiced effectively views of the liberal group. Josef Dumont was also a pioneer in developing the amusement and special feature aspects of the newspaper; he introduced novels in instalments and special editions, such as that on the completion of the cathedral.

Beginning in 1880 August Neven, a son-in-law of Josef Dumont, took over the paper and was followed by his sons Josef and Alfred Neven-Dumont. The *Kölnische Zeitung* continued to espouse liberal causes and was, under the editorship of K. H. Brüggemann, from 1846 to 1855 a pillar of free trade sentiment. It is still

regarded as a significant liberal political newspaper.

DUMOULIN, CHARLES (1500-66), French jurist. Dumoulin was an advocate at the Parliament of Paris. As a result of his conversion to Calvinism and his attacks upon the Catholic church he was forced to leave France and he went to Germany, where he lectured at Strasbourg and other universities. In his *Tractatus commerciorum et usurarum, reddituumque pecunia constitutorum et monetarum* (Paris 1546), which particularly aroused the wrath of the Catholics, he contended that usury was not forbidden by divine law and that regulated interest should be permitted.

Dumoulin was a bitter opponent of feudalism and a staunch adherent of the doctrine of royal authority. He held that the administration of justice was an attribute of royal power, the feudal courts having only delegated authority. He was the first great exponent of a national law of France, breaking away from the imperial law, modified by custom, supported by his predecessors. In the "Oratio de concordia et unione consuetudinum Franciae" (*Tractatus*, p. 356-60) he advocated the amalgamation of all the customs into one code, which should be enforced in all territories governed by customary law. In his commentaries on the customs of various localities he constantly emphasized the superiority of the custom of Paris. His commentary on the latter was of special significance and most of his criticisms of it were accepted in the reform of 1580.

Dumoulin's chief contribution to the development of law was the doctrine of free will, that in all transactions not governed by a positive provision of law the will of the parties should be allowed full scope. This doctrine, which has had great vogue in France under the name "autonomy of the will," has determined the English rule that a contract is governed by the law intended by the parties. Where the intention of the parties is not clear he held that it should be de-

terminated by studying all the circumstances surrounding the making of the contract. Dumoulin's most famous application of his doctrine was to acquests of property during marriage. He was of the opinion that spouses whose first domicile was under the law of Paris had tacitly agreed, where there was no express agreement, to hold all acquests during the marriage in accordance with the provisions of the custom of Paris. While this is not law in the United States it has been accepted as the basis of a decision on a similar point in the English House of Lords. Dumoulin's general doctrine of freedom of the will in legal transactions has been adopted by most modern European jurists, and it is only lately that it is being questioned in important juristic thought.

DUMPING as a term in the literature of commercial policy was first used during the English tariff controversy of 1903-04, although reference had often been made previously to the use of one country as the dumping ground for another. In its original meaning and as now used by careful writers in English and in many other languages in which the term has become fairly well established it signifies sale for export at prices lower than those charged to domestic buyers. It should not be applied to cases of spurious dumping, where an apparent excess of domestic over export price can be explained by differences in the conditions and terms of sale, such as differences in quality, in size of order, in terms of payment, in dates of sale or in liability to special taxation. Conversely, genuine dumping may be concealed; the export price is apparently not lower than the domestic price but covers items not included in the latter, such as extra costs of packing and delivery, more favorable terms of payment and the like. Dumping occurs whenever the f.o.b. mill or factory price is lower for export than for domestic sale after reasonable allowance for any differences in conditions or

terms of sale. Dumping is thus the foreign trade parallel of local price cutting in internal trade, as defined in American legal usage.

Dumping appears to be an ancient practise. An Elizabethan writer charged foreigners with selling paper at a loss in England in order to crush a new domestic paper industry. In the seventeenth century the Dutch were charged with selling in the Baltic region at ruinously low prices in order to force the French out of the trade. The first American fine china pottery, set up before the revolution, failed, it was claimed, because of predatory English dumping. Adam Smith refers to an instance of the combining of producers in order to establish private export bounties and thereby reduce the supply for the domestic market. After the Napoleonic wars there were many complaints in the United States and in France that English producers were deliberately hindering the development of domestic industries in these countries by selling for export at especially low prices.

The rise of large scale production, using expensive plant and equipment and able to charge prices above the world market level in the domestic market because of monopoly control thereof and protection by the tariff against foreign competition, first made systematic dumping an important and conspicuous trade phenomenon about 1890. The American trusts, such as the United States Steel Corporation, which before the war accounted for 95 percent of American steel exports, largely at dumping prices, the International Harvester Company and the Standard Oil Company, constituted one prominent group of dumping concerns. Another group was the German cartels. They have stimulated dumping by the assignment of maximum domestic quotas to member concerns or by the grant of export bounties financed by levies on the members in proportion to their output or to their domestic sales. German cartels have also been charged with predatory dumping intended to crush competitors, but of this there have not been many well authenticated instances. Large manufacturing concerns in other countries, such as France, Belgium, Canada and to a less extent Great Britain, also resorted to dumping more or less systematically. With the inauguration of the five-year plan in U.S.S.R. there appeared considerable agitation against alleged dumping by that country, but in the absence in Russia of the ordinary costing and price systems of the capitalistic world the concept of dumping scarcely seems applicable to the Russian practises. On

the whole, dumping was widespread before the war and has been common in the post-war period.

Intermittent or sporadic dumping may be undertaken for various reasons. Where an exporter ships goods abroad for sale on consignment or at auction there may be unintentional dumping if the goods, after allowance for freight and other costs of shipment, bring less than the prices prevailing in the domestic market. An exporter may dump to get rid of an occasional overstock without "spoiling" his home market, to maintain connections and good will in a temporarily depressed market, to introduce his commodity abroad, to eliminate competition in a foreign market or to retaliate against dumping in his home market by a foreign competitor.

Dumping may be maintained for long periods where its objective is to obtain the economies of full utilization of existing production facilities while charging a high price at home. It may continue indefinitely where a plant is deliberately built on a scale larger than is required to take care of the domestic market. Government export bounties, especially if granted to a competitive industry so that they are not absorbed as an extra profit by the producers or exporters, tend also to lead to dumping, which will continue as long as the bounty is maintained. In fact, systematic long time dumping is not conceivable under competitive conditions in the absence of export bounties: competitive producers would tend to confine themselves to the higher price domestic market and leave the export trade to others, with a consequent tendency either toward the equalization of domestic and export prices or toward the cessation of export.

An approach to monopolistic control of the home market is perhaps the most important prerequisite to the existence of dumping as a systematic and normal practise. In accordance with the principle of discriminatory monopoly price, or charging what the traffic can bear, it will pay the monopolist to carry total production to the point where marginal cost for output as a whole, marginal gross revenue from home sales and marginal gross revenue from export sales are all equal to one another. Only by the unlikely coincidence that at the point of equilibrium the elasticity of demand will be identical in the two markets will this involve uniform prices in both markets. Since in the export market there will be other competing sellers, the foreign demand is likely to be more elastic than the domestic and the foreign maximum rev-

enue price therefore lower than the domestic. It may well be that the maximum revenue domestic price may be even higher than the maximum obtainable export price. For the special case where under a uniform price policy the optimum price would not permit of any export sales, it has been shown that resort to dumping with a consequent increase in output would lead to a higher domestic price if marginal costs increased and to a lower domestic price if marginal costs decreased. The important problem, however, of what is the effect of dumping on domestic price when some export business could be obtained even under the optimum uniform price still awaits solution; under these circumstances it appears that resort to dumping always raises the maximum revenue domestic price and increases the cost to the domestic consumer by more than the increase in monopoly revenue.

Tariffs facilitate dumping by protecting domestic monopolies in the home market from foreign competition. For bulky products, however, dumping on a systematic scale is possible up to the limit of the transportation costs to and from the foreign market even for industries in a free trade country. English industries, for example, have engaged in dumping without receiving any tariff protection. Occasionally the buyers of a dumped commodity will guarantee against its resale in the country of origin. There is no doubt, however, that without tariffs the possible extent of systematic dumping would be much less than it is.

Since agriculture is usually organized on the basis of small scale production by many individual farmers, dumping of agricultural commodities rarely occurs except when stimulated by government export bounties. It is agricultural commodities, however, which most frequently receive such bounties, and occasionally an agricultural industry organizes itself sufficiently to establish export bounties or minimum export quotas as a means of stimulating exports and thus bringing about higher domestic prices. Disposal of surpluses abroad at dumping prices has been a prominent feature of the McNary-Haugen and other schemes for farm relief which have been the subject of discussion in the post-war period in the United States.

Public opinion in the dumping country is often hostile to dumping on the ground that it results in higher prices to domestic consumers, which, as has been shown, may not be true; and that it provides foreign competitors with cheaper raw materials than are available to the domestic

producers. The prosperity of the Dutch ship-building industry, in fact, was largely due to the availability of German steel at dumping prices. To meet this criticism German cartels before the war adopted the practise of extending to domestic industries on their purchases of materials destined for export in further manufactured form as low prices as those charged to foreign buyers; this has occasionally been done also in the United States and elsewhere. It has sometimes been suggested that reimport free of tariff duties be permitted for products exported at dumping prices. An amendment to the tariff bill providing that tariff protection be withdrawn from industries selling for export at prices below the domestic prices was introduced into the United States Senate in 1921 and was defeated by only ten votes.

To the importing country cheapness of imports is an advantage, unless the cheapness is so temporary that it results in greater injury to domestic industry than benefit to consumers. Importing countries have legitimate ground for taking protective measures against dumping only because dumping is usually intermittent or short run and can never be depended upon to continue indefinitely. Even when the importing country has no competing industry it may be injured by temporary dumping if this results in the establishment by the dumper of monopoly control over its market.

Antidumping legislation made its appearance in response to the clamor raised against the allegedly injurious effects of American and German dumping. In 1904 Canada enacted the first antidumping law specifically providing for the imposition of additional duties on imports sold at dumping prices. Measures following more or less closely the Canadian model were enacted by the Union of South Africa in 1914 and by the United States, Great Britain, Australia, New Zealand and Newfoundland in 1921. Only the Canadian act of 1904, amended in 1907 and 1921, and the United States and Newfoundland laws of 1921 are clearly mandatory in form, the others being applicable at the discretion of the customs or other authorities. Australian legislation from 1906 to 1910 and several American statutes deal in addition with predatory dumping as a phase of unfair competition. Since the World War a number of countries, including Canada, New Zealand, Japan, Germany and Rumania, have passed laws which authorize an increase of duties by administrative act whenever a domestic industry is threatened

by abnormal or unreasonable foreign competition; although these enactments do not refer specifically to dumping they may be used as antidumping measures. For Canada, South Africa, Australia and the United States, where the antidumping laws are systematically applied, there appears to be fairly general agreement among the customs officials and the business interests that this legislation has been successful in checking serious and systematic dumping. The legislation in most of the other countries appears to be wholly or largely inoperative except as it provides reserve measures to be used if an emergency should arise. One factor explaining this failure to apply existing legislation is the absence, in countries using mainly specific duties in their ordinary tariffs, of adequate administrative machinery for the ascertainment of values of imports, which is essential for the effective use of antidumping legislation.

Since the 1860's many countries have attempted to protect themselves against dumping resulting from government bounties by introducing into their commercial treaties provisions pledging the signatories not to grant bounties. These pledges, however, have been frequently violated. The multilateral Brussels Sugar Convention of 1902 was fairly successful in bringing about the abolition of sugar bounties and also the limitation of import duties on sugar to a stated level which it was thought would not be high enough to stimulate dumping on private initiative, but the agreement became inoperative with the outbreak of the World War. Many countries, beginning with the United States in 1890, have enacted provisions for countervailing duties on imports which had received official export bounties. In 1922 the American provision was made to apply also to production bounties and to non-governmental export bounties. Most of these provisions, however, have been discretionary in form and have remained practically inoperative.

The compatibility of antidumping and bounty countervailing duties with most-favored-nation obligations, especially when such duties are made applicable to all shipments originating in specific countries instead of to specific shipments, has been seriously questioned and was in 1931 under investigation by the Economic Committee of the League of Nations.

During the post-war period the term exchange dumping has been applied to exports from certain European countries with rapidly depreciating currencies, although such exports have not

necessarily involved lower prices than those charged to domestic buyers. These export sales could be profitably made at prices which in terms of stable currencies were extremely low, because the exchange rates of the depreciating currencies often fell more rapidly than their internal purchasing power. Many countries enacted legislation authorizing the application of additional duties on imports from countries with depreciated currencies but only a few countries ever actually applied them, and then chiefly or solely on imports from Germany. The amount of such duties was usually made to depend on the difference between the exchange value and the mint par value of the foreign currency, an illogical standard since exchange dumping when it occurs is due not merely to the existence of depreciated currencies but to their progressive depreciation on the exchange market at a more rapid rate than in their internal purchasing power. It would be more logical to make the exchange dumping duties depend on the rate of exchange depreciation of the foreign currencies per unit of time. Even this procedure would cease to be appropriate after a time, because with the continuous depreciation of a currency a point is reached at which the rate of fall in its internal purchasing power tends to approach and even to surpass the rate of fall in its exchange value for stable foreign currencies. With the general stabilization of currencies of the European countries exchange dumping ceased to be an actual problem.

DUNANT, JEAN HENRY (1828-1910), Swiss philanthropist. He was a member of a well-to-do and religious Genevese family and the promoter of a number of humanitarian ideas. As a result of witnessing the terrible suffering of the wounded at Solferino in 1859 Dunant published *Un souvenir de Solferino* (Geneva 1862; tr. by Mrs. D. H. Wright as *The Origin of the Red Cross*, Philadelphia 1911), an appeal to world opinion containing two proposals: the neutralization of the wounded and the creation in all countries of permanent societies to care for war victims, supplementing the inadequate army medical services. Dunant, while expressing disapproval of war, argued that its inevitability made necessary such steps for the sake of humane and Christian feeling. His book met with considerable response. He undertook a campaign to promote his ideas which resulted in the convocation in 1863 of an international conference, which has been called the Red Cross constituent conference and of which he was secretary. In 1864 a diplomatic conference met to decide on questions of international law raised by the resolutions of 1863. It drew up the Geneva Convention, which was completed by later agreements. This convention proclaimed the neutralization of ambulances, military hospitals and their personnel. The military sick and wounded of all nations are collected and cared for. A distinctive flag is adopted for hospitals, ambulances, evacuations; a brassard is permitted for the neutralized personnel. Both consist of a red cross on a white ground.

The signature of the Geneva Convention marked a new stage in the development of international relations. Dunant's second fundamental idea—the creation of national societies for aid to the war wounded—was realized later, and today most occidental countries possess a Red Cross society. He also published a condemnation of slavery based on Christian and humanitarian arguments. When he was awarded the first Nobel prize, protests were registered on the ground that such ideas as his tend to perpetuate wars by making them more tolerable.

GEORGES MILSOM

DUNBAR, CHARLES FRANKLIN (1830-1900), American journalist and economist. Dunbar graduated from Harvard College in 1851. He engaged first in business and for a time in farming; later he studied law and was admitted to the bar in 1858. Public affairs rather than legal practise attracted him, however, and

starting with minor contributions he became an editor and part owner of the *Boston Daily Advertiser* in 1859. For the next ten years all his energies were given to its editorial and business management, and under his leadership it reached and held the position of the most influential newspaper in New England.

In 1869 Dunbar was offered a professorship in political economy in Harvard University. He devoted two years to preparatory travel and study and entered upon academic duties in the autumn of 1871. Professor Taussig has finely set forth Dunbar's ideal of the duties of the university teacher: "a leader in thought and in investigation, elucidating the principles on which the solution of current problems must depend, contributing by slow accretions to the mass of information on which the advance of knowledge must rest, and leaving it for others to spread abroad and apply the result of the scholar's research." During the next thirty years as teacher, as senior officer of the department of political economy, as dean of Harvard College (1876-82) and as dean of the faculty of arts and sciences (1890-95) Dunbar attained a commanding place in the development of economic thought in the United States. His contributions to his particular field consisted especially in penetrating studies of the history and theory of banking, in original analyses of the nature and service of credit and in a scholarly review of the origin and progress of American economic writing.

Even more important, certainly more enduring, than any of these was Dunbar's service as editor of the *Quarterly Journal of Economics* from the establishment of the journal in 1886 through the next ten years. The distinction of content and form and the adherence to scientific purpose which have characterized the journal among economic publications in the United States and abroad must be accounted to the impress of its first editor.

Important works: *Laws of the United States, Relating to Currency, Finance and Banking from 1789 to 1891* (Boston 1891, rev. ed. 1897); *Chapters on Banking* (Cambridge, Mass. 1885; 5th ed. by O. M. W. Sprague with title *The Theory and History of Banking*, New York 1929); *Economic Essays* ed. by O. M. W. Sprague with an introduction by F. W. Taussig (New York 1904).

Consult: Eliot, C. W., *Sons of the Puritans* (Boston 1908) p. 59-90; Hall, E. H., "Memoirs" in *Massachusetts Historical Society, Proceedings*, 2nd ser., vol. xiv (1901) 218-28.

DUNCKER, FRANZ GUSTAV (1822-88), German politician and labor leader. In 1853 Duncker secured control of a suspended progressive newspaper and reissued it as the *Berliner Volkszeitung*, which became an important organ of the liberal opposition. He was one of the founders of the National Union in 1859 and later of the Progressive party, being elected in 1861 to the Prussian Landtag, in 1867 to the Reichstag of the North German Confederation and in 1871 to the German Reichstag, of which he was a member until 1877.

In his newspaper and in the legislatures Duncker opposed monarchical absolutism and worked to extend the people's rights. He criticized Bismarck's policy of force in internal politics where it ran counter to his own democratic and progressive views, and also championed social reform and the right of the workers to combine. His publishing house issued works by Marx, Lassalle and Schulze-Delitzsch. Duncker warmly supported the efforts of Schulze-Delitzsch and the cooperative movement as a whole. His friendship with Lassalle continued until the latter violently attacked the Progressive party.

The social question Duncker considered a chain of diverse problems to be solved by political measures of an economic as well as social character. Since the patriarchal relationships of the guild system were broken and could not be restored, Duncker insisted that employers and employees must cooperate in their common tasks. Together with Max Hirsch (*q.v.*) he strongly opposed the socialist insistence that the labor unions then being formed should be hostile to capital. The two men were the spiritual fathers of the *Gewerkvereine*, which came to be known as Hirsch-Duncker trade unions in contradistinction to the "free" socialist unions and the Christian unions. Addressing the delegates to the *Gewerkvereine* organization meeting in 1868 Duncker said that their movement was "not a class struggle but a defense of their just rights aiming at the establishment of sound and lasting peace; for social war works solely for the foes of freedom and the fatherland and injures the welfare of all classes, while class cooperation places the freedom and welfare of the fatherland upon sure and lasting foundations."

G. BRIEFS

DUNCKER, MAXIMILIAN WOLFGANG (1811-86), Prussian historian, politician and patriot. Duncker was the son of the famous Berlin publisher Karl Duncker and studied at Bonn and Berlin under Ranke, Ritter, Boeckh, Savigny and Hegel. He was a member of the Frankfort National Assembly of 1848 and later held the post of director of the Prussian state archives; for many years he was a close confidential adviser to Crown Prince Friedrich Wilhelm and one of the most active contributors to the *Preussische Jahrbücher*. A prolific publicist and ardent politician, Duncker stood in the midst of the movements that led to the unification of Germany and the establishment of the empire.

Duncker faced problems in the philosophy of history and political science as boldly as situations in practical politics. He felt it necessary not to separate his interest and activity in current affairs from his scientific research into the history of the ancient world. Thus he was acquainted with the spirit of all ages: antiquity, mediaeval and modern times. Peoples from India to England and of the remotest past as well as of the immediate present were of equally great interest to him. His *Geschichte des Alterthums* (4 vols., Berlin 1852-57, 5th ed. 9 vols., Leipsic 1878-86; tr. by E. Abbott, 6 vols., London 1878-82), which stands between Heeren's and Eduard Meyer's presentations and was written at a time when research into the history and culture of the ancient Orient was just beginning, takes up the migrations of peoples, the forms of their political and social organization and their political and religious struggles. His work is historically rationalistic, moderately liberal, full of a strong ethos, temperate but spirited, not always profound or critical. It has been criticized in many respects but for a long time held its place beside the works of Grote and Curtius and has been translated into several foreign languages.

Schultze (Leipsic 1923).

DUNNING, T—J— (1799-1873), English trade unionist. He was one of the group instrumental in the transformation of the "general" Owenistic unionism into the efficiently organized bargaining unionism of the second half of

the nineteenth century and in the formulation of its philosophy. As secretary of the London Consolidated Society of Bookbinders from 1843 on he participated in the practical work of organization, such as the formation of the London Trades Council, and as ally in the work of the Junta for the legalization of trade unionism as well as in the limited political program of the Labour Representation League, formed in 1869. As editor of the *Bookbinders' Trade Circular* he helped explain to the public as well as to trade unionists the basic principles of the newer unionism. His position of leadership was recognized in his appointment in 1860 to the celebrated Committee of Inquiry into Trade Societies set up by the Social Science Association.

A further important contribution was a pamphlet published by himself (London 1860) entitled *Trades Unions and Strikes: Their Philosophy and Intention*. This emphasized the necessity of a conciliatory policy limited to purely trade interests and based upon an acceptance of the "law" of supply and demand as applied to wages. But he urged that the effect of the law be mitigated by methods of mutual insurance and limitation of supply. The pamphlet has been hailed by the Webbs as "the best presentation of the Trade Union case which any manual worker has produced" (p. 188) and is still cited in controversial material on collective bargaining. It contained a criticism of the wage fund doctrine which gained the respect although not the adherence of John Stuart Mill.

FRANCES E. GILLESPIE

Consult: Webb, S. and B., *The History of Trade Unionism* (London 1920).

DUNNING, WILLIAM ARCHIBALD (1857-1922), American historian and political scientist. As teacher of history and political philosophy at Columbia University from 1886 to 1922 he exerted a profound influence on American scholarship, directing, especially in his seminars, the investigations of many students who later were to become outstanding authorities in their fields (see *Studies in Southern History and Politics; Inscribed to William Archibald Dunning . . . by His Former Pupils, the Authors*, ed. by J. W. Garner, New York 1914, and *A History of Political Theories, Recent Times; Essays . . . Contributed by Students of the Late William Archibald Dunning*, ed. by C. E. Merriam and H. E. Barnes, New York 1924). He was one of the founders of the American His-

torical Association and of the American Political Science Association and from 1894 to 1903 was managing editor of the *Political Science Quarterly*.

His doctoral dissertation, *The Constitution of the United States in Civil War and Reconstruction 1860-1867* (New York 1885), was followed by *Essays on the Civil War and Reconstruction* (New York 1898, rev. ed. 1904), *A Little More Light on Andrew Johnson* (Cambridge, Mass. 1905), *More Light on Andrew Johnson* (New York 1906) and by his volume in the American Nation series on *Reconstruction, Political and Economic, 1865-1877* (New York 1907). By his detached objective treatment he succeeded in removing the many prejudices which hitherto had prevented an accurate analysis of the reconstruction period, and by his influence on other scholars he cleared the way for a thoroughgoing reinterpretation. In 1914 he brought out a notable volume entitled *The British Empire and the United States* (New York), which contained a survey of Anglo-American relations during the hundred years of peace following the Treaty of Ghent.

It was in the field of political theory, however, that Dunning's most important literary contributions were made. These included *A History of Political Theories, Ancient and Mediaeval* (New York 1902), which contained a brilliant analysis and evaluation, with complete freedom from dogmatism, of the doctrines and philosophy of the more important political writers from Plato through Machiavelli. This volume was followed by *A History of Political Theories from Luther to Montesquieu* (New York 1905) and *A History of Political Theories from Rousseau to Spencer* (New York 1920). The conclusion reached by the author is somewhat pessimistic—perhaps not altogether borne out by the body of the work itself—in its skepticism as to whether during the twenty-three centuries from Plato to Spencer there was any appreciable advance in the solution of the problems of political philosophy. The three volumes, which in large measure have superseded the work of Bluntschli and earlier authorities, caused Dunning to be recognized as the outstanding American scholar in this field and have been in large part responsible for the increased attention now paid to the subject in American universities.

DUNOYER, BARTHÉLEMY CHARLES PIERRE JOSEPH (1786-1863), French economist. As editor of the *Censeur* from 1814 to 1816 and of the *Censeur européen* in 1818-19 Dunoyer, with his collaborator Charles Comte, struggled against the aristocratic authoritarianism of the Restoration government. While other opponents of this attempted absolutism were arguing from "metaphysical" theories of sovereignty and of natural rights, Dunoyer urged a doctrine based on the social necessity of granting the maximum of opportunity to the producing class. Not only must the principle of laissez faire be strictly observed, but government must be transformed into a mere subsidiary institution, in effect the servant of industry. The establishment of the bourgeois monarchy in 1830 satisfied Dunoyer, the more so because it offered a bulwark for industry against the rising socialist and revolutionary factions. Dunoyer joined the government, assuming office as prefect in 1830 and as counselor of state in 1838. The great treatise of his maturity, *De la liberté du travail* (3 vols., Paris 1845), which appeared as a revision of a work first published in 1825, was a defense of the old economic liberalism against the new democracy.

In anticipation of Spencer, Dunoyer here developed the idea that society was an organism, in which it fell to the lot of a congeries of institutions and individuals to perform specific functions. The function of government was the preservation of order, and to this role, which in the *Censeur* he had minimized or overlooked, he now assigned vital importance. To justify the work of government officials as well as of those supporters of the bourgeois monarchy who were drawn from the professional classes Dunoyer extended the classical concept of product to include the "immaterial" product, or service; in this he followed J. B. Say, Germain Garnier and Destutt de Tracy. The *Liberté* was emphatic in denying the wisdom of governmental intrusion into economic affairs, particularly for the purpose of relieving the laboring class. Laborers were born in natural bondage, and with the utmost extraneous assistance could never hope to achieve genuine liberty, which Dunoyer defined as the power to make free and intelligent use of faculties. Pointing to the Malthusian law he showed that any diversion of wealth to the lower classes must inexorably diminish the proportion between population and subsistence. With these substantiating arguments he declaimed against public education, universal

suffrage and charity. After the Revolution of 1848 Dunoyer's qualified and specific liberalism submitted to a new modification and manifested itself in *Le second empire et une nouvelle restauration* (2 vols., London 1864) as a legitimism, an appeal for the return of the Bourbons.

Say: Charles Dunoyer" in *Revue d'histoire économique et sociale*, vol. iv (1911) 115-47; Mignet, F. A., *Nouveaux éloges historiques* (Paris 1877) p. 239-84.

DUNS SCOTUS, JOHN (Doctor Subtilis) (1266-1308), scholastic philosopher. Scotus was born in Scotland. At an early age he entered the Franciscan order and was sent first to Oxford, where he soon became famous as a teacher of philosophy and theology, then to Paris and finally to Cologne.

Scotus is important in the history of political science as one of the pioneers of modern social theory. His doctrines bear a strong resemblance to the later teachings of Locke. Scotus' account of the social contract is a philosophic analysis of the origin of society. Society, he held, was naturally organized into family groups; but when paternal authority was unable to enforce order, political authority was constituted by the people. Accordingly all political authority is derived from the consent of the governed.

Concern for the public welfare is the basis of Scotus' economic doctrines. He regarded private property as a product of positive rather than natural law and insisted that property must not be administered in a way detrimental to the community. He formulated principles for the equitable employment of various commercial contracts, and while he accepted the current conception of a just price he recognized the social importance of a merchant class.

Scotus' chief importance, however, lies in the contrast of his teaching to that of his great Dominican predecessor, Thomas Aquinas, whose philosophical system was intended to harmonize Aristotelian doctrine with the traditional theology of the Catholic church. His philosophy is much less strictly Aristotelian than Aquinas' and he blends with the peripateticism almost universally accepted in the late thirteenth century many elements, Platonic rather than Aristotelian in origin, derived from the earlier Augustinian scholasticism, to which the Franciscan order continued to adhere. There is also in Scotus a dis-

tinctly empirical strain of thought reminiscent of Roger Bacon, particularly in his theory of cognition, the most penetrating and mature attempt made by the mediaeval mind to solve the epistemological problem. Another important point in which Scotus' teaching differs from that of Thomas Aquinas is his insistence upon the primacy of the will over the intellect. His theory of volition is original and surprisingly modern in spirit, a great advance in psychological analysis over the intellectualism of Aquinas with its deterministic implications. In theology it is interesting to note that Scotus upheld the doctrine of the Immaculate Conception, which was rejected by Aquinas. Scotus' doctrine has since become a dogma of the church.

DUPLEIX, JOSEPH (1697-1763), French colonial administrator. Dupleix revolutionized the policy of the European powers during the critical period of their expansion into India and the Far East. Taking advantage of temporary French superiority of sea power in Indian waters he was able by means of skilful diplomatic intervention among the Indian princes to make himself the leading European influence in India. He changed the hitherto merely commercial interests of the French and British East India companies into a rivalry for territorial and political control. His ambition developed from the conviction that he could extend French influence beyond the coastal trading ports into the interior and erect there a political hegemony which would not only pay its own way but also vastly expand trading opportunities and produce for France and the French East India Company a revenue "fixe, constant et abondant."

Until 1740 the French and British companies had pursued a policy of trade only, avoiding interference in the internal political affairs of India and remaining neutral in the European conflicts of their respective governments. But on the eve of the War of the Austrian Succession,

when the decay of the Mogul power and a Persian invasion rendered opportunity favorable, Dupleix departed from the narrowly commercial policy and boldly supported pretenders to the thrones of the Carnatic and the Deccan. Employing money and native soldiers trained and armed by Frenchmen Dupleix made his protégés rulers of these Indian states. He then succeeded by the capture of Madras in confining the British footing in the Carnatic to a single stronghold; it seemed that all India lay within the grasp of France. Dupleix, a born diplomatist, ambitious, enterprising, at his best in adversity, effectively aided by his wife and the soldier diplomatist Bussy, now contemplated intervention at Delhi and the consolidation of French power by extensive territorial acquisitions.

Reasons for his failure are controversial. Conventionally assigned to the incompetence and corruption of the French government, to the indifference of the East India Company, to jealousies, to avarice, to the quarrel with La Bourdonnais, it seems more probable that the failure resulted from the inadequacy of his resources. India was not "rich" in the sense that Europe then believed. His measures did not pay their own way even though he diverted money sent by the company for other purposes. The French company was not, contrary to common belief, markedly inferior to its British rival in supporting its Indian agents but had neither the vision nor the capacity for imperial adventure. Dupleix, unwilling to be handicapped by the long delays involved in detailed communication with the company in Paris and excessively confident in the speed with which he could achieve success, did not take the company into his confidence; he failed to distinguish effectively between personal and public interests and he could not stem the tide of demoralization caused among his assistants by sudden wealth. In his military operations he made the serious mistake of dividing his forces. His early successes, both diplomatic and military, led him to underrate the tenacity with which the British would cling to their Indian trade and the keenness with which Lawrence and Clive would eventually adopt his own methods. Overconfident in the logical and theoretical soundness of his policy Dupleix discounted the absence of enthusiasm and support among his fellow countrymen and ignored the persistent and practical determination of the British.

DUPONT DE NEMOURS, PIERRE SAMUEL (also Du Pont de Nemours) (1739-1817), French economist and statesman. With characteristic versatility and inability to delimit his interests the youthful Dupont de Nemours considered the army, studied natural science, began to prepare for medicine and wrote poetry. His almost chance publication at the age of twenty-four of *Réflexions sur l'écrit intitulé: richesse de l'état* (Paris 1763) won the attention of Quesnay and of Mirabeau and turned him definitely toward economics. Dupont attached himself to the group of *économistes* headed by Quesnay; in 1765 and 1766 he edited the *Journal de l'agriculture* and from 1768 to 1772 the *Éphémérides du citoyen*. It was in these reviews and during Dupont's editorship that many of the inchoate principles of physiocracy were clarified, developed or given final form. Typical of the scope of the reviews was the variety of Dupont's own numerous contributions, which included a sketch of the history of economics, a clear sighted analysis, anticipating Malthus, of the relation between population and subsistence, schemes of equitable taxation, diatribes against the restriction of the grain trade, logical demonstrations of the economic wastefulness of slavery, ambitious plans for universal education, castigations of commercial monopolies and expositions of physiocratic theory, sometimes admirable for their conciseness, sometimes passing into lofty excursions in the realm of natural philosophy. When his intimate friend Turgot was appointed to the ministry in 1774, Dupont entered the government as his confidential adviser; and later under Vergennes he held a post, which was little to his liking, as minister of internal commerce and official in the "department of the balance of trade." Vergennes also dispatched him on two important diplomatic missions, first in 1783 to discuss with English delegates the question of American independence, then in 1786 to negotiate the Anglo-French commercial treaty, in which for once his thwarted desire to see the principles of economic liberalism realized

was partially satisfied. He sat in the Assembly of Notables and during the revolution represented the bailiwick of Nemours, for which he drew up an unusually original *cahier*, in the Constituent Assembly. Here he fought successfully for the suppression of indirect as well as of abusive taxes and unsuccessfully for sound currency—that is, against the assignats. Although he had long since rejected the physiocratic doctrine of “legal despotism” he still harbored a genuine dread of popular tyranny; hence he soon came under the suspicion of the more progressive revolutionists and after August 10, 1792, when he defended the monarchy, he was forced into hiding. A vicissitudinous career under the Directory ended with his removal in 1799 to America, which to him as to so many other Frenchmen of his time seemed to offer refuge from political persecution, success for commercial enterprise and an invitation for the launching of ambitious social reforms. In 1802 he returned to France and occupied himself with writing until 1815, when he finally settled in America.

It was Dupont de Nemours who first applied the name of physiocracy to the doctrines of Quesnay's school, in a work entitled *Physiocratie ou constitution naturelle du gouvernement le plus avantageux au genre humain* (2 vols., Leyden 1768), which represented a collection of articles by Quesnay preceded by a notice by the editor. Among his other works dealing with physiocracy were *De l'origine et des progrès d'une science nouvelle* (Paris 1768; new ed. by A. Dubois 1910), published as an abridgement of *L'ordre naturel* by Mercier de la Rivière; *Du commerce et de la Compagnie des Indes* (Amsterdam 1769); *Tableau raisonné des principes de l'économie politique* (Karlsruhe 1775); and *Mémoires sur la vie et les ouvrages de M. Turgot* (Paris 1782, 2nd ed. Philadelphia 1788), which he later supplemented by a complete edition of Turgot's works (9 vols., Paris 1808–11). In all these works his dominating purpose was to represent the ideas of Quesnay; yet as he grew more mature he was forced to qualify, gently, it is true, his acceptance of Quesnay's central doctrine—the *produit net*. The aspect of physiocratic theory to which he felt most strongly attracted was its liberalism, in which he saw expressed the immediate corollary of natural philosophy. Indeed, while with unsurpassed vigor he hailed political economy as a new science he never tired of pointing out the essential relation of its principles to the general conception of the world

which had been epitomized in the laws of nature. His conviction that the free operation of those laws would usher in undreamed of prosperity and happiness was equaled only by his awareness of contemporary social evils. At the time of his death Thomas Jefferson, who had been his correspondent for almost twenty years, wrote, “His object never varied, that of the general good.”

(Heidelberg 1892), with introduction by Carl Knies.

DUPONT-WHITE, CHARLES BROOK (1807–78), French economist. A man of wealth, aristocratic tastes and rare conversational talents, Dupont-White lived during most of his life in a studious and literary retirement at Paris. His disciple, the Belgian sociologist Émile de Laveleye, has shown that he developed, probably independently of the Germans, who have sometimes been regarded as its originators, and more than a decade before the Congress of Eisenach (1872), the essential ideas of state socialism or socialism of the chair. As presented in the two most important of his numerous works, *L'individu et l'état* (Paris 1857) and *La centralisation* (Paris 1860), his doctrine was an exaltation of the role of the state founded on the thesis that the state alone possesses the right and the power to guide the forces of progress. The individualist assumption, which placidly declared the “interest of one to be the interest of all,” was demonstrably false; the political counterpart of that assumption, the notion that the duty of the state was fulfilled by its preservation of a legal equality, was no more than a specious pretension to justice. Unless the state should intervene to adjust the physical, intellectual and economic disparities among men, progress, defined as the re-

lease of the human personality, must remain at best partial, at worst completely unrealized. Inequality was nowhere more apparent than in economic relations; Ricardo's theory of wages and Mills' iron law (Dupont-White was a thorough student of both economists) were in themselves irrefutable testimony of the necessary degradation of the worker under a laissez faire regime. Although with a characteristic diffidence before practical solutions he confined himself to suggesting as remedies popular education, public workshops and insurance and new norms of taxation, his program proceeded from the well sustained thesis that the state was the rightful arbiter of economic distribution. The state was more than an instrument directing transitional stages of progress; the perfected society, if that could be envisaged, could exist only by virtue of extreme intervention. An idealist like later state socialists in that he departed from an abstract conception of the state and of social justice, he resembled them also in making concessions to the historical method. He admitted, for instance, that the sphere of the state should vary from nation to nation, depending upon national psychology and traditional institutions. He was essentially a speculator, viewing transient political situations with a detachment so complete that he could develop his exalted idea of the state during the very period when the Second Empire was pursuing its highly arbitrary and to him utterly unjustified policy. Hence while the liberals, preoccupied with the immediate problem of curbing autocracy, were clutching the idea of devolution as a panacea, Dupont-White was presenting cogent arguments in favor of centralization as a corollary of his conception of state intervention. His influence upon contemporary politics remained correspondingly slight.

DUPRÉ DE SAINT MAUR, NICOLAS FRANÇOIS (1695-1774), French economist and statistician. Dupré de Saint Maur entered the administration of finances and became a member of the Court of Accounts. In 1733 he was elected to the French Academy because of his prose translation of Milton's *Paradise Lost* (3 vols., Paris 1729). In the two of his books which are of economic interest, *Essai sur les monnoies; ou réflexions sur le rapport entre l'ar-*

gent et les denrées (Paris 1746) and *Recherches sur la valeur des monnoies, et sur le prix des grains, avant et après le concile de Francfort* (Paris 1762), he patiently compiled and shrewdly annotated a mass of facts and statistics. These deal chiefly with the names and weights of the principal European moneys and the relation between wages and prices; they cover especially the period from 1002 to 1745. His calculations with regard to the population of France and the distribution of land were frequently cited by physiocratic writers. In his *Essai* he presents at great length the ideas of John Locke on money and interest and his exposition probably aided considerably the introduction of the Englishman's views into France. Dupré de Saint Maur also composed some mortality tables which Buffon inserted in his "*Histoire naturelle de l'homme*" (in his *Histoire naturelle, générale et particulière*, vol. ii, Paris 1749, p. 589-603) with the comment that they were the only tables then available "on which one can establish the probabilities of human life in general with some degree of certainty."

LOUIS VIGOUROUX

DUPUIT, ARSÈNE JULES ÉTIENNE JUVÉNAL (1804-66), French civil engineer and economic theorist. Dupuit made important contributions to the development of waterworks and highways as a government engineer and in his technical treatises. As an outgrowth of these activities he became interested in certain problems of utility and monopoly which he elucidated in two articles, "De la mesure de l'utilité des travaux publics" and "De l'influence des péages sur l'utilité des voies de communication," which appeared in *Annales des ponts et chaussées* (2nd ser., vol. viii, 1844, p. 332-75, and vol. xvii, 1849, p. 170-248). With a view to measuring the utility obtained through a particular transaction by an individual purchaser Dupuit evolved a theory of the gradation of utility which he expounded with the aid of geometrical diagrams. He compared what he called absolute utility, the amount which a purchaser is just willing to give for a certain increment of a commodity, with the actual selling price paid or payable. Utility (relative utility) is then defined by him as the difference between the absolute utility and the selling price and is designated as utility profit. It corresponds to Alfred Marshall's consumer's rent. Except for W. F. Lloyd, Dupuit was probably the first to comprehend clearly the economic theory of utility, and with

the exception of Cournot he was the first to use a demand curve. His work was probably done entirely independently of these other men. Dupuit thus became one of the pioneers in both the psychological and mathematical fields of hedonistic economics.

Dupuit also maintained that a private monopoly will charge for articles the price the consumer will bear but that a government seeking the maximum advantage to the public on public roads, canals or railways will in general maintain lower prices than a private monopoly.

Dupuit's later economic writings included "Du principe de propriété: le juste, l'utile" (in *Journal des économistes*, 2nd ser., vol. xxix, 1861, p. 321-47), in which he discussed the origins, legal sanctions and social implications of various property relations and sharply challenged the natural law theory of property; *La liberté commerciale, son principe et ses conséquences* (Paris 1861); and "De l'utilité et de sa mesure" (in *Journal des économistes*, vol. xxxvi, 1853, p. 1-27). For a bibliography of his scientific works see *Titres scientifiques de M. J. Dupuit* (Paris 1857).

OTTO KÜHNE

DURAN Y BAS, MANUEL (1823-1907), Spanish statesman and jurist. Duran y Bas studied at the University of Barcelona, where he became a professor of mercantile law. He was subsequently chosen dean of the faculty of law and rector of the university.

Educated in the principles of the historical school of Savigny, Duran y Bas regarded law as a spontaneous expression of a nation's will. He strongly opposed the suppression of native law and the imposition of an alien legal system. Accordingly, he became a strong protagonist of Catalan regionalism, a movement to which he contributed a doctrinal stimulus by drawing attention to the institutions and customs of private law in Catalonia, especially the law of property and the family. He edited the first volume of a résumé of Catalan law entitled *Memoria acerca de las instituciones del derecho civil de Cataluña* (Barcelona 1883), in which he explained the customary law of his province with great lucidity. He also endeavored to revive the Catalan language as a cultural medium and was instrumental in having chairs of Catalan law and literature established at the University of Barcelona.

In 1898 he was one of the initiators of the great campaign for home rule, which demanded

administrative and political autonomy for Catalonia. The following year, when the Silvela cabinet sought a settlement of this question, Duran y Bas was appointed minister of justice. Shortly afterwards he resigned because he felt that the government's plan for administrative decentralization was not sufficiently far reaching.

FERNANDO DE LOS RÍOS

Works: His studies are collected in *Escritos del . . . Manuel Duran y Bas*, 2 vols. (Barcelona 1888-95).

Consult: Riba, Prat de la, in R. Academia de Jurisprudencia y Legislación, Madrid, *Jurisconsultos españoles*, 3 vols. (Madrid 1911-14) vol. i, p. 283-98.

DURAND, GUILLAUME (Duranti, Durandus) (1237-96), French theologian and jurist. He studied law at Bologna under Bernardo da Parma and Henrico da Susa. Later he taught canon law at Modena and held numerous important ecclesiastical offices.

He was known as the Speculator from the title of his chief work, the *Speculum judiciale* (3 vols., Strasbourg 1473; new ed. Turin 1578), which Savigny said was one of the most important sources for the history of law. This work, which was an amplification of a chapter of his earlier work, *Speculum legatorum*, became a textbook of juridical education in Europe for the next two centuries. It is a four-volume treatise on procedure in both the canon and the civil law. The first volume treats of the judicial personnel, including judges, lawyers and witnesses; the second discusses civil procedure, especially in the Papal States; in the third volume Durant deals with criminal procedure with a thoroughness unknown in other works of the period; the fourth is a sort of civil code and includes a survey of contracts. The theoretical and practical aspects of the law are so well combined in the *Speculum judiciale* that it served as a summary of the canon and civil law as it stood in the second half of the thirteenth century. Johannes Andreae, Baldus and Alexandre de Nevo were among the many who wrote glossaries and commentaries on it. The other juridical works of Durant are *Breviarium, sive repertorium glossarum et textuum juris canonici*, also known as the *Breviarium aureum* (Rome 1474, new ed. Paris 1519), a collection of the opinions of canonists upon controversial questions arranged according to the plan of the decretals; and the *Commentarius in sacrosanctum lugdunense concilium* (Fano 1569), an exposition of the decisions of the council of Lyons of 1274.

The *Rationale divinatorum officiorum* (Mayence

1459, new ed. Naples 1866) enjoyed as great a reputation and influence as the *Speculum*. It deals with the rules of liturgy and incidentally reveals a Gallican tendency to uphold the temporal independence of the king of France together with a strong adherence to the doctrine of papal absolutism within the church. Book I of the *Rationale* has been translated as *The Symbolism of Churches and Church Ornaments* (by J. M. Neale and B. Webb, Leeds 1843; 3rd ed. London 1906) and book III as *The Sacred Vestments* (by T. H. Passmore, London 1899).

DURANTI. *See* DURAND, GUILLAUME.

DURESS is the technical term for force in legal relations; it ordinarily applies to wrongful menaces which inspire fear. It has been noted from very ancient times that many apparently voluntary actions are not expressions of a real wish of the actor but are caused by the force or fraud of another person. These two notions, force and fraud, are coupled even in early legal references, although they are quite different. In the case of fraud it may be assumed that the actor was beguiled into desiring at least temporarily a course of conduct later found to be harmful. In the case of force it cannot be supposed that he ever desired it, except in order to avoid a worse evil.

In ancient societies magic was recognized as a force which might act coercively and directly on the human will. In such societies, as also in the case of some Greek communities, where the only obligatory transaction was based upon an oath, the fact of duress would not normally be relevant. Taking an oath called into existence new forces which were quite independent of the human participants. An oath might indeed be disallowed by the god by whom it was sworn or by a counter-ritual but in scarcely any other way. The one who had compelled the oath might be punished without lessening the binding character of the oath itself.

The problem of duress was first solved at

Rome in a similar manner by a penal sanction against the person guilty of duress. The obligation created by it remained unaffected. Quite early, however, special provision was made that certain acts had to be done freely or willingly; it may be assumed that otherwise they had no effect. The law of Solon which made testamentary disposition possible gave validity to the disposition only if it had not been procured by magic, force or undue influence. It was the first clear known case in which an uncoerced will was itself a prerequisite of a valid transaction. Neo-Babylonian contracts expressly declare that they are entered into "to satisfy the heart" of the parties. Similar phrases are found in Greek contracts even before the fourth century. There are, besides, unequivocal statements in both Plato and Aristotle refusing all moral and legal effect to transactions entered into through force. There seems, however, to be no statutory declaration of the principle and no specific technical remedy by which redress may be obtained is stated. When written documents created a sense of obligation by writing alone, it was easy to preclude the question of duress by an acknowledgment in advance that the engagement was freely and voluntarily made. Evidently such an acknowledgment could itself be obtained by duress.

Duress is an important problem in criminal as well as in civil law. Not only may it inflict wrong but it may compel a man to do wrong. Long before a distinction was attained between what are now called the criminal and civil sides of legal administration, it had become apparent that not all doers of harm were equally guilty morally. Crimes committed under the threat of serious and immediate physical force are accordingly free from punishment in whole or in part, much as injuries done by accident or in self-defense. Indeed, the compelled crime is a sort of self-defense, since it implies that it is done to save the accused from injury, usually from death. Duress as a defense will therefore be inadmissible only when the legal system imposes a higher duty than that of self-preservation. An example is the pre-Talmudic Jewish law which allowed duress as a defense except in cases of murder, incest or idolatry. In these three crimes it was assumed that rather than commit them a man must be willing to die. The matter is still in doubt at the present time under special and exceptional situations. Nowhere in civilized countries today is duress a defense to a murder charge or to most crimes, unless the act is directed against the author of the force.

While the doctrine of physical duress has been widely recognized in criminal law, the significance of economic pressure has rarely been taken into account. During the Middle Ages, however, crimes against property could be excused by need: St. Thomas declared that for a starving man to take the property of another in order to save his own life was no theft. In modern times, with the greatly increased importance of private property, the use of economic duress as a defense in criminal accusations is regularly rejected, although it was occasionally admitted by radical courts such as that of the "good judge" Magnaud. It is likely, however, that where such duress is established it has a definite effect on the court even if it is theoretically treated as inadmissible.

In the field of contract the economic duress that consists in exploiting another person's necessities was the common rationalization of the popular opposition to usury in ancient and relatively recent times and was the basis of the principle of lesion in contracts which was introduced into the Roman law and which most civil law systems have adopted in a generalized form. In its simplest form it invalidates contracts of sale in which the seller has been forced to part with his goods at a price far below their "real value." The counterpart of this, the legal and moral objection to an exorbitant price by the seller, was not Roman but was introduced into European law during the Middle Ages with the doctrine of the just price and the violent opposition to forestallers and regraters. The action of employers who consciously exploit the economic necessity of their employees to their own advantage by reducing wages to the verge of subsistence was not until recently felt to be duress, nor could obligations assumed under such circumstances be lawfully repudiated. The doctrine that economic duress invalidates labor contracts has been greatly extended by the growth of labor organization and the spread of socialist theory; it has been made the basis of the right to strike and of the voidability of all labor contracts in the interests not only of the particular laborer but in the general interests of the labor organization to which he belongs. The great majority of jurists have never admitted this contention, however, and have treated the doctrine as an inexcusable attack upon contractual obligation.

In its more technical aspects duress had a very special history both at Roman law and at the common law. The publicity attaching to such transactions as the early will or conveyance left

little opportunity for duress, and the special importance of form made it impossible to suppose that even an extorted stipulation was inherently void. Protection had long been granted by the praetor against violent disturbance of possession, but it was apparently not until about 71 B.C. that a praetor first granted a penal action of which the effect was to neutralize the advantage obtained by duress. Shortly afterward duress became a defense in suits and ultimately the praetor permitted recovery of property or of the advantages surrendered under compulsion. In transactions requiring a definite act on the part of the person threatened, either to establish or to execute the contract, the Romans held that a choice made under duress was still an act of volition and had to be specifically set aside in order to be rendered invalid. Duress as a ground for the setting aside of wills was not known, for in addition to their publicity and formality wills could in most cases be revoked as soon as the duress ceased.

As to the character of the duress itself, the lawyers formulated the doctrine that the duress exercised must be such as to intimidate not a mere reasonable man but a man of especially firm character (*constantissimus*). In practice the duress recognized was similar to that acknowledged in other systems, and the Roman criterion was perhaps no more than a warning that the defense of duress must not be abused.

During the Middle Ages a doctrine of duress much less developed than the Roman was derived from Germanic custom. It was apparently confined to actual force or to threats of death or mutilation, accompanied by acts of physical torture. It was not until the tenth or eleventh century that the Roman theory, under which threat of a present evil of possibly diverse forms was sufficient, was gradually accepted.

To the canonists the question of duress was sometimes associated with the theological dogma of the freedom of the will, but the authority of St. Thomas was thrown on the side of the Roman doctrine. In the main the canon law jurists adopted principles which in their most general phrasing could easily have covered the broadest application of duress that has at any time been attempted.

The common law courts dealt precisely and sharply with obligations or transactions that were obtained by force. Bracton in the thirteenth century declared them void, borrowing the terminology of the Roman law. The *Year Books* furnish frequent examples of cases in which the

Duress

plea of duress was made and sustained. Chancery from the beginning offered concurrent aid to persons who had been forced into making deeds or surrendering property.

The question soon had to be centered on the type of duress employed. It is frequently asserted that the Roman rule as stated in Bracton was liberalized and broadened so that the test for duress changed gradually from that which would affect a brave man to that which would move the reasonable man. But it is difficult to see how the Roman rule as it appears in practice differed from the later common law rule as applied even in very recent times. Threat of death was certainly enough to invalidate a transaction in any system and apparently threat of imprisonment was sufficient, although there were contrary views on this point in early common law. It was clearly sufficient in Roman law. Force, however, that fell short of threats of death, mutilation or imprisonment was insufficient at common law and Blackstone states unqualifiedly that fear of battery was not duress. This, if anything, was a harsher standard than the Roman and it was certainly much harsher than that which had long prevailed in continental Europe. Ultimately, the value of this type of defense must rest not upon knowing what threats have been used but upon the evidence which the courts will demand before they will believe that these threats were effective. A sound instinct accordingly induced the Romans to drop the term force (*vis*) and confine the idea to the effect of the fear (*metus*). This change made it possible to give relief whether the duress had been caused by the party to the action or by a stranger, a result which the common law also reached after some hesitation and struggle, although in a somewhat limited form.

Duress of goods, involving merely threats against property, did not receive sympathetic recognition from the courts. If the threatened seizure or withholding of goods was wrongful, the party affected appeared to have legal redress and need not purchase security by incurring a new obligation; such redress, however, is in many cases illusory. Relief is frequently granted in both England and America despite the positive statements of earlier English cases to the contrary, and some of the instances of relief are quite early.

The present scope of duress has been extended to cover also such matters as abuse of legal process and threats of civil or criminal prosecution, even where a case could be made out for prosecution. Obviously bad faith must be demonstrated

in these cases and the courts will undoubtedly be chary of finding a malicious purpose where the act itself is lawful.

A type of duress known as "undue influence" has since the time of Solon been taken into account for certain transactions, such as wills. The extension of this idea to contracts generally would open up opportunities of contention that might place too heavy a burden on the discretion of the courts. But in equity relief from a bargain in which the other party has exploited his superior position has been allowed. The English courts, faced with the repeal of the usury laws, have relied upon this principle to invalidate grossly unconscionable contracts.

Obviously the idea of undue influence is hard to separate from that of the reverential awe or fear with which a son might regard his father or a servant his master. Both the Roman and the canon law refused to consider contracts in which this element entered as contracts made under duress, particularly when marriage was involved. In equity, however, where such contracts are for the benefit of the superior party they will be scanned with suspicion. At Roman law certain types of transactions, such as gifts made under suspicious circumstances, were void or partly void by the famous *Lex cincia*. The present tendency is to liberalize rather than to modify the attitude toward undue influence in these matters.

The whole idea of duress is intimately associated with the doctrine of the autonomy of the will, implicit in most legal systems and most clearly expressed in the French civil code. It is unfortunate that a legal doctrine should be made to depend on a sharply controversial issue of psychology or philosophy. If the elements of good faith and conscience are made parts of every contract the psychological state of the person making the contract will be less relevant than the desirability of readjusting every contract in accordance with the personal and social needs of all persons directly and indirectly concerned. The whole theory of contract and obligation would, however, have to be revised in order to make this adjustment. In any event, enlargement of the theories of lesion, unconscionability and exploitation will be necessary to secure a larger measure of justice in legal transactions.

That duress must vitiate all engagements predicated upon mutual consent seems almost axiomatic; and when international law was transferred from the sanction of ancient custom to that of the law of nature, the earliest exponents of the law of nature found it difficult to explain

why treaties, which were like contracts, were not voidable for duress. In the last analysis the only explanation was the reassertion of the traditional fact that they were not so voidable. Treaties which ended or averted wars were always made under duress unless the parties were and remained exactly equal. Expediency as well as tradition demanded the validity of these treaties; otherwise there would be endless war.

The doctrine that duress is inapplicable to international conventions has been challenged by writers on international law and the question has also been brought before international tribunals. The issue was raised in reference to the Tacna-Arica settlement in the treaty of 1883 between Peru and Chile and also in reference to the Chinese concessions made to Japan in 1915. Some theorists would confine the doctrine to the validity of the treaty so far as third parties are concerned; some hold that the extortion of an unjust treaty by threat of war does not result in an obligatory agreement. Evidently the effectiveness of such a principle depends upon the existence of a supporting international public opinion; should this exist, it would probably prevent the original wrong. A real sanction for either contracts or treaties will come only when there is an international machinery of enforcement or a uniformly recognized scale of moral values.

DURHAM, FIRST EARL OF, JOHN GEORGE LAMBTON (1792-1840), British statesman. Owner of extensive collieries as well as of large landed estates, Lord Durham was the main link between industrial middle class leaders and the landowning aristocracy controlling Parliament. Entering the House of Commons in 1813 he carried on the family tradition by aligning himself with the more liberal Whigs. His position in the party was strengthened by his marriage in 1816 to the daughter of Lord Grey. He soon became an aggressive leader in the parliamentary reform movement, urging the abolition of rotten borough oligarchy. Because of his prominence as an advocate of electoral reform he was appointed by Lord Grey chairman of the committee which prepared the Reform Bill of 1832. He successfully urged its more liberal provisions, which were modeled probably on an earlier bill that he had unsuccessfully introduced in Parliament in 1821. The masterly report which won the consent of the cabinet to the Reform Bill of 1832 was the work of Durham, and during the ensuing struggle he was the most forceful and consistent advocate in the cabinet of the successful policy of retaining all its essential features. In the period following the Reform Act his radical policies, which on such subjects as household suffrage, the ballot and religious disabilities anticipated many of the reforms of the succeeding generation, alienated the Whig leaders. This, combined with his uncompromising individualism, removed him from the active councils of the party and frustrated his chances of leadership.

Following the Canadian rebellions of 1837 he was sent in May, 1838, to Canada as governor, with a commission to investigate and report. Reversing the attitude of his predecessors he made a determined and successful effort to foster Anglo-American friendship. But he came to believe that the Melbourne government was not adequately supporting his administration and in November of the same year he returned to England. His famous report, presented to Parliament January 31, 1839, effected a revolution in the character of the British

Empire. It laid the foundation of an effective Canadian democracy and of the type of self-government which with its harmonizing of nationalism and imperialism prevails in the nations of the British Commonwealth. Its central recommendation—which was adopted partially in immediately succeeding years and fully under Elgin's governorship—provided that the governor's advisers must enjoy the support of a majority of the Canadian assembly (later House of Commons) and that no governor who found himself in conflict with the assembly should be supported by the mother country. This meant that British cabinet government would be introduced into Canada and that in matters of Canadian concern Canadians would enjoy the same degree of self-government as did British citizens. He excepted certain matters of imperial concern from the scope of Canadian self-government—foreign relations, foreign trade, public lands and the constitution. Durham probably foresaw that Canada would outgrow these restrictions, but he believed in the permanency of its connection with Great Britain. The imperialistic note was as strong as that of self-government. His recommendation of an immediate union of Upper and Lower Canada was carried out in 1841, while his suggestion of an ultimate union of all the British North American provinces was finally realized in 1867. His proposals for an adequate system of municipal government, substantial improvements in education and judicial reforms were all effected shortly afterwards. The greatest weakness of the report lay in its suggestion that French Canadians should be merged in a common British type of life.

CHESTER W. NEW

Consult: New, C. W., *Lord Durham, a Biography of John George Lambton, First Earl of Durham* (Oxford 1929), with bibliography, p. 577-97; Reid, S. J., *Life and Letters of the First Earl of Durham*, 2 vols. (London 1906).

DURKHEIM, ÉMILE (1858-1917), French sociologist and philosopher. He was born at Épinal of a family which counted rabbis among its members. He entered the École Normale Supérieure de Paris in 1879 at the time when Fustel de Coulanges was its director. After traveling in Germany, where he studied especially the tendencies of national economies, folk psychology and cultural anthropology, he con-

ducted a course in social science and pedagogy in the Faculté des Lettres at Bordeaux, where Alfred Espinas was teaching. Several years after the appearance of his thesis *De la division du travail social* in 1893 he was called to Paris to teach sociology and pedagogy. In 1898 he began the publication of the *Année sociologique*, to which he attracted many collaborators.

He was in France the successor of Auguste Comte in the field of scientific research, devoting himself more especially to moral sociology. His works are rich in factual content, statistical and ethnological. He declared that it was necessary to study societies before humanity; and returning to the tradition of Montesquieu, to whom he had dedicated his second thesis, he distinguished between the various types of social organization, each possessing its own system of institutions. The formation and functioning of these institutions, he held, should be studied as objectively as possible without consideration of the variables which one obeys, or thinks he obeys, when submitting to the constraint of the social systems.

Durkheim's reflections on the division of labor, of which he studied the moral function rather than the economic return, led him to distinguish two principal forms of mutual dependence (*solidarité*)—the one "mechanical," which demands uniformity, and the other "organic," which admits diversity. The progress of the division of labor, which itself results from the volume and increasing compactness of modern societies in which industry is predominant, reveals the fact that these societies are giving increasing importance to personality and are evolving toward a contractual and liberal regime. Durkheim did not advocate *laissez faire* but held that in order that the division of labor may produce the happy effect of social union individuals must be enabled to choose their occupations according to their true capacities, and the resulting balance must not be destroyed by inequality of wealth.

Durkheim's central theory is that of collective representation. He believed that a psychology of a special type must be established which will take account of the actions and reactions which individual consciousnesses exercise on each other and of the syntheses which are produced when the consciousnesses are united. Through these syntheses he explained religious beliefs, beliefs which are imperative because collective, the peculiar authority of value judgments, the tendencies of educational systems and the

formation not only of moral consciousness but of the categories of reason.

DURUY, JEAN VICTOR (1811-94), French historian and educational reformer. Duruy studied with Michelet at the École Normale Supérieure, where he was appointed professor after teaching for a time in the Lycée Henri IV. As a historian Duruy was chiefly important for his work in popularizing the study of ancient history and the history of France. His books, marked by sure scholarship and clear exposition, attained a wide vogue among students as well as the general public. His collection of historical manuals adapted for use in the *lycées* and colleges transformed the teaching of French history by adding to it the study of institutions, intellectual history and the history of art. In 1863 Napoleon III appointed Duruy minister of public instruction and in this position, which he held for six years, he distinguished himself as one of the greatest ministers of education that France has had. He continued the work of Guizot in connection with primary education by establishing 12,000 new schools; he organized school libraries and courses for adults. In the *lycées* and colleges, alongside the traditional humanistic program of education, he instituted courses based upon sciences and modern lan-

guages, specially adapted to young people entering industry and commerce. The supply of professors for this new instruction was insured—not without numerous protests—by the establishment of a new normal school at Cluny. In the field of higher education Duruy's importance rests on his establishment of the École des Hautes Études, which, equipped with special laboratories and libraries and with the teaching conducted in small seminars without the routine of a definite program or of regular examinations, encouraged research among the professors, gave the students a practical training and has been of the greatest service to French science and scholarship especially during the period before the reform of the universities in 1896.

DUTOT, CHARLES DE FERRARE (eighteenth century, exact dates unknown), French economist. Dutot was one of the principal officers of Law's Compagnie des Indes. His important work, *Réflexions politiques sur le commerce et les finances* (2 vols., The Hague 1738; reedited by E. Daire in *Économistes financiers du XVIII^e siècle*, 2nd ed. Paris 1851), is devoted to an analysis and justification of Law's system and to an explanation of the causes of its downfall.

Dutot is considered one of the best and clearest theorists of his time in the field of money and credit. He belongs to the group of neo-mercantilists with Forbonnais and Melon. Although influenced by the latter he did not always share his ideas. Dutot differed from Melon particularly in upholding the conception that money should be in itself a valuable commodity rather than a mere token. He thus attached great importance to the precious metals—not, however, for their own sake, as did the mercantilists, but because he considered them instruments for

the acquisition of wealth. In his analysis of the quantity theory of money he emphasized, before Cantillon, the importance of the factor of velocity of circulation. In his theory of credit he stressed the importance of paper money and looked upon credit as a genuine source of the increase of wealth, as a direct agent of production. Dutot may be considered a forerunner of the physiocrats, for he greatly emphasized the importance of rural wealth. Mention should also be made of his ideas on colonial trade and of his fiscal theories, which advocated the apportionment of taxes on the basis of the ability of the individual to pay.

DUTY. The concept of duty represents the most general acknowledgment of the dominance of the social environment upon the individual. The common name for this dominance is conscience. If one seeks the major significance of this term he will be led logically into a survey of the variety of things which have been supposed to be known as moral, into the variety of implications carried by the notion of duty.

The first reference of the term, if not also the most basic, derives from religion. To do one's duty is to obey the will of God as revealed through conscience. The jural implication of such an orientation of duty is easily seen in the fact that if one's conscience does not function to reveal what the ascendant voices of the time and place call the will of God he has his duty to do nevertheless. For constituted authority borrows prestige as the manifestation of the divine will for those who acknowledge the latter, and is made to serve as its substitute for those who do not acknowledge such sovereignty or who though acknowledging it have nevertheless found their direct channels of communication with it obstructed. And if a little "gentle violence," as Plato has it, must be used to get acknowledgment of the human substitute from those who have sacrificed fresh access to the celestial essence, it is to be easily overlooked in the interest of a larger totality of good. A famous expression of this universal indirection is John Cotton's reply to Roger Williams' complaint that he had been driven out of Massachusetts for following his conscience: not because you followed your conscience, ran Cotton's retort, but because you refused to follow your conscience in doing what you knew

to be right. Thomas Hobbes' more ingenious proof from the derivation of the word that conscience cannot be private but must be publicly in the hands of the sovereign (*Leviathan* ch. vii) exemplifies the same motif from a less theological but no less authoritarian angle. The theological interpretation recognizes an objective basis for duty and shows a wise clairvoyance for the social nature of this basis by dramatizing the source into a transcendent personality, whose voice is the soul's own portable oracle.

A little less innocence or a little more honesty, and the voice as content for duty gives way to principles that may be read at leisure by the dutiful. These may themselves take the form of intuitions impressed upon the soul and revealed by appropriate experience, as in the doctrine of innate moral ideas or in the Kantian categorical imperative. Or they may be "laws of nature" to be discovered through research and acknowledged as and when found. The stoic formula, "live according to nature," located the source of duty in a natural order, characterized the emotions as obstacles to its practise and regarded the continuous function of reason as the means to its discovery. Plato's doctrine of reminiscence, in so far as it was an ethical doctrine, mediated the anthropomorphic religious view of duty and the subsequent stoic impersonal interpretation of it. Conscience gave place to reason as the moral organ, and an active attitude began to supplant a typically passive one toward the problem of finding out what ought to be done. Socrates illustrates both attitudes, characteristically pursuing the moral argument wherever it leads him and yet at crucial times standing immobile for hours listening raptly to his "voice" telling him "what not to do."

The ambiguity of the concept "nature," as used by both stoics and moderns, has concealed under an acknowledgment of an outer guidance for conduct an inner willingness on the part of men to assist in the job of drawing specifications for their own action. This willingness is the more clearly revealed by the fact that the appeal to nature has been traditionally made, as Ritchie observes in his *Natural Rights*, by those to whom new occasions have already taught new duties. When humanitarianism awakening through the Renaissance wished to prescribe new limits to old states, the voice of enlightenment, notably in the person of Grotius, spoke compelling intimations to reluctant sovereigns from oracles of nature.

What dictated new duties to old sovereigns

from behind the disguised but stern sanctions of a rising democratic sentiment bespoke more palatable duties to the new claimants of sovereignty, i.e. to the freshly enfranchised citizens. Natural law stood back of natural rights; and natural rights were interests: life, liberty, happiness and, not infrequently (see Locke particularly), property. When the right is used to support rights that are clearly interests, a new interpretation of duty is indicated.

Utilitarianism supplanted the natural rights philosophy as the latter had slowly transformed religious philosophy. The entire process represented a sort of "transvaluation of values." In both the older views, but notably the religious one, the business of life was to do one's duty—duty derived from without and sanctioned by external pressure. With relation to another life duty indeed might lead one to the good; but for this life to do one's duty was the good. It had, nevertheless, been long noted that while duty might be the good, it did not always get one the goods. (When I saw the prosperity of the wicked, ran the old Hebrew psalmist's complaint, then my feet almost slipped.) In the rising modern world of multiplying rights and increasing efficiency the goods were destined to become the thing. "Good" as the common quality of all kinds of goods became naturally the basic ethical concept, and duty but a means to good(s) as the end. God might still be needed as an ultimate buttress for nearer social sanctions; but nothing more was needed to explain the notion and to constitute the fact of duty than a clear understanding and an adequate appropriation of pleasures and pains. Instead of crucifying the flesh, as in the religious view, or suppressing emotion, as in the stoic view, the modern mind not only acknowledges feeling as morally legitimate but constitutes of it the ethical ends to which duty is prudential means. Duty appears in such a milieu as the demand laid upon us to use our intelligence to maximize utilities and to minimize disutilities.

For such a perspective two problems remain: how to explain the esoteric aspect of the experience called duty and how to procure the maximum intelligence for the guidance of conduct. It is admitted that many if not all people have an inner stress and strain in directing and particularly in redirecting conduct. This experience of obligation, the sense of duty, seems in the having to be more than a merely difficult calculus of advantage. Utilitarianism and its contemporary affinities (behaviorism, prag-

matism, Freudianism) admit that it is more but deplore the "more." Such poignant experience as that historically connoted by the term duty, while all too common, is pure inefficiency, indicates lack of personality integration and betokens the hangover of authoritarian institutions, exacting external standards and ugly early experiences. The stern father, the repressive school, inhibitory public opinion—these are the tyrants of whom such a sense of duty is the natural but misbegotten child. "Conscience is the inside of custom," "conscience is the voice of the group sounding in the individual," "duty is social dominance masquerading as individual censor"—these are contemporary sociological explanations of the psychological sense of duty where it is more than a positivistic preoccupation over how to achieve this or that.

But all these, although explaining duty derogatorily, assume that it is a social derivative. The problem then presses as to the fruitful role of the social in the individual. The romantic age is passed when men dreamed of either abolishing institutions or fleeing them: as for flight, there is nowhere to go; as for abolition, the concept "social" is now widely held to be implicated structurally in the very notion of the individual. "When me they fly, I am the wings." Consideration of the concept of duty leads easily to a struggle against every form of authoritarian institution and to an unremitting insistence upon a completion of the democratizing process in family, in school, in church, in state, in industry. Men cannot do their duty until they no longer feel the sense of duty. Thus the dictum of Immanuel Kant that duty is not duty unless done exclusively for its own sake is completely reversed. To be intelligent in the adaptation of means to ends becomes, for such a point of view, the supreme human virtue. The chief thing, moreover, that stands in the way of universal intelligence is the presence of authoritarian institutions transmitting their influence through an educational procedure like themselves. The sense of duty is the last silent witness of a past which the sooner overcome and forgotten, the better.

The use of some such criticism of existing duties in the current Fascist and Communistic protests against bourgeois morality does not mean, however, that in a future made by Communists or Fascists the social determination of the individual would be less than in the past. It appears to mean only that while they remain effective without having the prestige of being

traditional this determination will be more frank, even if also more ruthless. But they clearly strive to become traditional and to substitute inspired education of the young for difficult coercion of the old. Moderates, who struggle against the old order but fear equally the dominance of new class conscious groups, still pin their faith to liberty democratically arrived at and still hope that subversion of authoritative institutions can be made to justify itself by diminishing authoritarianism. For those, descendants for the most part of nineteenth century liberalism, it remains a working faith that men are active by nature; that the common ends of activity are the only moral goals; that the cooperative quest for the most efficient means thereunto is at once the scientific and the ethical process; and that the only generalized duty is the duty to be uniformly intelligent.

DWIGHT, LOUIS (1793-1854), American penologist and philanthropist. Dwight prepared for the ministry at Yale and the Andover Theological Seminary but was early incapacitated for an active pulpit career because of a hemorrhage of the lungs, which he suffered from inhaling "exhilarating gas" at a chemical lecture. He became an agent for the American Tract Society in 1819 and for the American Education Society in 1823, but persistent ill health finally drove him to undertake a thousand-mile horseback trip through the south Atlantic states in 1824-25, distributing Bibles to prisoners for the American Bible Society. Shocked to the quick by the terrible neglect of

the prisoners and the grave abuses in the institutions, upon his return he founded the Prison Discipline Society of Boston, taking as inspiration the work of John Howard, the English prison reformer. As the guiding spirit of this society for the remainder of his life Dwight was chiefly responsible for the victory in the United States of the Auburn system of congregate work and dormitory cell isolation of prisoners over the Pennsylvania system of isolated cellular confinement at all times. His reports on imprisonment for debt were a leading factor in the abolition of this abuse, and he worked constantly for the segregation of the insane in hospitals rather than in prisons. The best source material on prison conditions in the United States in the second quarter of the nineteenth century is to be found in Dwight's annual *Reports of the Prison Discipline Society* (3 vols., Boston 1855). He also made an important report on the prisons of England and the continent as the result of a trip to Europe in 1846.

DYAKONOV, MIKHAIL ALEXANDROVICH (1855-1919), Russian historian. Dyakonov was professor of the history of Russian law at the University of Yuriev and later at the University of St. Petersburg; in 1909 he was elected member of the Russian Academy of Sciences. His works are concerned chiefly with the Moscow period of Russian history. *Vlast moskovskikh gosudarey* (Authority of Moscow kings, St. Petersburg 1889), based mainly on a study of the church literature, covers the history of Russian political ideas to the end of the sixteenth century. *Ocherki obshchestvennago i gosudarstvennago stroya drevney Rusi do kontsa XVII veka* (Essays on the social and political organization of ancient Russia to the end of the seventeenth century; Yuriev 1907, 4th ed. St. Petersburg 1912) is a university text remarkable for its clarity and compactness. *Ocherki iz istorii selskago naseleniya v moskovskom gosudarstve XVI-XVII vekov* (Studies in the history of the rural population of Muscovia in the sixteenth and seventeenth centuries, St. Petersburg 1898), a collection of studies on the several rural classes of Russia, is interesting for its contribution to the origins of serfdom. Upon a careful examination of sources Dyakonov

concluded that attachment to the soil, a gradual process extending over a century, was forced by indebtedness on the proprietary peasants and by fiscal considerations on the state peasants.

Although he was a student of Sergeevich, a brilliant historian of dogmatic jurisprudence and a legal historian by specialization, Dyakonov disliked juridical construction in history, preferring to study legal institutions in their social and economic context. Nor did he trust the broad generalizations of sociological history, maintaining that caution is particularly essential in Russian historiography because the source material is, for the earlier period, scant and, for the later period, unsystematized. His own work was always based on a minute first hand analysis of all available sources.

GEORGE VERNADSKY

Works: A bibliography of Dyakonov's works has been compiled by V. A. Grigoryev in *Russky istorichesky zhurnal*, 1921, no. vii, p. 26-30.

DYE INDUSTRY

EARLY DYE TRADE. Trade in natural dyestuffs is far older than written records. No locality has totally lacked resources for the satisfaction of the desire for color; the juice of fruits and berries and extracts from crushed flower petals, roots of herbs or bark of trees were among the earliest dyestuffs; and throughout the world today in isolated regions local dyers rely on just such materials, used according to traditional processes and individual skills, to produce a range of color often considerable.

Dyes were perhaps first applied to the human body. Caesar's blue streaked Britons, the henna fingered women and henna bearded men of the Orient and the rouged ladies of all times are witness to the appeal of the practise. Skins worn as garments must early have been stained with colors. The art of leather dyeing is well developed in modern Africa, as it was also in ancient Egypt. Most primitive peoples stain the grasses with which they weave their baskets or their garments, and the mineral earths are used to color cloths or skins as well as pottery.

But the number of dyeing materials that can be applied directly to cloths or fibers is limited, and many such dyes are extremely fugitive. A great advance in dyeing was made with the discovery of the use of mordants, substances which

have the property of fixing the dye upon the material to be colored. Alum is the most important, but many natural mordants exist in all parts of the world. Native dyers in Africa use an alkaline earth as a mordant and those in India and South America use the leaves and bark of certain trees. It was nevertheless a noteworthy advance which the Hindus made when they discovered, at least as early as 2000 B.C., the use of alum. The technique became the basis of a complicated dyers' craft not only in India but also in Persia and Egypt, to which countries it had quickly spread.

The development of dyeing was closely associated with that of two other arts, medicine and painting. The herbs and plants which were the dyers' chief materials were also in many cases the best known medicaments, and trade in the two was interrelated. On the other hand, the coloring matters used in dyeing could also become the basis of painters' materials; the scum of the dyeing vats was powdered and mixed with wax or the dyeing liquid was combined with gypsum, i.e. chalk, to form a lake. The palettes of Roman painters, like those of the early Italian Renaissance, were enriched by the multiplicity of contemporary dyestuffs.

Trade in dyes began as soon as the plants of any one locality were recognized as superior for dyeing. All over Africa today in the native markets bundles of bark or roots or sheaves of a kind of sorghum which has been cultivated as a dye plant in the Sudan for centuries are bartered or sold. Such commerce must have existed very early. But for some of the more important dyes, the very ones which entered later into world trade, the problem of producing a commercial product was more difficult. Indigoferae, or indigo bearing plants, for instance, are found widely distributed over America, Asia, Africa and the East Indies. Throughout most of the world men early knew how to use the water soaked leaves and stems of these plants to dye blue; garments found in the Inca graves of Peru and Chile as well as those in the early Egyptian tombs show traces of this color, and primitive African tribes still use it locally. But the commercial importance of indigo depended upon the discovery of methods of precipitating out solid indigo from the yellowish liquid of the plant, making it into cakes and then discovering methods of redissolving it, for the dried indigo is not soluble in water alone but requires the addition of some other agent. All this the Hindus learned to do very early and upon their skill was

based the very considerable indigo trade of antiquity. Knowledge of processes, however, did not always travel as fast as the material; the Greeks and Romans, although they imported considerable quantities of indigo, appear not to have known how to redissolve the cake for dyeing but instead powdered it and used it as a paint, the Roman *indicum*. It is not certain whether the early Egyptians dyed their garments with locally grown indigo or knew the use of the commercial product. In China for many centuries most cotton plantations were flanked by small fields of indigo, which was used to dye the material locally, and there was almost no trade in the dye.

Greater knowledge of the Aztec civilizations may reveal the existence of an important trade in dyestuffs throughout the Americas. A variety of materials are available and are known to have been used: a native indigo, logwood for black, brazilwood for red, the cochineal for crimson, several herbs for yellow. A species of shellfish similar to that obtained from the Mediterranean and giving the famous Tyrian purple is found on the coasts of Central and South America and has been used by the natives for centuries. The art of dyeing was highly developed by the early Aztecs, but not until the Spaniards carried away cochineal in the sixteenth century did it have any appreciable effect on the rest of the world.

The great center of the dye trade and industry in the ancient world was India. The Hindus not only made indigo into a commercial product but developed the art of calico printing—the dyeing of one piece of cloth many colors either through the use of different mordants or through waxing and repeated dipping. This technique traveled eastward to Java, where it developed into the famous Javanese batik work, and westward to Egypt, where Pliny saw and described it with wonder.

In addition to a wide variety of vegetable dyes the craftsmen of India, Persia and Egypt used several important insect dyes. Kermes, the scarlet of the Old Testament, was made from insects found on a species of oak growing around the eastern shores of the Mediterranean. When dried and dissolved in an acid the insects gave shades of scarlet, crimson or purple according to the mordant used. Very similar are the lac dye of India made from an insect which lives on fig trees and the cochineal of Mexico. Lac dye was early and extensively used in India and Indo-China and was the center of a flourishing trade throughout the East for many centuries, although

it was not introduced into Europe until the thirteenth century. Kermes, on the other hand, seems to have been introduced into commerce by the Phoenicians. The insects, long growing wild throughout Persia, had apparently been early cultivated by the Persians and later by the Armenians. Pliny says that in his time the insect, which the Romans called *coccum*, was grown in Galatea, Africa, Pisidia and other places, while Spain discharged half her tribute to Rome through the exportation of the *coccum* grains. Kermes was one of the few dyes knowledge of the use of which did not disappear in early mediaeval Europe: the reds of the Gothic tapestries were dyed with it.

The Phoenicians also introduced into commerce the most famous of the dyes of antiquity, the Tyrian purple. This crimson purple stain was made by a fluid, chemically similar to that of indigo, from certain mollusks which are found in abundance along all the shores of the Mediterranean and as far north as Britain as well as on the coast of Central America. The use of this dye had been known since about 1500 B.C.; it was probably used by the Minoans, but it was the Phoenicians who developed it into an important dye, and Tyre and Sidon remained the centers for the finest dyed purple cloths. The fabulous price of the Tyrian purple, in so far as it was not a monopoly price, resulted from the fact that considerable labor was required to extract the fluid from the tiny mollusks. Poorer qualities of the dye could be made by drying and grinding the mollusks, but the best color was produced by an immediate application of an aqueous solution of the liquid. Trade therefore was not in the dye, but in dyed cloths or wool. In addition to Tyre and Sidon there were less opulent centers for the dyeing of the purple all around the shores of the Mediterranean. The Phoenicians appear to have carried knowledge of the process even to Britain, where it survived in isolated regions as late as the seventeenth century. The use of the purple had at first been restricted to a limited class by its cost if for no other reason, but the influx of wealth into Rome in the first century B.C. made possible a great extension in its use. Combined with madder or kermes or archil (orchil), a lichen dye, it became so common that the later emperors sharply restricted its use. In the Eastern Empire the privilege of dyeing purple was confined to a very small group of craftsmen; it is therefore not surprising that after the downfall of that empire knowledge of its use should have been com-

Encyclopaedia of the Social Sciences

pletely lost. Mediaeval scholars even doubted its existence. The nature of the dye was rediscovered in the eighteenth century through the curiosity and persistence of a group of chemists, but not until 1906 was its exact chemical constitution ascertained.

The Greeks and Romans had as dyestuffs not only the Tyrian purple and the materials brought from the East but also a wide variety of local products. For yellow they used saffron, the common crocus, which produced a beautiful if fugitive color. For blue they had woad, a plant native to western Europe which yields a coloring matter chemically identical with that of indigo but of a very inferior quality. For red they had, in addition to kermes, madder, known for centuries all over the Near East.

The collapse of the Roman Empire shut off for a time the dyes of the East from Europe. Even the cultivation of madder declined and the native woad was the one dye that continued to be of importance in trade. Northwestern Europe has always been poor in coloring matters. For many centuries the chief dyes of Ireland, Wales, Scotland, Norway and Sweden were lichens, giving chiefly very dull crimson or brownish red colors. But the people of Sweden had learned to prepare from a species of lichen a very beautiful bright crimson which gave a different character to their textile art. The bright reds of Russia and northeastern Europe came from an insect similar to the kermes, in which there was some trade north and eastward throughout the Middle Ages.

During this period the center of the dye trade shifted again to the East, where it continued to be an important element of commerce. The great market for indigo was Bagdad, to which the dye was brought from India and Persia over the regular trade routes and from which it was shipped out again to Alexandria and Constantinople. Calcutta and Cambay were the chief eastern markets for lac, which found its way into Europe somewhat later through Aden and Alexandria. Madder was cultivated quite widely, but toward the end of the Middle Ages the madder of Georgia was so highly valued that it was sent all the way to India, probably down the Caspian Sea and then overland.

This rich knowledge of the East slowly seeped back into Europe again. The Moors revived the cultivation of madder in Spain; the crusades and the growing trade of Venice and Genoa led to the borrowing of skills and materials from the East. Venice was for a time not only the most

important European market for dye materials but famed for the superiority of her dyeing industry. The kermes dye was for years known as Venetian scarlet, because the skilled craftsmen of that city continued to use it on fine goods long after it had been displaced throughout the rest of Europe by the cheaper cochineal from America. In the fourteenth century Florence enjoyed the monopoly of archil, the violet dyeing lichen, knowledge of the use of which was brought back from the Levant by a merchant named Federigo who founded one of the principal Florentine families, taking the name Oricilarii—later Rucellarii or Rucillai—from the dye. He was able to secure all of the lichen which grew on the shores of the Mediterranean and thus monopolized the trade until the discovery of the Canary Islands in 1402. About 1730 archil was discovered growing on the Cape Verde Islands and became an even more important article of European commerce.

Italy for a time possessed another advantage in her ability to secure alum for use as a mordant. Throughout the early Middle Ages Europe was dependent on the East for alum, which was one of the most prized objects of commerce. Constantinople and Alexandria were the chief markets for the product, which was brought from such distant places as Upper Egypt and Arabia. When the Turks captured Constantinople they seized the alum mines near that city and for a time disrupted the trade. The difficulty was solved for Italy in the discovery, by a Paduan who had lived in Constantinople as a dyer until the arrival of the Turks, of alum rocks at Tolfa near Civitavecchia. This man was at the time in the service of the pope, who thereby came into possession of the mines, working them to his great profit. In spite of the fact that the pope declared purchase of alum from his mines a Christian duty and threatened with excommunication anyone who bought from the Turks, the price of the Turkish product was so much lower that it continued to be imported. Eventually the discovery of other mines in northern Italy and France broke even the semimonopoly enjoyed by the pope.

One after another the major dyes of the Orient were brought into Italy and gradually found their way into Flanders, Holland, France and England. In 1516 the Dutch began to bring indigo around the Cape of Good Hope, and early in the sixteenth century two important new dyes were introduced from America: cochineal and logwood. The latter produces an un-

usually true black and is one of the few natural dyes which is still of commercial importance.

Supplying this extensive dye trade was a series of more or less well developed industries which had changed little in character over a period of centuries. Marco Polo describes great indigo plantations which he saw in India. Probably these plantations as well as the plants where the paste was made were run by semiservile labor, much as were the plantations later developed in India by the East India Company. The gathering and drying of the kermes insects was organized by merchants on a large scale; an old German manuscript gives an interesting picture of the leasing of their lands at certain seasons of the year by the great landlords of Poland and the Ukraine to the Jews who gathered, for sale to the Turks, the similar insect which is found throughout eastern Europe. The gathering of cochineal was a profitable business.

As the new dyes were introduced into Europe they met opposition in many cases from the producers and dyers of the older colors. Indigo in particular was opposed as a foreign product far inferior to woad; in Germany the guild of woad dyers for a time succeeded in preventing its importation, and in France from 1669 to 1737 regulations forbade its use except in combination with far greater quantities of woad. Not only mercantilistic policy but also the attitude of the guilds underlay such restrictions.

The use of dyes developed into a separate craft very early. In primitive times dyeing was practised largely by the women who prepared the skins or wove the cloth, but as the use of certain colors took on a ritual significance and as craft skills developed, dyeing became specialized in certain families, then in guilds. In India dyeing developed as a special profession very early; since the Mohammedan conquest most of the dyers have been Mohammedans. The dyers' craft was well organized in Rome, where a special quarter of the city was set aside for their use. Throughout the Levant each city had its dyers' guilds and considerable specialization had occurred by the eleventh or twelfth century, with certain dyers dyeing blue, others red, still others black. The *Arabian Nights* tale of Abu Kir and Abu Sio presents a humorous picture of a city in which all of the dyers had forgotten how to dye any color except blue, although their market was supplied with other dyes, and of the difficulties encountered by a foreigner who wished to set up a dyehouse for all colors.

Dyers' guilds appeared in Italy at least as early as the thirteenth century. In Germany there were guilds of black dyers in the fourteenth century. In 1472 a company of dyers was incorporated in London. An interesting picture of the type of specialization which developed in most countries is to be found in the regulations of French dyers issued by Colbert in 1669 (*Instruction générale pour la teinture des laines et manufactures des laines de toutes nuances, et pour la culture des drogues ou ingrédients qu'on emploie*). In order to improve and standardize the technique of the craft this document first gives instructions for the preparation and use of all the important known dyes; it then divides the dyers' guilds into those of the *bon teint*, who dyed madder, cochineal, woad and other bright colors, and those of the *petit teint*, who dyed black goods first woaded by the dyers of the *bon teint* and who were also allowed to dye poorer qualities of goods with cheaper dyes. To prevent adulteration neither group was allowed to have in its possession certain specified dyeing materials used by the other. Not until 1737 was this regulation voided.

Other expanding national governments of Europe early took an active interest in the dye trade and attempted to secure for themselves monopoly positions. The Spaniards had observed the use of cochineal by the natives of Mexico upon their arrival there and reported its beautiful color to the Spanish ministry, which ordered Cortés to take measures to multiply it. The Spanish adventurers seem to have left its actual care to the natives; nevertheless, by 1587 a single flotilla is reported to have brought to Spain 141,750 pounds of fine cochineal. The trade developed in importance after the accidental discovery about 1630 of methods of mordanting cochineal on tin, thus heightening its color considerably. This method was first practised at Leyden; a Flemish painter learned the secret and communicated it to the Gobelines at Paris, while another Fleming carried the knowledge to England. The new dye so gained in popularity that the old and flourishing trade in kermes was completely disrupted. Various efforts were made to break the Spanish monopoly of the cochineal trade; in the latter part of the eighteenth century a Frenchman managed to smuggle some cochineal insects from Mexico and grow them in Santo Domingo, but this never became an important source of supply. About the same time the East India Company attempted to raise cochineal in Bengal, but for

some years trade ran in the other direction—cochineal was carried from America to Asia by way of the Philippines.

There was also a sharp trade rivalry in indigo. The Spanish and Portuguese had learned to know the plant in India and recognized it growing wild in Mexico and Brazil. Both began to cultivate and manufacture it there for importation into Europe. Later the French and English cultivated it in their colonies, and in 1774 the French exported from the island of Santo Domingo alone 2,350,000 pounds of indigo, while in 1773 the English exported 1,107,000 pounds from South Carolina. These sources were rapidly outstripped in importance by India. In 1792 the importation of indigo at the East India House in London was only 582,000 pounds; by 1807 it was 5,154,000 pounds. Throughout most of the nineteenth century there was sold in the European market indigo from India, Java, Manila, Egypt, Senegal, Guatemala, Mexico, Brazil, South Carolina and the Antilles. The most esteemed varieties were those from Bengal, Java and Guatemala.

The increase of wealth and leisure and the development of the textile industry fostered the demand for new and more brilliant dyes. In every country eminent scientists began to experiment with improved methods. As early as 1644 Sir Robert Boyle had presented to the Royal Society the results of certain experiments on colors, but little came of his efforts. In France, Colbert encouraged many scientific as well as practical experiments. In 1666 he introduced madder into Avignon, and for the next two centuries French scientists were busy attempting to improve the cultivation of madder and woad. The chief chemical constituent of madder, alizarin, was isolated in 1826, and thereafter several commercial preparations of madder were made; for example, garancine, made by treatment of the root with sulphuric acid. About the same time the artificial production of ultramarine, hitherto made from powdered lapis lazuli, introduced a new blue dye and founded a new industry.

Throughout the latter half of the eighteenth century a vast amount of research was devoted to attempts to discover, often for purely theoretical purposes, the chemical constitution of the important dyes. Such experiments as well as the whole complicated dye trade and the industries upon which it was based were brought to an end with dramatic suddenness by the discovery (1856-1900) of the use of coal tar for

synthetic dyes. The natural dyes could not compete with the new ones, which were not only far cheaper and in many cases brighter but were far more uniform in color and required therefore much less skill in application. Ten years after the synthesis of alizarin the world production of madder, which had been about 70,000 tons a year, had completely disappeared, and large regions of France which had specialized in its production were ruined. In 1896 indigo was cultivated on more than 1,600,000 acres in India; by 1906 only 450,000 acres were under cultivation and the prosperity of Madras was gone.

It was some years longer before the synthetic dyes of England and Germany began to displace the natural dyes in India, China and Africa; but even before the World War this displacement had begun and it is continuing at an increasingly rapid pace. In 1924 China was the largest consumer of synthetic indigo next to the United States. Throughout India the dyers' guilds have been disrupted and the customary economic basis of life in many districts has disappeared with the introduction of cheap aniline dyes. Only in isolated districts can one find the old knowledge and the old skills in dyeing. During the World War, when dyes from Germany were cut off, the countries of western Europe and the United States attempted to utilize natural dyes; they failed to apply them successfully, largely through lack of craft knowledge, and with the end of the war turned again to the synthetic product.

Throughout most of the Orient the introduction of cheap synthetic dyes has brought a marked deterioration in quality. The packaged dyes can easily be used by anyone, and the old skills are no longer necessary. With this loss of skill in dyeing has gone a deterioration in the quality of the textile products. Expertness in dyeing was the secret of the value of the early Indian cottons, as of many of the fine China silks. The two have perished together. A few belated attempts have been made to preserve the older crafts, such as the Persian regulation against the use of aniline dyes for Persian rugs. The fine batik work of Java, now done by the natives under the direction of Chinese or Dutch entrepreneurs, is still based on use of the natural dyes. But except in isolated regions and for certain conscious art and craft purposes the use of natural dyes seems destined to disappear as the dye trade has already disappeared.

IDA CRAVEN

MODERN DYESTUFFS INDUSTRY. A laboratory discovery gave birth to the modern synthetic dyestuffs industry; mankind's quest for color found its goal in a barrel of tar. Chemists had been attempting for a century to analyze the natural dyestuffs, and in 1845 a chemical product, picric acid, had been used as a dye; but the distinction of having founded the coal tar dyestuffs industry belongs to W. H. Perkin. In 1856, as a student at the Royal School of Mines in London, while endeavoring to secure quinine from aniline, he produced an unexpected purplish substance, mauve. He saw its possibilities as a dye and set up a plant for its manufacture.

The most outstanding technical characteristic of the industry thus founded—and one which has continuously influenced the evolution of its industrial structure—is the fact that it is based on complicated chemical reactions all involving minute chemical control. The chemical processes basic to the industry at the present time may be illustrated diagrammatically: coal (1 ton) → coal tar (140 lbs.) → 5 crudes important for dyestuffs (benzene 1 lb., toluene .9 lb., anthracene .3 lb., phenol .6 lb. and naphthalene 9.6 lbs.) → 300 intermediates → 1000 dyestuffs → 5000 brands of dyes. These coal tar crudes also yield rubber accelerators, camphor substitutes, germicides, insecticides and flotation compounds for the concentration of ores. The intermediates also make possible more than fourscore medicinal chemicals, a similar number of perfume materials, a dozen synthetic flavors, several artificial resins, tanning materials and photographic chemicals. Four of the dyestuffs—indigo, sulphur black, direct black and alizarin—account for roughly one half of the quantity and one fourth of the value of all dyes manufactured. Less than 5 percent of the modern dyes are produced in quantities exceeding 100 tons and less than 10 percent in amounts greater than 10 tons. The rest are produced on a poundage basis. All involve painstaking and sometimes highly skilled labor. A single dye usually requires from ten to eighty times its weight of raw materials and involves scores of separate operations, the unit processes—chlorination, caustic fusion, alkylation, liming, carboxylation, reduction, nitration, sulphonation, oxidation, condensation, diazotizing and coupling—being repeated many times.

The history of the industry consists of a succession of solutions to technological and economic problems. The technological history of coal tar dyes can be reviewed from the standpoint of their source materials (as aniline, anthracene,

phenol, naphthalene), their structure (as azo, sulphur, indigoid, anthraquinone) or their manner of application (water or spirit soluble, calling for acid or basic bath, direct or requiring mordants, developers or resistants, vat dyes and the like). In similar fashion the economic history of the industry can be surveyed from the point of view of the changes in its location (first England and France, then Germany and Switzerland, finally dispersed), its structure (single commodity, small plant as contrasted with joint cost, international monopoly) or its institutional interrelationships (as with patent, technical education and tariff systems). The selection of the years 1871, 1900 and 1915 as dividing marks in the variegated stream of dyestuffs development is thus wholly arbitrary.

The first period, from 1856 to 1871, may be called the rosaniline period, for it was from aniline that Hofmann and his pupils Perkin, Lightfoot, Medlock and Nicholson developed the first dyestuffs. It was an epoch of empirical individual experiment, although the fact that Graebe and Liebermann in 1869 succeeded in patenting a synthetic alizarin process just one day earlier than Perkin was a harbinger of the ultimate triumph of mass research. It was the era of English dominance, albeit under the aegis of a German professor and with the substantial contributions of other German chemists such as H. Caro (discoverer of the first successful azo dye, Bismarck brown, in 1862) Griess and O. Witt. Finally it was a period of single commodity production—first mauve, then magenta (invented by Verguin 1859), and in the early seventies alizarin.

In the second period, from 1871 to 1900, with dramatic suddenness the dyestuffs industry shifted to Germany. In 1872 German production of alizarin outstripped that of England. Perkin estimates that in 1878 the value of German dyestuffs production was £2,000,000, English £450,000, French £350,000 and the Swiss £350,000. Other indicia of the developments in Germany have been summarized in Table I.

Numerous reasons have been given for the transfer of the industry to Germany. The lack of a patent law there until 1877 was undoubtedly a factor. The return of Hofmann and Caro, who became the guiding genius of the huge Badische concern, and the close interrelation of university and industry so that the majority of dyestuffs manufacturers were professors—mostly pupils of Liebig, Hofmann and von Bayer (the latter first synthesized indigo in 1880)—were important. In English banking and industrial circles

TABLE I

SYNTHETIC DYESTUFFS INDUSTRY, 1856-1910

YEAR	DYESTUFFS PATENTS GRANTED IN ENGLAND (FOR QUINQUEN- NIUMS ENDING IN THE YEARS INDICATED)		NUMBER OF EMPLOYEES OF THE BADISCHE ANILIN- UND SODAFABRIK	EXPORTS			
				QUANTITY (in metric tons)		VALUE	
	TO GERMAN INVENTORS	TO ENGLISH INVENTORS		GERMAN	SWISS	GERMAN (in 1000 marks)	SWISS (in 1000 francs)

at this period the words academic and theoretical were sarcastic epithets connoting inefficiency. German scientists had huge laboratories and used them for the patient prosecution of research—the commercial production of indigo, for example, involved an expenditure of \$5,000,000 on research lasting from 1880 until 1897. The superb German chemico-technical schools were after 1870 almost wholly supported by the state, so that in Berlin in 1876 only 10 percent of the expenditure for chemical instruction was financed by the student. The German dye industry was favored by the existence of an intellectual proletariat; in 1900, for example, 84 percent of the technical and sales staff of the German dye companies were found to possess some formal training in chemistry whereas for England the figure was only 31 percent. Finally, one must take into account the eminent suitability of the Rhine River for a dyestuffs industry, particularly after the war of 1870 had made it safely domestic, not only as a connecting link between low cost sources of the many necessary raw materials but also as a purveyor of abundant supplies of pure water. The important Swiss industry at Basel, although based, as was the German industry until 1885, upon imported coal tar crudes, is generally accounted for upon similar grounds.

The second period was an era of systematic experimentation in molecular dyestuff architecture according to the blueprint furnished by

Kékulé (benzol theory, 1865). Thus the extremely important azo (Congo red, Böttiger, 1884) and sulphur (sulphur black, R. Vidal, 1894) classes of colors were developed. It was an epoch of joint cost production leading into such wholly new fields as pharmaceuticals (Knorr, antipyrin, 1883; Baumann, sulphonal, 1886), flavoring extracts (Tiemann and Haarmann, vanillin, 1876), perfume materials (musk or trinitrobutyltoluene, Baur, 1890) and photographic chemicals. All the important natural dyestuffs except indigo were displaced. The French production of madder declined from 25,000,000 kilograms in 1872 to 500,000 kilograms in 1879. Meanwhile the prices of all dyes sank rapidly; alizarin, for example, quoted at 270 marks per kilogram in 1869, fell to 23 marks in 1878 and to 1.78 marks in 1908.

In the third period, from 1900 to 1915, a dramatic end was brought to the centuries old indigo trade. The area planted in India decreased from roughly 1,600,000 acres in 1896 to 300,000 in 1912. Meanwhile German exports of synthetic indigo increased from 1364 tons in 1899 to 24,827 tons in 1912. It was a creative epoch; specialty dyes of exceptional fastness to light, washing and perspiration were sought, rather than new colors. Beginning in 1901 with Bohn's discovery of indanthrene blue, the first of a series of fast vat dyes from anthraquinone, patent activity increased with amazing rapidity. Of the 819 patents for organic colors granted in the United States in the period from 1900 to 1910,

685 were given to German inventors, 113 to Swiss, 9 to American and 5 to English.

The period was marked, furthermore, by a growing uneasiness in other countries than Germany about the dyestuffs situation. German production began to be concentrated in less than a half dozen large plants—in 1907 two of them employed 6519 workers of a total of 9071 employed in the whole industry. Ludwigshafen, Leverkusen and Höchst became veritable self-contained baronies, each with hundreds of chemists, elaborate housing developments and the like. Cartel agreements were succeeded by amalgamation of the largest companies into communities of interest. Two such communities of interest were formed in 1904, each uniting three large companies; relations between them, while at times strenuously competitive, became none the less increasingly closer until in 1916 they agreed to exchange technical information and to establish common prices and sales policies. By definite merger in 1925 the present *Interessen-Gemeinschaft Farbenindustrie* was formed. In an age of trustophobia, such agglomeration naturally aroused apprehension. In addition, however, the Germans established foreign branch factories and sales offices, partly in order to give direct technical service to the dyer, partly because of tariffs, as in the case of Russia and France, and in part because of legislation, as that of England in 1907, providing for speedy lapse of patents unless they were worked. Their commercial policies, such as full line forcing, overcame competition everywhere, in Germany as well as abroad; but in a period of nationalistic suspicions these appeared to be the methods of expansionist imperialism, while in the notorious Schweitzer episode the foreign dyestuffs subsidiaries were even alleged to be agencies of the military intelligence service.

The extraordinary services which the German dyestuffs industry was able to render its government during the World War are well known. The *Interessen-Gemeinschaft* produced in 1918 approximately 2000 tons of explosives and 750 tons of gases per week. Parts of the Leverkusen plant, for example, were converted to military purposes in six weeks. The materials and processes for making Congo red were the same as those required for T.N.T. (trinitrotoluol) or tear gas (brombenzyl cyanide). Similarly, a slight variation in the process for making sulphur black yielded the explosive picric acid. Chlorine, phosgene (Kern, 1883) and mustard gas (dichlorodiethylsulfide, Victor Meyer, 1886) had been

handled for decades in Germany. Other countries, having no such skilled labor, had to rely on slow and costly improvisation.

The salient feature of dyestuffs development since 1916 has been the growth of a domestic industry in the United States, England, France, Italy and Japan. Each of these supplies at present on the average 90 percent of home consumption. They grew up, of course, almost altogether as a result of war measures. In the United States, for example, more than 4500 German patents seized during the course of the war by the Alien Property Custodian were sold in 1918 for the ridiculous price of \$250,000 to a special licensing corporation organized by producers and consumers, the Chemical Foundation. The industry in the United States was protected after the war first by an embargo and subsequently by a tariff, amounting in 1926 on the average to 86 percent *ad valorem*. In England and France the government organized special corporations which took over the German branch factories and regulated the importation of the dyes which by the Versailles Treaty Germany was compelled to turn over to the Allies on reparations account—one half of its stock of dyes and one fourth of its output for a period of five years. These payments did not fully cease until 1928. Since the war licensing arrangements, tariffs, subsidies and similar aids have been liberally granted, even in free trade England. Most of the dye producing countries have become exporters; the United States, characteristically enough, specializes in indigo and other dyes of large volume and low unit value, while such a country as Switzerland exports expensive vat colors. The development of the industry since 1928 is epitomized in Table II.

A second feature of extraordinary international importance has been the growth of huge national monopolies. In every country the presence of substantial excess capacity, severe competition and the economics of avoiding duplication in research, of exchanging patent and process information, of integrating operations all the way from securing the various raw materials to marketing the thousands of products, and of consolidating sales agencies, have brought about cumulative concentration. In Germany a more solidly organized *Interessen-Gemeinschaft*, in England the Imperial Chemical Industries, Ltd., organized in 1926, in France the *Établissements Kuhlman*, and in the United States such giant concerns as the Allied Chemical and Dye Corporation, organized in 1920, and E. I. du Pont

Source: Production figures for 1913 adapted from C. Ungewitter, "Monograph on the Chemical Industry" in *The Chemical Industry*, International Economic Conference, Documentation, League of Nations publication, 1927, II. 4 (Geneva 1927) p. 28; production figures for 1928 and export figures adapted from United States Tariff Commission, *Census of Dyes and Coal-Tar Chemicals* (1929) p. 148 and 144.

de Nemours, Inc., not only control from 75 per cent to 100 per cent of the domestic production of dyestuffs but generally monopolize the synthetic fertilizer, rayon, organic solvents, explosives, alkali, acids, pharmaceutical and electrolytic chemical markets as well. Each of these giant concerns has branch factories and sales agencies spread out over the face of the earth.

International competition in dyestuffs, as in several other chemical products, has thus become a conflict of commercial "great powers." There has been a growing tendency, however, for a drawing together of these great opposed concerns. An important step in this direction was the Franco-German dye agreement signed in November, 1927, for a period of two years, extended in 1928 for five more years and superseded in April, 1929, by an agreement between Germany, France and Switzerland for the formation of an international cartel controlling probably 70 per cent of the world production of dyes. By this agreement prices were fixed, export quotas established and provisions made for the exchange of technical information and for the joint use of sales agencies. In such ways the consuming markets of the world are divided by a militant diplomacy that operates almost as precisely as it did in the partition of Africa and

China. During the French and German dyestuffs negotiations of 1927, for example, both governments were in constant conference with the financial plenipotentiaries. After the latter had been allowed to draft in substance the vital sections for chemicals in the tariff agreement both the commercial treaty and the private protocol were signed. The principle battlefield for foreign trade is at present the Far East. Among the European producers Germany holds the dominant position there, but the United States is becoming an increasingly formidable rival. The French export mainly to Spain, South America and the French colonies.

The dyestuffs industry furnishes a classic example of the economic and social changes which constitute the chemical phase of the industrial revolution. It has opened the way for increasing returns in scores of ways—by providing dyes at a small fraction of their former cost, by making them available in a wide range of color and quality, by setting free millions of acres of land for other uses and by making valuable an offensive waste. It has revolutionized the dyeing industry and brought about numerous changes in the design of chemical engineering equipment, for example autoclaves, filter presses and fractioning columns, that have proved useful in

a number of other industries. It has stimulated production of contact sulphuric acid and synthetic nitrogen. It has disrupted with dramatic suddenness age old arteries of commerce and created the uncertainties of intercommodity and interprocess competition. In making cells visible by staining, it made possible the isolation of various disease germs, such as those of tuberculosis and sleeping sickness, and devised such remedies as aspirin, salvarsan and diphtheria serum. It has developed large research laboratories equipped with exhaustive chemical libraries and hundreds of highly trained chemists. It has compelled joint cost production and the growth of international enterprises manufacturing hundreds of products and selling them under procedures similar to those of international arbitration. In peace and in war the worker has been injured and sometimes healed by dyestuffs products. Finally, it has made imperative, if the genie of chemical and particularly dyestuffs knowledge is to render maximum service to humankind, the abandonment of *laissez faire* and the increase of unified cooperative control by government, university and industry.

EATON, DORMAN BRIDGMAN (1823-99), American lawyer and civic reformer. After graduating from the University of Vermont in 1848 and from Harvard Law School in 1850 Eaton assisted Judge William Kent in preparing the eighth edition of Kent's *Commentaries*. In 1851 he was admitted to the New York bar. He retired from active practise in 1870 after a murderous assault by unknown persons and devoted the remainder of his life to civic reform. Eaton made many contributions to the improvement of municipal government, especially in New York City. He drafted the New York City Health Law of 1866 and served as counselor to the Metropolitan Board of Health from 1866 to 1870. He was instrumental in the reorganization of the fire department and the organization of the department of docks in 1870 and the establishment of civil magistrates in 1873.

Eaton is chiefly remembered for his long association with the merit system. His contacts as lawyer and citizen with the municipal government of New York under Tweed and with the operations of the buccaneering railroad magnates of the sixties gave him ample cause for joining the small band of leaders who sought the purification of American public life through the merit system, an interest confirmed by a visit to England in 1866. He served as chairman of the national Civil Service Commission from 1873 to 1875. Two years later President Hayes

invited him to investigate contemporary English civil service reforms. The result of this investigation represents the best known and most influential of his writings. Eaton assisted in the formation of the New York Civil Service Reform League in 1877 and of the National Civil Service Reform League in 1881. He drafted the legislation which established the United States Civil Service Commission in 1883, and became its first president. He may well be called "the legislative architect of the reformed civil service in the republic" of the United States.

EBBINGHAUS, HERMANN (1850-1909), German psychologist. Ebbinghaus taught psychology at the universities of Berlin, Breslau and Halle. He won his fame through his epoch making original experiments in 1885 in the field of memory, which paved the way for a host of related investigations. He also devised the so-called completion or combination test which requires the examinee to fill in omitted letters and words—a test which has been incorporated in a revised form in current mental tests.

Ebbinghaus' psychological system included much of what would now be called social psychology. Almost a fifth of his *Abriss der Psychologie* (1908), the only complete outline of his psychology which he himself prepared, is devoted to such questions as conduct, morality, religion, art and ideals. He was prevented by a premature death from bringing his labors to a definitive point. Yet he was able to systematize his science in his *Grundzüge der Psychologie*, which Wundt's encyclopaedic *Grundzüge der physiologischen Psychologie* surpassed in details but not in form and clarity. Ebbinghaus' *Grundzüge* can be compared only with James' *Principles of Psychology*. In 1890 he established with Arthur König the *Zeitschrift für Psychologie und Physiologie der Sinnesorgane*, which is probably to this day the leading German psychological periodical. Shortly before his death he assumed

the editorship of a series of volumes by specialists under the general title of *Psychologie in Einzeldarstellungen*.

As a psychological theorist Ebbinghaus was inclined toward nativism as against genetic and empiristic theories in the explanation of spatial and temporal perception and of discrimination. He nevertheless favored a genetic theory to account for tridimensional perception and a peripheral theory of tone analysis as against Stumpf's view of central fusion.

S., in *Journal of Philosophy, Psychology and Scientific Methods*, vol. vi (1909) 253-56, containing bibliography.

EBERT, FRIEDRICH (1870-1925), German statesman, first president of the German Republic. Ebert was the son of a tailor in Heidelberg and became a journeyman saddler. Early a member of the German Social Democratic party, he filled many party and communal offices and in 1905 became a member of the central committee of the party. In 1912 he was elected to the Reichstag and in 1913 succeeded Bebel as party leader. Ebert's importance outside his own party began during the World War. The policy which he represented both as party leader and as chairman of the budget committee of the Reichstag may be summed up in two phrases: national defense and peace by mutual agreement. In furtherance of the latter he took part in the socialist peace conference in Stockholm in 1917. This double policy aroused the antagonism both of the advocates of peace by annexation and of those within Ebert's own party who opposed the voting of war loans and who finally withdrew to form the Independent Social Democratic party. In internal politics throughout the war period Ebert advocated change from autocratic to popular government. When in October, 1918, the empire made a belated attempt to save itself

by turning to parliamentarism, Ebert induced his party to cooperate with and accept responsibility in the newly established government. He took over the chancellorship from the last imperial chancellor, Prince Max, on November 9, 1918, and thereafter brought the revolutionary movement under the moderating control of his own party. As a member of the provisional government he opposed the demands for a dictatorship of the proletariat, aided in the suppression of violent insurrections of radical parties and urged the earliest possible return to law and order through the calling of a national assembly. He was elected president in 1919; democracy and national unity continued to be the leading motifs of his policy in that office. The danger of national destruction was the deciding factor in his advocacy of acceptance of the Treaty of Versailles; defense of democracy motivated his suppression of the Kapp Putsch reactionaries in 1920.

As president, Ebert accomplished two great tasks: the strengthening of the republic and the reconstruction of the nation. His domestic policy was directed toward overcoming his own party's unwillingness to work with capitalistic factions, creating coalitions of parties loyal to the republic and keeping reactionary groups from active participation in the government as long as possible. His foreign policy laid the foundation for that program of loyal fulfilment of the terms of the peace treaty which Wirth and Stresemann later pursued in the conviction that only thus could they hope to demonstrate the limits of possible fulfilment. Ebert took an active although not always apparent part in every important political decision reached during his administration and thus made the office of president, invested by the constitution with limited powers, one of political as well as of representative importance. With Ebert's death in 1925 the voices of insult and slander which had accompanied him throughout his term of office were silenced, giving way to recognition of his great human qualities and political abilities. Prime Minister MacDonald of England aptly called him "Europe's wise and patient servant."

GUSTAV RADBRUCH

Consult: Löbe, Paul, and others, *Friedrich Ebert und seine Zeit* (Charlottenburg 1928); *Baden, Max von, Erinnerungen und Dokumente* (Stuttgart 1927), tr. by W. M. Calder and C. W. H. Sutton as *The Memoirs*

of Prince Max of Baden (London 1928); Müller-Franken, Hermann, *Die Novemberrevolution* (Berlin 1928); Scheidemann, Philipp, *Memoiren eines Sozialdemokraten*, 2 vols. (Dresden 1928); *Der Prozess des Reichspräsidenten*, ed. by K. Brammer (Berlin 1925).

EBERT, MAX (1879-1929), German historian and archaeologist. Ebert was born at Stendal in Saxony and studied at Innsbruck, Heidelberg, Halle and Berlin. He was successively professor of prehistory at Königsberg and Riga and after 1927 at Berlin. Taking German antiquities and origins as his starting point he stressed the need of calling in the aid of the allied sciences of anthropology, ethnology, folklore and philology to the elucidation of his theme, and he further emphasized the view that no knowledge of a single European region can be adequate without embracing the perspective of primitive and archaic culture as a whole both in Europe and in western Asia. His writings include books and articles dealing with the antiquities of southern Russia and with primitive eschatology, but his chief contribution to the social sciences is the monumental *Reallexikon der Vorgeschichte* (14 vols., Berlin 1924-29), to the editing of which with the collaboration of various specialists he devoted the last eight years of his life. The illumination of the material findings of archaeological exploration by an extended use of the comparative method was the guiding principle which inspired Ebert's treatment of the history of culture.

ECCLESIASTICAL COURTS. Although in its broadest sense the term ecclesiastical courts embraces perhaps the tribunals of all religious organizations, it will be used here in a narrower sense as meaning the courts of the Christian church, particularly those of the Roman Catholic church and the Protestant churches which have developed alongside it since the Reformation. To understand their development it is important to recognize that, while the creeds and sacraments of Christianity and the principles of the canon law were partly derived in varying degrees from Judaic and Graeco-Roman elements, the constitutional framework of the church incorporated in an ever increasing degree the main hierarchical and political features of

the imperial Roman organization. The Roman Catholic church far more than the Holy Roman Empire was the true successor in the West of the ancient Roman Empire.

The mediaeval constitution of the church, the main features of which have endured to the present day, is predicated upon the idea that the Catholic church is the community or society of all those who under the leadership of the pope, as Christ's visible representative, and of the bishops are bound together by the Catholic faith and the sacraments, and that only this Catholic church is general, apostolic and infallible. For the realization of its objects the church has received from its Founder three powers: the *potestas ordinis*, for the dispensation of divine grace and the sacraments; the *potestas magisterii*, for the declaration and spread of true doctrine; and, finally, the *potestas jurisdictionis*, for the leadership and governance of the ecclesiastical body—powers belonging, however, not to the church as a whole, composed as it is of both clergy and laity, but possessed only by the clergy, a special rank or order in ecclesiastical membership acquired only by *ordinatio*. From the point of view of government, or *jurisdictio*, the chief officers of the church, in the ascending scale of the hierarchy, are the bishops, the archbishops and the pope.

In the law of the church, in sharp contrast with the conception of jurisdiction in secular laws, *jurisdictio ordinaria* is extremely broad: it embraces both legislation and administration. While these are sharply distinguished, it is to be observed that administration (*administratio*), which embraces all the powers of government that are not legislative in character, includes not only governmental administration in general but also the judicial administration of the law. The term *judex ordinarius* is moreover applicable to *jurisdictio ordinaria* in all its implications: the *judex*, in the exercise of *jurisdictio*, is legislator, administrator and judge. Thus, in contrast with modern conceptions of secular constitutionalists, in the canon law the notions of *jurisdictio* and *judex* are both wide and elastic; nevertheless, only those functions of the *judex* which have to do with the administration of justice will be noted here.

The persons who exercise the powers of *jurisdictio ordinaria*, known as *judices ordinarii*, derive their authority either from *jus divinum*, as the pope and the bishops, or from *jus humanum*, as the archbishops and the archdeacons; and each one of the *judices ordinarii* has his own

well defined share in the exercise of the legislative and administrative powers embraced in *jurisdictio ordinaria*. In the canonical conception of the Middle Ages, which is, however, post-Gratian, the pope, as distinct from all other *judices*, is the *judex ordinarius singulorum*; for not only is he the ultimate source of justice on appeal from the decisions of the lower *judices* but, as in the case of the emperor, all legal causes may be brought directly to him for judgment. The totality of the pope's rights of leadership in the church is known as his *primatus jurisdictionis* in contrast with his *primatus honoris*. In his supreme government of the church the pope is assisted by the Curia Romana.

While *jurisdictio ordinaria* is the original and basic form of *jurisdictio*, the growth of the church amid the complexities of mediaeval life, coincident with the rise of papal power, led to the development of *jurisdictio quasi ordinaria*, *delegata*, *mandata* and *vicaria*. The growth of these several forms of *jurisdictio*, which had its beginnings in the first half of the twelfth century, rested at first on practise; but the forms soon became the subject matter of doctrine and were finally incorporated, together with the fine distinctions of the canonists, in the *jus canonicum*. The influence of these newer forms of *jurisdictio* on the system of ecclesiastical courts will be seen to have been especially marked upon the system of appeals.

Only the *judices ordinarii* can delegate *jurisdictio*; and the scope of the *jurisdictio delegata* is determined by the *commissorium*, which, on pain of nullity attaching to the acts of the *judex* proceeding under a delegation, cannot be exceeded. In general a *judex ordinarius* can delegate powers to another person either for a single matter or for a category of matters; and normally the delegate is empowered to do everything necessary for the performance of the *commissorium*. In contrast with the delegates of bishops the papal delegates are empowered to subdelegate; and in respect of this power the *delegatus a summo pontifice* appears to be placed on an equality with the person who receives delegated power *ab imperatore*. On general principles of the canon law only clerical persons can be made delegates to deal with spiritual matters but lay persons can be delegated in temporal causes.

The bishops' courts, as they came to be constituted at the height of the church's spiritual and temporal power, deserve special attention, since they were on the whole the tribunals of primary importance in the judicial system of the

church. In the Middle Ages the bishop, if at the same time he was a feudal lord, possessed a jurisdiction over his vassals that was exercised on his behalf by a *vice dominus* (*vidame*); but this jurisdiction, restricted to feudal and temporal matters, was entirely distinct from the jurisdiction which the bishop exercised, as a member of the ecclesiastical hierarchy, over the clergy and laity. In the earliest history of the church the bishops acted as arbitrators of disputes, and under Constantine their decisions were regarded as binding. Although in the West this episcopal authority in arbitration cases had fallen into disuse long before the time of Charlemagne, the imperial constitution of the post-Constantine epoch recognized nevertheless that in ecclesiastical matters the bishops possessed judicial power.

As *judex ordinarius* the bishop was invested with powers of *administratio*, which included, as has been seen, the administration of justice; but by the twelfth and thirteenth centuries this part of the bishop's *jurisdictio* came normally to be exercised on his behalf by an official (*officialis*) commissioned by the bishop. The word *officialis* had been used to designate the members of the *officium* of a Roman magistrate; but it now indicated an ordained clerk who although possessed of no jurisdiction of his own was charged, under a mandate issued by the bishop, with the exercise of his spiritual jurisdiction as bishop.

This important development of *jurisdictio mandata*, which reformed the episcopal court, was due to two historical causes; and it coincided with the revival and renaissance of the study of Roman law at Bologna and other universities in the twelfth and thirteenth centuries. Since the procedure of their courts had become more technical and complicated, the bishops, who were not necessarily lawyers, found themselves obliged to employ clerics versed in the Roman and canon law to exercise their judicial powers; these clerics were the officials. Another reason for their introduction was the rise of the archdeacons during the twelfth and thirteenth centuries to a position of independence as judges. Although by the *jus commune* the archdeacons were the bishops' assistants, by custom they acquired their own jurisdiction at the expense of episcopal jurisdiction; and the courts of the archdeacons became tribunals of first instance, from the decisions of which appeals could be carried to the courts of the bishops. This encroachment upon the bishop's original jurisdiction was not terminated until the later Middle

Ages, when the jurisdiction of the archdeacon as *judex ordinarius* was ended by the Tridentinum. Since his assistant had become his rival, the bishop was forced to struggle for his own jurisdiction; and he accomplished his purpose by appointing an official to exercise his jurisdiction who, having acquired all his powers from the bishop, was under the bishop's control as his *mandatarius*. Apart from these reasons for the introduction of the officials there was the rise of the church to the position of a world state with claims to temporal as well as spiritual authority, resulting in a vast increase in the duties of the bishop as the governor of his diocese and making it natural for him to seek relief by entrusting the judicial part of his *administratio* to a specialist.

Without attempting to examine comparatively the composition of the mediaeval episcopal courts in the several countries of the West, notice may be taken of the constitution of the bishops' courts in France during the period from about 1180 to about 1328. In the France of that time, as elsewhere in the West, a distinction was drawn not only between the principal official and the *vicarius generalis* but also between principal officials (*officiales*) and non-resident officials (*officiaux forains*). The bishop's principal official had his seat at the place where the bishop resided (in the case of the archbishop's principal official, where the archbishop resided) and his mandate extended to all matters (*universitas causarum*). He was not a delegated judge exercising *jurisdictio delegata* but a *judex ordinarius*. The court of the principal official was in fact the bishop's court itself, and hence no appeal lay from his decisions to the bishop. The non-resident official, on the other hand, had limited powers. Not only had he no competence with respect to certain important matters, as, for example, matrimonial causes, but he was also limited in respect of territory to a part of the diocese. He exercised, moreover, merely delegated jurisdiction (*jurisdictio delegata*), and accordingly an appeal lay from his decisions to the court of the bishop.

The bishop's court, normally held by the principal official in the exercise of *jurisdictio ordinaria*, included in its personnel several assistants, chief among whom were the *assessores*, the *sigillator*, the *receptor actorum*, the *registrator* and the *promotores*. Normally several assessors (*assessores*) who were not permanently attached to the court assisted the principal official by advising him during the hearing of a cause. They were lawyers, generally chosen from among the

advocates in the see; and although the official was not bound to follow their advice he always mentioned, when he gave judgment, that he had taken their counsel (*juris peritorum freti consilio*). Next to the principal official the *sigillator*, the sealer, was the most important and dignified personage of the court. He had the custody of the seal, by which he authenticated all the acts of the court; he was held to be learned in the law and the practise of the court; and it was he who warned the principal official and his notaries of any possible errors which they might commit. He also examined documents and in general supervised the notaries. The *receptor actorum* exercised his functions in the *camera episcopi* or *camera officialis*, and as one of his principal duties he received and had the custody of all documentary acts sent to the court. Among the duties of the *registrator* was the keeping of a register of the names of all persons who were censured, excommunicated or otherwise penalized under the sentence of the court. The promoters (*promotores*) represented the bishop, defending his interests and initiating in his name the repression of crimes and delicts; in general, they corresponded to the *gens du roi*, or king's officers, in French secular courts. In addition to all these personages there were the representatives of the parties: the barristers, or advocates (*advocati*), and the procurators (*procuratores*). The notaries (*notarii*) were charged with the preparation of all documentary acts involved in the conduct of a case, including those acts which were passed under the seal by the *sigillator*. Finally, there were the executors (*executores*, *missi*, *bedelli*, *apparitores*), empowered to summon persons, to deal with the contumacious, to insure the execution of judgments.

In the system of appeals a mediaeval development tended to a diminution of the bishops' and the archbishops' courts alike. The papal courts acquired a jurisdiction which was concurrent with that of the lower tribunals, with the result that many cases were taken directly to the pope for decision without being first heard by the lower courts. The reform councils of the fifteenth century sought to end or at least to limit and modify this practise, declaring that the normal appellate system should be maintained and that, moreover, appeals to the pope should not be heard at Rome but should be brought before local judges invested with *jurisdictio delegata* (so-called *judices in partibus*). The Council of Trent at last gave effect, although in modified form, to these proposals. There thus

grew up a system of local papal appeal courts, the so-called *judices synodales*, *judices prosynodales*. In more recent times this system has been extended, as in the German and Austrian dioceses of the Roman church; and where it prevails the pope delegates his appellate jurisdiction to bishops and archbishops, who in turn subdelegate it to their courts.

With respect to *jurisdictio delegata* the principle prevails that appeals from the decisions of a *judex* as delegate are heard by that *judex ordinarius* who has delegated the power. Where, however, a papal delegate has subdelegated, the appeal from a decision of the subdelegate is not heard, as a rule, by the delegate but is taken at once to the pope; but if the subdelegation concerns merely an interlocutory matter, the appeal from the subdelegate is heard by the delegate himself.

The papal courts that form part of the Curia Romana naturally play a prominent role in the system of appeals. The most important of these are the Sacra Romana Rota, the Camera Apostolica and the Court of Signatura Justitiae; the first is a most imposing court. In the Middle Ages the Sacra Romana Rota, which had developed out of the earlier papal system of *auditores*, became *totius christiani orbis supremum tribunale*. While the establishment by Sixtus v in 1588 of standing *congregationes*, some of which were given extensive judicial powers, caused the decline of the Rota, it has been revived, as a result of the reform of the Curia by Pius x in 1908, and is now a court of appeal in both civil and criminal causes. The judicial bodies of the Curia should be sharply distinguished from its other organs, such as those organs of grace known as the Signatura Gratiae and the Dataria Apostolica.

For although, as has been said, *administratio* embraces in its widest sense all the varied aspects of *jurisdictio* except legislation, the church in its courts achieved the gradual separation of judicial from general administrative functions. The process has been accompanied by the slow formation of that vast body of law enshrined in the *Corpus juris canonici*. Not only the scholarly study of the law by the canonists, many of whom were also legists, but in addition the introduction of members of the lawyer class into the ecclesiastical courts as officials, assessors, sealers and advocates tended to emphasize the part played by the law in church life and thus to give to the judicial function a purely legal as distinct from an administrative character. On the

civil side the ecclesiastical courts gave to the judicial system of western Europe the famous Romano-canonical procedure. On the criminal side, although the accusatory system prevailed in the ecclesiastical courts in the early Middle Ages, the church later developed an inquisitorial procedure which not only had far reaching influence upon the lay tribunals but also received a special and drastic application in the so-called Holy Inquisition (*see* CANON LAW).

The church courts were highly important instruments of ecclesiastical discipline. In its origins the criminal and disciplinary system of the church, as gradually authenticated by incorporation in the canon law, was based on Christian ideas of morality and sin; and although other elements, some of which were derived from Roman and Germanic conceptions and institutions, were also adopted, the system has always been dominated by its original Christian features. The wide scope of the jurisdiction of mediaeval ecclesiastical courts, a jurisdiction which not only embraced clergy and laity alike but extended itself far into the secular sphere of law, enabled the courts by the application of the criminal and disciplinary system which they administered to act as a vast machinery for the establishment and maintenance of high moral standards in the social life of western communities. Religious and moral ideas also dominated in large measure that part of the canon law which was concerned with the civil as distinct from the criminal and disciplinary aspects of the legal life of the whole ecclesiastical body.

After the Reformation the authority of the Catholic hierarchy was gradually curtailed, and the originally wide jurisdiction of the ecclesiastical courts was ultimately restricted in practice as in principle to the matters that were purely spiritual as distinct from matters of a purely temporal character. Some of the earliest historical roots of the modern relations of the churches *inter se* and also of the relations of the states to the churches may perhaps be found in the conditions of the Frankish era. In the Frankish empire the ecclesiastical courts had had complete freedom to decide cases in accordance with canonical law, but at the same time the jurisdiction of the lay tribunals was not excluded where an ecclesiastical case could be properly regarded as falling within the province of secular law; thus, although marriage was a sacrament, the ecclesiastical courts did not possess, in accordance with Frankish law, an exclusive jurisdiction. As a reaction against Frankish condi-

tions the church had sought not only to acquire an exclusive jurisdiction for its own tribunals in all spiritual matters but also to extend the jurisdiction of the ecclesiastical courts in purely civil and criminal cases and in this way to enter the realm of secular law. Thus there began that momentous struggle for jurisdiction between the ecclesiastical and lay courts which gave color to so large a part of the legal history of Europe in the later Middle Ages and which was not ended until the rise of territorial states.

In the period which immediately followed the Reformation the scope of the jurisdiction of ecclesiastical courts in Protestant countries with established state religions was very wide, reflecting the influence of the extensive jurisdiction of Roman Catholic ecclesiastical tribunals in the later Middle Ages; but the marked general tendency in modern times has been to curtail ecclesiastical jurisdiction and to restrict it to the sphere of church discipline and other purely ecclesiastical matters. Thus in England, which may be taken as a typical example, the jurisdiction of the ecclesiastical courts has been gradually reduced by the transfer of matters to the competence of the state courts.

Although in 1676 "all punishment by death in pursuance of any ecclesiastical censures" was abolished by statute (29 Chas. II, c. 9), the act contained a proviso which left intact the jurisdiction of the ecclesiastical courts in cases of atheism, blasphemy, heresy, schism or "other damnable doctrines and opinions," allowing these offenses to be punished by excommunication, deprivation, degradation and "other ecclesiastical censures not extending to death." Although this jurisdiction still theoretically remains it has fallen into disuse. Again, the ecclesiastical courts in mediaeval England exercised a very wide disciplinary control over the morals of all the members of the church; and, proceeding in general by inquisition or denunciation, they punished a varied and numerous class of offenses which included adultery, procuration, incontinency, incest, defamation, sorcery, witchcraft, swearing, drunkenness, profaning the Sabbath and haunting taverns. This system of ecclesiastical criminal jurisdiction, in full vigor up to 1640, was abolished by Parliament in 1641 but was restored in 1661. Although the ecclesiastical courts still have jurisdiction to try cases of adultery and fornication, in general their jurisdiction over moral offenses has been greatly curtailed because of the jurisdiction of the temporal courts. Thus unnatural offenses,

witchcraft and bigamy were made felonies in 1533, 1541 and 1603 respectively; while certain forms of incest were made misdemeanors in 1908. In 1823 jurisdiction in cases of perjury, in 1855 defamation and in 1860 brawling by laymen in church were removed from the ecclesiastical courts. In theory the jurisdiction of the English ecclesiastical courts with respect to certain kinds of immorality still remains, but in practise these courts act only in the case of the clergy.

Turning to the civil side of the jurisdiction of the English ecclesiastical courts, it is to be noticed that their claim to hear cases of breach of faith (*fidei laesio*) and hence to exercise jurisdiction in contract did not ultimately prevail because of the issue of writs of prohibition by the common law courts. On the other hand, they had undisputed jurisdiction, certainly from the twelfth century onward, in matrimonial and divorce causes, and, similarly, they early acquired an extensive jurisdiction in testamentary causes; but in 1857 this jurisdiction both in matters testamentary and in divorce was taken from them and vested in the temporal courts. While the common law courts have always firmly maintained an exclusive jurisdiction over one kind of ecclesiastical property, the advowson, the ecclesiastical tribunals formerly exercised jurisdiction in many questions concerning tithes, church dues and dilapidations; but this aspect of their jurisdiction was greatly curtailed by nineteenth century legislation. In many matters that are purely ecclesiastical, such as ordination, discipline of clergy, doctrine and ritual, consecration, celebration of divine service and disputed applications for faculties, the English ecclesiastical courts of the present day appear to have an exclusive jurisdiction.

At the present day, even in countries where the Roman Catholic church is established, the state law of crimes and punishments prevails in general in respect of both clergy and laity; and in general the ecclesiastical courts have no civil jurisdiction, since cases respecting civil matters, such as contract, now fall within the domain of temporal law. Nevertheless, through consent and submission of its members the Roman Catholic church in all countries decides *in foro conscientiae* questions of betrothal, marriage and legitimacy; but except in Spain, Portugal and Peru, where the courts of the Roman Catholic church still have competence within certain limits in matrimonial causes, including divorce, no temporal consequences follow from such de-

cisions. As a matter of principle in all states, even in states where the Roman Catholic church is established, the only discipline exercised over the laity by ecclesiastical courts is penitential; and although in most countries, even in countries with established Protestant churches, such as England, discipline of the clergy, including ecclesiastical penalties, falls within the competence of the ecclesiastical courts, questions as to discipline are sometimes raised in the temporal courts. In non-episcopal religious communities, such as those established during the Reformation period in Holland and in the Protestant states of Germany and Switzerland, church courts in any true sense disappeared. Over ministers and other holders of office discipline was exercised by administrative methods, which took the form of trials before consistories or synods, and to this extent ecclesiastical jurisdiction is still in force in these countries. Penitential discipline over the laity has also been exercised in these countries by consistories and synods. but in more recent times censures of this kind have ceased in general to have any temporal consequences. Speaking in the most general terms it may be said that since the Reformation the discipline of members of churches has been the concern of both church and state. Ecclesiastical discipline has been and still is exercised in many countries over both clergy and laity; but discipline of the clergy has held and still holds a greater prominence than discipline over the lay members of churches.

While the Roman Catholic church has steadily adhered to the principle that only the ordained clergy are entitled to govern the church as legislators, administrators or judges, the Protestant churches have admitted laymen to a large share in ecclesiastical governance. Striking illustrations of this post-Reformation tendency may be observed also in the Church of England; notably the position of parochial lay officers such as church wardens, the existence of the House of Laity in addition to the House of Bishops and the House of Clergy in the National Assembly and the introduction of lay judges in the ecclesiastical courts. The practise of appointing lay judges rests historically on the mediaeval system of officials in the courts of the Roman Catholic church. While the history of officials in the several ecclesiastical courts of England is a matter of much interest, it must suffice to remark that for a long time the office of official principal of the archbishop of Canterbury has been united with that of dean of the Arches; and

that, moreover, the considerable jurisdiction now exercised in ecclesiastical matters by the dean of the Arches is exercised by him as official principal, since his jurisdiction is restricted to the peculiars of the archbishop. For a long time this combined office has been held by a lay member of the Church of England who is a barrister of ten years' standing or a person who had been a judge of one of the superior temporal courts. The older ecclesiastical tribunals such as the archidiaconal, episcopal and archi-episcopal courts still preserve many of their pre-Reformation characteristics. The highest ecclesiastical court of appeal is the Judicial Committee of the Privy Council, a tribunal which is composed of laymen but is assisted by assessors belonging to the clergy.

It is worthy of special notice that disestablished or unestablished churches are comparatively modern. The basic legal principle applied to these churches is that the relations of their bishops, priests or other ministers and the lay officeholders one to another are regulated by contract, as are the relations of the governing persons or bodies to the laity in general; and hence a consensual jurisdiction, which to this extent possesses temporal sanction, has been created. Thus in the United States at the present time churches have no position recognized by the state; they are bodies of believers whose constitutional and legal relations are governed by contract and whose ecclesiastical jurisdiction also rests on a consensual basis. If it becomes necessary for a temporal court to pass on a question of theology, it is treated purely as a question of legal interpretation.

In Germany the Reformation produced a *Staatskirchenrecht*, an ecclesiastical law of the state, with the result that churches have been regarded quite differently. They hold a special place in public law as distinct from private law as privileged corporations (*öffentlich-rechtliche privilegierte Korporationen*). In the evangelical system of ecclesiastical law in pre-war Germany administration of the discipline of the members of the church (*Kirchenzucht*) belonged to the congregations (*Gemeinden*) and their councils (*Gemeindekirchenräte*), while from their decisions an appeal lay to the *Kreissynodalvorstand*. For wrongs committed in the conduct of their office the clergy were subject to the disciplinary law of wrongs (*Disziplinarstrafrecht*); and while in general punishment was in the hands of the ordinary ecclesiastical authorities (in Prussia the *Konsistorien*, with appeal to the *Oberkirchenrat*

or the *Kulturminister*), in cases of deviation from doctrine the *Konsistorien* in Prussia were assisted by the *Provinzialausschuss* and the appeal judges by the *Generalsynodalvorstand*. In some of the other states of Germany there prevailed a somewhat different system of courts for the administration of *Disziplinarstrafrecht*. Since the constitution of 1919 ecclesiastical organization in the German states has undergone many changes in the direction of democratization.

Indeed, it is interesting to observe that the political constitutions of the states are reflected to a certain extent in contemporary religious disciplinary institutions within their territories. Thus in monarchical and autocratic states the religious disciplinary institutions have tended to display like characteristics; in states with marked democratic political tendencies the disciplinary religious institutions are generally based, in part at least, on democratic lines. Naturally the Roman Catholic church, jealously maintaining its mediaeval monarchical hierarchy, has not been subject in this respect to democratic influences although it has yielded somewhat within the sphere of social activities. Not only in states with an autocratic tradition but also in democratic communities, as, for example, Quebec, the Roman Catholic church has administered, within the limits fixed by the temporal power, its traditional system of discipline. Protestant churches, on the other hand, have shown a marked tendency even in monarchical states to adapt their constitutions, including their disciplinary systems, to the ideas of democracy; but naturally the degree of democratization achieved has not everywhere been the same.

ECHEVERRIA, JOSÉ ESTEBAN ANTONIO (1805-51), Argentine sociologist and revolutionist. Echeverría attended the Colegio de Ciencias Morales of Buenos Aires and from 1825 to 1830 studied in Paris, where he became interested in the social philosophies of Montesquieu, Sismondi, Lermínier and others. After his return to Argentina he came under the influence of the theories of Saint-Simon as propagated by Leroux and in 1837 became president of the Asociación de Mayo, a secret patriotic organization of young literary men formed for the discussion of national and philosophic questions and opposed to the tyrannical rule of Rosas. Echeverría drew up the credo of the society, which was based almost entirely upon Saint-Simonian doctrine. Exiled by Rosas, Echeverría took refuge in Montevideo, where he remained from 1840 until his death. There he published *Dogma socialista* (Montevideo 1846; republished, La Cultura Argentina edition, Buenos Aires 1915), his chief theoretical work, which was an amplification of the social theories of the Asociación de Mayo.

Echeverría is recognized as the forerunner of the social science movement in Argentina. He formulated the first economic interpretation of Argentine history, an interpretation which has dominated sociological thought in Argentina until very recent times. He argued, together with Alberdi, that courses in social philosophy should be introduced into the university curricula. Among Echeverría's important works are *Ojeada retrospectiva* (Montevideo 1846), a review of the political and social history of Argentina from 1837; *Filosofía social*, a discussion of the philosophic movement which preceded the French revolution of 1848, and *Plan económico* (both of which are included in La Cultura Argentina edition of *Dogma socialista*).

ECOLOGY, HUMAN. Human ecology deals with the spatial aspects of the symbiotic relations of human beings and human institutions. It aims to discover the principles and factors involved in the changing patterns of spatial arrangement of population and institutions resulting from the interplay of living beings in a continuously changing culture. It has but little in common with plant and animal ecology, for while the symbiotic processes are essentially alike for all organisms, their mode of operation in the human community is hardly comparable with the food chains and environmental controls existing in plant and lower animal communities. Man is a cultural animal and is able therefore to modify his natural environment and to create within limitations his own habitat. The division of labor that he effects with members of his own species determines the basic elements of his communal mode of living, and since this is fundamentally a cultural rather than a biological phenomenon it is subject to continuous change in form. Hence the sequences in the human community are not comparable with those in the plant or animal community.

The subject matter of human ecology can be classified under three general categories: ecological organization, which represents the spatial arrangements of population and institutions at any given time either within a local community or within a larger constellation of communities; ecological dominance, which represents the dynamic or functional aspects of spatial relationship; and ecological succession, which describes temporal changes in the human community.

The research in the field of human ecology has been done largely by geographers, students of population and economic historians. The geographers have focused their attention for the most part on the environmental factors determining the location, size and general contour of the community without giving much consideration to the spatial aspects of division of labor resulting from cultural change. Students of population have contributed data on distribution, migration and density. The chief limitation of their research from an ecological standpoint lies in the fact that they tend to regard the political area, usually the state, as the territorial unit of aggregation rather than the area which arises out of conditions of competitive cooperation. They also tend to consider equilibrium as fundamentally a relation between gross numbers and natural resources rather than as a phenomenon of a hierarchical structure of division of

labor; hence their emphasis on mass migration rather than on individual mobility. Economic historians have contributed to human ecology by tracing the growth of economic institutions from a spatial as well as a temporal standpoint.

Human ecology offers many important problems for research, such as the distribution and composition of populations; the delimitation of natural territorial groupings and zones of communal influence; the spatial arrangement of institutions and services under different conditions of density and mobility; and the nature of the interdependence of centers both within the local area and within the larger constellation.

Knowledge of ecological processes is basic to all social sciences, as social and political institutions have a spatial base and arise and function in response to changing conditions of movement and competition. Institutional stability is largely dependent upon stability of space relations. The constantly changing patterns of division of labor and of population distribution necessitate a

continuous process of institutional adjustment.

ECONOMIC HISTORY IN THE UNITED STATES N. S. B. GRAS

ECONOMIC HISTORY AS A DISCIPLINE J. H. CLAPHAM

SURVEY OF DEVELOPMENT TO THE TWENTIETH CENTURY. Historians have never ignored economic considerations, but early in modern times many of them acted as though the economic field were not worthy of their attention. Fleetwood, the first exact student of price history, thought that most people would despise "the Pains that are taken in making Collection of so mean things as the Price of Wheat and Oats" (*Chronicon preciosum*, 1707). "Mean things," however, had assumed dignity as they increasingly contributed to the power of the state. The best minds of the seventeenth century had been almost all worshipers of Leviathan and were universally curious, so they valued all facts bearing on the state's power and wealth. Descriptions of national resources and organization were not a new thing; but in Germany Hermann Conring made a university discipline of them ("university statistics"), while in England William Petty gave such studies a fresh turn with his conception of political arithmetic, defined by Davenant as "the art of reasoning by figures upon things pertain-

ing to government." Carried on for a generation or two such "reasoning" might have produced a quantitative economic history. But conditions were not favorable. Until late in the eighteenth century few statistics were collected in Europe, and still fewer were made available.

The current fashion of comparing national resources and a mercantilist interest in commerce and its relation to national power had produced such a book as William Temple's *Observations upon the United Provinces* (1672), but this and others of its kind were hardly economic history as now understood, although they paved the way for it. Nor were the *History and Antiquities of the Exchequer* (1711) and the *Firmaburgi* (1726) of Thomas Madox, although they too paved the way. Their point of view is legal and institutional, but their concern is primarily with fiscal institutions. They initiated an alliance between economic and institutional studies which was to prove fruitful.

Eighteenth century statistics in Germany gave no help to the growth of a quantitative economic

history. Its leading representatives, Achenwall and Schlözer, made little or no use of even the few figures that existed. Their statistics was a kind of historical and descriptive politics. As figures became more numerous and accessible toward the end of the century, members of this school spoke with some contempt of the "common" arithmetical statisticians, whom they affected to treat as uninspired computers. But one of these "slaves of tables," Pastor Süssmilch, had carried forward with success the demographic studies initiated by Graunt and Petty, part of the raw material for exact social and economic history.

Meanwhile interest in special aspects of economic history and affairs had produced commercial histories, studies of taxation and currency, and commercial dictionaries and annals. Such were John Smith's *Chronicon rusticum-commerciale; or Memoirs of Wool* (1747), an exhaustive chronologically arranged compilation of printed matter bearing on wool and the woolen industry; James Postlethwayt's *History of the Public Revenue from 1688 to 1758* (1759); Adam Anderson's comprehensive *Historical and Chronological Deduction of the Origins of Commerce* (2 vols., 1764), a chronological account of commerce from creation to the end of the Seven Years' War; Dupré de Saint-Maur's *Essai sur les monnoies* (1746); Raynal's *Histoire . . . des établissements et du commerce des européens dans les deux Indes* (1770); the early histories of the American colonies; the various editions of the Savary des Bruslons' *Dictionnaire universel de commerce . . . et des arts et métiers* (1st ed. 1723), on which was based Malachy Postlethwayt's *Universal Dictionary of Trade and Commerce* (2 vols., 1751-55).

Some of these studies supplied material for the historical sections of Adam Smith's *Wealth of Nations* (1776). It was only in his avowed digressions and particularly in the great digression in which he used and improved on Fleetwood's account of the changes in the purchasing power of the precious metals that Adam Smith wrote pure economic history, although there is much of it in the chapters on colonies and the growth of towns; but his writing is informed throughout with the historical knowledge of his day and he always considers economic affairs as in a state of growth and motion.

Within a few years of Smith's death there appeared Sir Frederick Eden's *State of the Poor: or an History of the Labouring Classes in England from the Conquest to the Present Period* (1797); although not very satisfactory as social history,

resembling too much Burn's *History of the Poor Laws* (1764), this work is the earliest avowed chronicle of the laboring classes in any language. Malthus' *Essay on Population* (1798), which appeared in the following year, was as first printed more dogmatic than historical; but in five succeeding editions he heaped historical and statistical material about the argument which dominated the thought of English economists for half a century. It was not until some time after Darwin had drawn inspiration from it that its relevance to social and economic history was fully appreciated.

In this period German historical writing was inspired by an attachment to local culture and an interest in tracing indigenous cultural elements back to the early Middle Ages. Möser's *Osnabrückische Geschichte* (2 vols., 1768), an outstanding example of German local history, stressed early agrarian conditions as a key to historical understanding, and Anton's *Geschichte der teutschen Landwirtschaft* (3 vols., 1799-1802), the first agricultural history, explained many peculiarities of later agrarian organization as survivals of an early state of freedom and communal land ownership. Preoccupation with classical antiquity inherited from the eighteenth century is reflected in Heeren's *Ideen über die Politik, den Verkehr und den Handel der vornehmsten Völker der alten Welt* (3 vols., 1793-1812), which marks an epoch in the writing of commercial history, and in the far more scholarly and critical *Die Staatshaushaltung der Athener* (2 vols., 1817) by August Böckh, who laid the foundation for an economic and social history of Athens.

The political, legal and economic revolutions of the period from 1789 to 1848 raised historical problems and stirred historical imagination. There were revolutionary agrarian changes all over western Europe which aroused curiosity about agrarian history. Machine industry was spreading from England to the continent and developing on its own lines in America. The German national revival and reaction from the unhistorical attitude of eighteenth century philosophy inspired the legal and institutional history of Eichhorn and Savigny, which in its turn inspired the historical economics of Roscher, whose *Staatswirtschaft nach geschichtlicher Methode* (1843) is not a great book but which combined with his later writings had great influence. Through the historical school in economics and through encouraging research into the legal history of institutions, many of which had impor-

tant economic bearings, the historical school in jurisprudence has been responsible for a very large amount of work on economic history in Germany and for its emphasis on origins and structure rather than on function. German nationalism and the knowledge of American protectionist thought inspired *Das nationale System der politischen Ökonomie* (1841) by Friedrich List. Although List was an anti-free-trade propagandist and a political genius rather than a professed historian, his contentions led the economist straight into history; for they asked him to study problems of wealth not at a point in time and all on one plane but to think of live changing nations on different and shifting planes and of the growth of their productive powers.

In France Saint-Simon, who like List was no historian and knew something of America, had taught to a group of able and influential disciples the absolute primacy of industry, i.e. economic activity, in human affairs. He was mainly interested in the future but his influence, direct or indirect, tended to make economic historians out of those interested in the past.

In England practical men early wrote of the new industries which they understood. There was a considerable historical literature about cotton before the appearance of Baines' standard *History of the Cotton Manufacture* (1835). Scrivenor's *Comprehensive History of the Iron Trade* appeared in 1841. The history of wool was carried forward by Bischoff of Leeds in his *Comprehensive History of the Woollen and Worsted Manufactures* (1842). More important for the future of economic history was the natural pre-occupation of men of affairs with the war and post-war price vicissitudes of the period and with the policy of governments toward them. The monument of this is Tooke's *History of Prices . . . from 1793 to 1837: Preceded by a Brief Sketch of the State of the Corn Trade in the Last Two Centuries* (2 vols., 1838), which has a free trade orientation. It was carried forward in successive volumes by Tooke (4 additional vols., 1840-57), on the last two of which he was assisted by Newmarch.

During the nineteenth century all civilized nations adopted regular censuses. The need for statistics of every kind was urged by reforming philosophers (in England, especially by Jeremy Bentham), by government officials, who needed exact materials, and by men of affairs, who wished to gauge national economic policy and progress. The result was a steady increase of statistical material, but until 1850 and in some

fields until much later the gaps were immense. Results of this first spell of statistical activity were put together for the United Kingdom by G. R. Porter in his *Progress of the Nation . . . from the Beginning of the Nineteenth Century . . .* (3 vols., 1836-43) and for Prussia by Dieterici, *Der Volkswohlstand im preussischen Staate* (1846). Although most writers of this class lacked wide vision they carried out work of which Petty had dreamed, and prepared for the quantitative treatment of modern economic history.

The transformation of agrarian conditions connected with the emancipation of the peasantry in many parts of Europe produced much descriptive literature, especially in German, and some work on agrarian history of outstanding historical value. The greatest name is that of Hanssen, whose writings on north German agrarian conditions and history began to appear in 1832. His study of peasant emancipation in Schleswig-Holstein was crowned by the St. Petersburg Academy of Sciences in 1860 just before emancipation was decreed in Russia. Hanssen began the investigation of early forms of agricultural settlement and distribution of landholdings which half a century later led Meitzen to publish the monumental *Siedelung und Agrarwesen der Westgermanen, Ostgermanen, der Kelten, Römer, Finnen und Slawen* (3 vols., 1896); it attempts to establish racial types of village formation and makes extensive use of village maps and field plans. Equally important was a parallel line of inquiry regarding the early mark and its connection with the two forms of manorial organization in Germany, the *Grundherrschaft* and the *Gutsherrschaft*. In this field the most influential and scholarly book was Maurer's *Geschichte der Markenverfassung in Deutschland* (1856), which together with his later book, *Geschichte der Dorfverfassung in Deutschland* (2 vols., 1865-66), profoundly influenced the writing of English constitutional history. In addition, many semilearned histories of commerce appeared in German in this period, but most of this work was of second rate quality.

In France the outstanding contribution to economic history produced in this period was Levasseur's *Histoire des classes ouvrières . . . jusqu'à la Révolution* (1859); it did for France with far more learning what Eden had attempted sixty years earlier for England. At the same time critical and editorial work of original authorities was being done by scholars not always primarily interested in economics. Guérard edited chartularies of the great abbeys, while his pupil Delisle,

perhaps the greatest archivist of the century, published in 1851 his *Études sur la . . . classe agricole et . . . l'agriculture en Normandie au moyen âge*, an early classic of exact documentary research.

Guérard, in the language of later controversy, was a Romanist, one who stressed the Roman and minimized the Teutonic elements in the legal, institutional and economic life of the Middle Ages. This controversy, which went on through the greater part of the nineteenth century, exacerbated by Franco-German political tension and conflict, was really more concerned with legal and institutional than with strictly economic issues: with town, guild and manor origins and history of agrarian tenures rather than with guild function, urban economic policy, agricultural output or prices. Its importance in the development of economic history lies partly in the immense stimulus which it gave to research and partly in the way in which it sometimes not only diverted those who might have been economic historians to institutional tracks but also led them to pay more attention to the uncertainties of origins than to the ascertainable facts of function.

In England also an undue prominence was given to institutional aspects of economic history, in part because of the success and high ability with which institutional and more particularly constitutional history was studied after 1870, the date of the first appearance of Stubbs' *Select Charters of Constitutional History*. This does not apply to Stubbs' Oxford contemporary, Thorold Rogers, who had begun in 1866 to issue his *History of Agriculture and Prices* (6 vols., 1866–87). As a history of agriculture it was very deficient, and as a history of prices not perfect. Rogers was an active politician and a historian with marked bias. But the prices, nearly all taken from manuscript sources, showed how mediaeval economic history might be studied quantitatively; and the results, although they now require revision, have served ever since as a basis for price history in England and as a stimulus to its production in other countries.

Stubbs' "Germanist" reading of Anglo-Saxon history, based on Maurer, led him to overrate the free Teutonic element in early English society. His conclusions, shared by all the leading English historians of the time, were challenged, with an abundant agrarian knowledge which Stubbs did not possess, in Seeböhm's *English Village Community* (1883). This book first made the mediaeval village live for English speaking

students, but it has long been recognized that it overemphasized the servile element in early society.

By this time even in England economic history had ceased to be an adjunct to economics or a battlefield for fiscal policies. Levi's meritorious work of 1872, the first general survey of the period since 1760, had been called in the old style *A History of British Commerce*, and Cunningham's wider enterprise of 1882, *The Growth of English Industry and Commerce*. Seeböhm's was the first important English book the title page of which carried the cognomen "An Essay in Economic History." Yet economic history in its comprehensive and independent modern form and with its modern title had first grown in the German speaking countries, where modern synthesis began in 1879 with Inama-Sternegg's *Deutsche Wirtschaftsgeschichte* (3 vols., 1879–99), which was limited, however, to the Middle Ages. It was at this time also that Schmoller's influence began to be felt in Germany. His collection of essays *Zur Geschichte der deutschen Kleinindustrie im 19. Jahrhundert* (1870) impressed alike German and foreign students of economic history, and *Die Strassburger Tucher- und Weberzunft* (1879), based in part on Stieda's researches, served as a model for a host of monographs on guilds in other German cities. In his "Studien über die wirtschaftliche Politik Friedrich des Grossen . . ." (in *Schmollers Jahrbuch*, vol. viii, 1884, p. 1–61, 345–421, 999–1091), the first part of which was translated by Ashley as *The Mercantile System* (1896), Schmoller succeeded virtually for the first time in placing the mercantilist policies of the seventeenth and eighteenth centuries in a historical setting; in this work he developed also his conception of the evolutionary growth of economic society, but in this stage scheme his chief concern was with the transition from the Middle Ages to modern times. At the same time Karl Bücher published *Die Bevölkerung von Frankfurt am Main im XIV. und XV. Jahrhundert* (1886), a work which constitutes an important contribution to the social statistics of mediaeval cities and which has provided the occasion for a considerable literature of criticism and comment. Another important influence was that of G. F. Knapp. The studies of his seminar at Strasbourg of the agrarian history of various German territories were intended to throw light on conditions immediately preceding the emancipation of the peasants, but they helped also to clarify the problem of manorial origins. In France attention

in this period was focused on Fustel de Coulanges, who led the Romanist attack on Maurer's theory of manorial origins and whose *La cité antique* (1864) is a valuable if oversimplified interpretation of the institutional history of Roman antiquity. Cunningham, whose magnum opus has even in its revised form too prominent a political framework, Schmoller and Knapp in Germany and Fustel de Coulanges in France illustrate the varying but in all cases rather close alliance of economic history with institutional and political history. Another interesting feature of this period is that most of the best work in all countries was done on classical, mediaeval or very early modern times, because the best preparatory work by general historians on sources and method had been in these periods.

Meanwhile in the first two editions of the first volume of *Das Kapital* (1867 and 1873) Karl Marx had thrown down his challenge to economists and historians, calling them into the modern world but at the same time making suggestions about the course of economic evolution in earlier ages—and indeed about the whole nature of history and the place of economics in human affairs—which must be either accepted or disproved. Even before that there had from time to time been a good deal of writing in general terms about stages in economic evolution. The revived interest in primitive societies and the rise of prehistoric studies had also stimulated speculation. Curiosity about the growth of large scale industry and machine industry had not slackened since the early years of the century. But beginning with the seventies the Marxian conception of capitalism slowly acquired a prominent place in historical thought. Historians and economists became increasingly concerned with such questions as the origins of capitalism, its forms and relations to other types of economic organization, its spread and influence in various societies and at various dates, its relations with the problems of money and the vicissitudes of prices, its connections with the early and later history of the New World.

Such discussions, however, entered their contemporary phase only with the appearance in 1902 of the first two volumes of Sombart's *Der moderne Kapitalismus*, a more frankly historical and academic, less partisan but not less challenging, work than *Das Kapital*. Its conclusions have been disputed by specialists at almost every point and modified by its author at several; but it furnished and in its revised form (3 vols., 1927) still furnishes a perpetual stimulus to in-

quiry. Sombart's distinction, based on Marx, between early and "high" capitalism, with a dividing line at the great mechanical inventions, has been fruitful and so have his suggestive if incomplete and overemphasized accounts of the part played by war and luxury in promoting large scale industry and standardization of output.

Marx went to history to prove a thesis and find material for a forecast. Others equally interested in the social problems of their day went to it for guidance in social reform. Prominent among these in England was Toynbee, whose *Lectures on the Industrial Revolution* (1884), published posthumously, exerted an influence quite out of proportion to its size and unfinished workmanship. A decade later Sidney and Beatrice Webb, standing much further to the political left, dealt with the same problem in their *History of Trade Unionism*, which with only very slight traces of political bias applied strict methods of research to the most recent and most controversial history. In the same period Ashley, a younger Oxford contemporary of Toynbee and the incumbent of the first chair of economic history in the English speaking world at Harvard, produced in his *Introduction to English Economic History and Theory* (2 vols., 1888-93) a strictly scientific synthesis; since the work never got beyond the sixteenth century it did not reveal in any direct way its author's spiritual debt to Toynbee.

Special aspects of recent British history were also handled thoroughly by Buxton in *Finance and Politics, 1783-1885* (1888) and Prothero in *The Pioneers and Progress of English Farming* (1888; expanded into *English Farming, Past and Present*, 1912). About the same time the output of industrial histories by men engaged in industry or closely connected with it, a characteristic British activity of the period from 1825 to 1875, tended to slacken. Notable exceptions are offered by Ellison's history of *The Cotton Trade of Great Britain* (1886) and Burnley's *History of Wool and Woolcombing* (1889).

During the decade from 1890 to 1900 the legal, institutional and economic history of the Middle Ages in England and elsewhere was illuminated by the towering personality, intellect and scholarship of Maitland. Although economic history proper was not his main interest, his *History of English Law* (in conjunction with Sir Frederick Pollock, 1895), *Township and Borough* (1898) and *Domesday Book and Beyond* (1897) did more for the comprehension of mediaeval economic life than many volumes of more spe-

cialized writing without genius behind it. The decade was also marked by the first outstanding contributions of American and Russian scholars to English economic history; Gross in *The Gild Merchant* (1890) and Vinogradoff in *Villainage in England* (1892) both worked from the legal and institutional side and with a German mediaeval background.

England had early attracted the attention of German scholars. The relative completeness of English records offered the opportunity of studying the peculiarities of early Teutonic settlements in so far as they survived on British soil, and for the modern period England was thought to present the classic picture of the agrarian, commercial and industrial revolutions. Nasse's study of the mediaeval village community and sixteenth century enclosures (1869) was translated into English two years after its appearance in Germany, and Brentano's essay on *The History and the Development of Gilds* (1870) was prepared and published in England. Gustav Cohn, an inductive economist by training, produced the still unequaled *Untersuchungen über die englische Eisenbahnpolitik* (2 vols., 1874-75) based on a close study of bluebooks and business records. Held's posthumous *Zwei Bücher zur sozialen Geschichte Englands* (1881) is a notable but uncompleted study of English industrial development from 1750 to 1850 by a German socialist of the chair. A quarter of a century later the Frenchman Mantoux produced an equally important study of the industrial revolution in England.

By the end of the nineteenth century economic history had not only acquired a definite territory and independence but it was coming to be recognized as a foundation study in the history of civilization. No student of prices needed to apologize for the supposed "meanness" of his subject after d'Avenel had illustrated in his *Histoire . . . de tous les prix . . . depuis l'an 1200 jusqu'en l'an 1800* (4 vols., 1894-98) the class making and class destroying power of price changes and Bonn had studied the effect of the price revolution on the decline of Spain in the sixteenth century (1896). It was not necessary to accept Marx' materialistic interpretation of history in all its crudity in order to agree with some part at least of what Engels called his great discovery: "that everywhere and always political conditions and events find their explanation in the corresponding economic conditions." The economic achievements and tragedies of the nineteenth century had made the writing of eco-

nomic history inevitable. "Things are in the saddle, and ride mankind." Detached study of how this came about had superseded the resort to history for the defense of policy or the illustration of preconceived philosophic doctrine. Not that a study so closely linked, to its very great advantage, with everyday things is likely to attain complete detachment from contemporary economic and social policies and contemporary philosophic conceptions. Ages read and write history by the light of their own knowledge and ideals, and they interpret it by their own experience. Although no conscientious scholar would deliberately write either "proletarian" or "bourgeois" economic history, only the most technical and therefore the least human history will fail to show some stamp not merely of the historian's age and philosophy but of his country and class or of the country and class to which his sympathies principally go out.

J. H. CLAPHAM

STUDY AND RESEARCH IN THE TWENTIETH CENTURY. *Great Britain*. Economic history had a place in Oxford and Cambridge historical curricula before 1880. With the death of Toynbee and Rogers and the passage of Ashley from Oxford to America, Cambridge became more prominent. Cunningham was teaching there and Marshall was at that time giving much attention to history. The foundation of the London School of Economics in 1895 as well as the establishment of economic curricula and increased attention to economic and social history in historical curricula at Cambridge, Oxford and other British universities tended to give wider scope to the study of economic history in Great Britain during the twentieth century. There was no professorship of economic history until 1910, when a chair was founded for George Unwin at Manchester, but there were many readerships and lectureships. A chair was founded at Cambridge in 1928 and at Oxford in 1931.

Monographs on social and industrial history began to appear from the London School soon after its foundation; and in close association with it were issued the volumes of Sidney and Beatrice Webb's great history, the *English Local Government*, of which the most strictly economic are those on *The King's Highway* (1913) and on the poor law (1927-29). Research work at the school was largely inspired by Mrs. Knowles until her death in 1926. Her *Industrial and Commercial Revolutions in Great Britain during the Nineteenth Century* (1921) and her *Economic De-*

velopment of the British Overseas Empire (1924) indicated the lines along which she had worked. She was assisted and has been succeeded by Tawney, the author of numerous works of which the most important are *The Agrarian Problem in the Sixteenth Century* (1912) and *Religion and the Rise of Capitalism* (1926), the latter traversing in a different fashion the ground covered earlier by Max Weber. A younger colleague of Mrs. Knowles, and now holder of the chair named after her, is Eileen Power, author of the *Medieval English Nunneries* (1922) and compiler of the critical bibliography of *The Industrial Revolution 1750-1850* (1927), published by the Economic History Society.

At Oxford Vinogradoff illuminated social history from the legal side in his *Growth of the Manor* (1905) and other works and inspired the monographs of the *Oxford Studies in Social and Legal History* (begun 1909). Oxford also supplied Lipson's *Introduction to the Economic History of England* (1915), which was limited to the Middle Ages. G. N. Clark, who was appointed to the newly created chair, has not been primarily an economic historian, but there is valuable economic work in his *The Dutch Alliance and the War against French Trade, 1688-1697* (1923) and *The Seventeenth Century* (1929).

At Cambridge Cunningham abandoned teaching early in the present century but worked over his *Growth of English Industry and Commerce* until 1910 (5th ed. in 3 vols.). Various teachers divided his work after his death. Of these Clapham, after the issue of his *Economic Development of France and Germany* (1921) and the first volume of his *Economic History of Modern Britain* (1926), was appointed to the new chair of economic history in 1928.

Unwin's professorship at Manchester was most fruitful. His knowledge of sources, mediæval and modern, was unique (see *Studies in Economic History*, 1927); in his last book, *Samuel Oldknow and the Arkwrights* (1924), he began that rewriting of the history of the industrial revolution with the aid of business documents which is being carried on by his colleagues and pupils in Manchester and elsewhere. The staffs of the younger British universities in the industrial centers and in Wales have all contributed to economic history and are acting as promoters of regional economic research. From Birmingham, until his retirement in 1925, Ashley encouraged this work. His own historical work had been laid aside since 1913, but his *Bread of Our Forefathers* (1928) was in the press when he died.

Under the leadership of W. R. Scott, formerly of St. Andrews, where he wrote the learned treatise on the early history of English, Scottish and Irish joint stock companies (3 vols., 1910-12), and now Adam Smith professor of political economy at Glasgow, work on Scottish agrarian and industrial history has been taken up. Earlier Cunningham had inspired similar work, some of the results of which were published in the *Scottish Historical Review* (quarterly, 1903-28). Miss Grant's *Social and Economic Development of Scotland before 1603* (1930) is a contribution to synthesis from a non-academic source. Valuable, widely read and controversial non-academic contributions to the history of the industrial revolution have been made continuously since 1911 by J. L. and B. Hammond; these include among others *The Village Labourer* (1911), *The Town Labourer* (1917), *The Skilled Labourer* (1919) and *The Rise of Modern Industry* (1925).

The stimulus given to local economic history by the issue of the *Victoria County Histories* (beginning in 1901) was checked by the difficulties of that enterprise during the war years. The work accomplished was unequal but some was of first rate quality. In every case the articles of this series form a starting point for further local research. The publications of local antiquarian and archaeological societies and of the Camden, Selden, Pipe-Roll, Year Book and other societies are constantly adding to the mass of printed sources without greatly reducing that of the unprinted. The volumes of the English Place-Name Society (published since 1924 under the editorship of Mawer and Stenton) are supplying important material for early history. Their publication is aided by the British Academy, which is also responsible for such volumes of its own as Stenton's *Documents . . . of the Danelaw* (1920). Among publications of the government of special interest to the economic historian the inventories of the Royal Commission on the Ancient and Historical Monuments (begun in 1910) and the archaeological work of the Ordnance Survey Office claim notice. The latter published Crawford's *Air Survey and Archaeology* (1928), which illuminated Celtic Roman and Saxon field history and has since issued remarkable maps of Roman Britain and seventeenth century England.

Recent activity in the field of economic history in Britain is reflected in the appearance since 1926 of an annual historical supplement of the *Economic Journal* and the foundation in 1927 of the *Economic History Review* edited by Lipson and Tawney. In addition to these fresh

outlets, original work in economic history continues to appear in the *English Historical Review*, in the *Transactions* of the Royal Historical Society and in the *Cambridge Historical Journal* published since 1923.

J. H. CLAPHAM

Continental Europe. On the continent economic history has reached its highest development and is most eagerly studied in Germany. In his books and papers on mediaeval town and agrarian history (*Territorium und Stadt*, 1900; *Der deutsche Staat des Mittelalters*, 1914) Below brought an acutely critical intelligence to the clarification of many puzzling problems. Although in general inclined to pay more attention to the legal and constitutional aspects of mediaeval institutions Below emphasized the primacy of economic factors in the origins of guilds and towns. Max Weber also dealt with Roman and early German agrarian organization, but his greatest contribution to economic history consisted in stressing the importance of the religious factor in various economic systems and thereby opening up a wholly new field of inquiry. His posthumous *Wirtschaftsgeschichte* (1923) is not a work in economic history but a treatise in sociological economics; it utilizes historical material for the illustration of the basic thesis, the victory of rationalism over traditionalism. Brentano's collection of essays *Der wirtschaftende Mensch in der Geschichte* (1923) traces economic evolution in terms of the disintegration of the primary economic unit and the resulting permeation of economic life with competitive acquisitiveness; he also published his lecture course on the economic history of antiquity (1929).

With the recent death of many of the outstanding figures in the field the stimulating effect of the works of Sombart and Dopsch has come more clearly to the foreground. Sombart's theories of the origin and development of capitalism have inspired a large number of important if controversial works. Both Below and Brentano attacked Sombart's generalizations on the subject, but perhaps the most telling attack was Strieder's *Zur Genesis des modernen Kapitalismus* (1904), a study of the accumulation of large fortunes at the close of the mediaeval period. Equally provocative was the thesis of the Austrian scholar Dopsch as to the persistence of the Roman agrarian institutions to the end of the Carolingian period, which he developed in *Die Wirtschaftsentwicklung der Karolingerzeit* (2 vols., 1912-13) and in *Wirtschaftliche und soziale*

Grundlagen der europäischen Kulturentwicklung aus der Zeit von Cäsar bis auf Karl den Grossen (2 vols., 1918-20).

Special and local historical studies have in this period been less concerned with agriculture and agrarian conditions and more with commerce and industry; the best of them deal with the Middle Ages and early modern times. This is doubtless due to the great importance of the towns in the history of Germany and to the decadence of the country in the seventeenth and eighteenth centuries; the great industrial and commercial development of Germany in the twentieth century has also contributed to this orientation of studies. Early in the century the publication of Schulte's *Geschichte des mittelalterlichen Handels und Verkehrs zwischen Westdeutschland und Italien* (1900) marked an important turning point in commercial history. Schäfer, whose best known economic work was done in Hanseatic history, and more recently Häpke, who studied the economic history of northern Germany and Holland, have also been prominent in this branch of study. Ehrenberg's *Das Zeitalter der Fugger* (2 vols., 1896), a classic of commercial and financial history of early modern times, belongs to the nineteenth century, but his studies of the great German industrialists (*Grosse Vermögen, ihre Entstehung und ihre Bedeutung*, 2 vols., 1902-05) come within this period. More recently Strieder's studies of monopolistic tendencies during the period of early capitalism (*Studien zur Geschichte kapitalistischer Organisationsformen*, 1914) and of the Fuggers (*Jakob Fugger der Reiche*, 1926) have claimed general notice. Ehrenberg's and Strieder's work is illustrative of a large number of studies published in Germany on the origin of large fortunes and on the history of individual families and business concerns which played a leading part in economic life. In another field is Theo Sommerlad's *Die wirtschaftliche Tätigkeit der Kirche in Deutschland* (2 vols., 1900-05); it drew attention to the significant role played by the church in mediaeval economic life.

This period was also rich in general treatises and comprehensive serial publications in economic history. A synthesis of universal economic history was recently completed by the anthropologist Cunow (4 vols., 1926-31). The very able summaries of mediaeval and modern economic history by Koetzschke (*Allgemeine Wirtschaftsgeschichte des Mittelalters*, 1924) and by the Russian scholar J. Kulischer (*Allgemeine Wirtschaftsgeschichte des Mittelalters und der*

Neuzeit, 2 vols., 1928-29; published originally in Russian in 1913), appearing as volumes of the general historical series edited by Below and Meinecke, bring together an enormous mass of monographic work on the subject mainly German in authorship. In 1918 Brodnitz began the publication of a *Handbuch der Wirtschaftsgeschichte*, which is to furnish manuals of economic history of the principal countries. The volumes so far published deal with England (1918), Russia (1925) and Holland (1927) and offer useful surveys.

The oldest scientific magazine in the field of economic history, *Vierteljahrschrift für Sozial- und Wirtschaftsgeschichte* (founded in 1893), continues as one of the most alert and useful organs, although it has lost the genuinely international character and scope which distinguished it before the World War. The activity of the learned societies, such as the Vienna Academy of Sciences (publisher of the *Oesterreichische Urbare*, 1904-13) and the Hansischer Geschichtsverein, was only temporarily interrupted during the war years and the period of post-war disorganization; they continue to publish sources of economic history and to stimulate research on the subject.

In contrast with Germany economic history in France had been rather neglected before the war. It was but feebly represented in university faculties, and learned societies gave it no attention. Only the period of the French Revolution seemed to attract attention, and the government encouraged its study by creating in 1903 a commission for the publication of documents relating to the economic history of the revolution. The commission's series of *cahiers* and of documents bearing on the sale of public lands are accompanied by valuable notes and commentaries and illuminate the history of the entire eighteenth century. It is only since the war that a strong current of interest in economic history in general has become apparent in France. The success of geographic studies, carried on since the opening of the century under the direction of such men as Vidal de la Blache, Brunhet and Demangeon, has focused attention upon the role of geographic factors in national economic development and has indirectly stimulated an interest in economic history. The initiative of a few scholars such as Henri Sée, who works primarily in eighteenth and nineteenth century economic and social history, and Henri Hauser, who ranges over the entire field of French economic history, was also in part responsible for

this change. In 1913 the *Revue d'histoire des doctrines économiques et sociales* (founded in 1908) changed its title to *Revue d'histoire économique et sociale*; this was intended to emphasize the connection between the history of theories and the history of institutions and to open the pages of the magazine to factual studies. Of greater importance has been the establishment in 1929 by M. Bloch and L. Febvre of the *Annales d'histoire économique et sociale*, whose success is a good omen for the future of the discipline in France. At present there is being published in France a series of general surveys of economic history and prehistory by periods. The volumes of this *Histoire universelle du travail*, edited by Georges Renard, tend however to run over into institutional and social history and are rather popular in treatment. The general historical series, *L'évolution de l'humanité*, published under the direction of Henri Berr, also contains special volumes on economic history.

The monographic work in France tends to neglect economic for legal and constitutional history; the mediaeval period is studied less intensively than in Germany. Thus no definitive work has as yet been done on such important problems as the significance of viticulture for mediaeval economy or the role played by the fairs of Champagne and the commerce of Marseille. Valuable contributions to mediaeval history have been made, however, by Georges Espinas, who has studied the cloth industry of French Flanders (2 vols., 1923) and the finances of the town of Douai in northern France (1902 and 1913); by Coornaert, the author of a history of the cloth trade of Hondschoote (1930); and by Hauser in his collected essays, *Travailleurs et marchands dans l'ancienne France* (1920). The interest of the French historians still definitely centers about the period of Colbert and the century of the revolution. Thus Boissonade and Hauser have studied the economic policy of Colbert, Paul Masson the history of the French trade with northern Africa (1903) and the Levant (1896) and Léon Vignols colonial commerce (1925). The agrarian conditions of the prerevolutionary period and the changes effected by the revolution have been illuminated in the important studies (1911-13) of the Russian scholar Luchitsky and in the later work done by Georges Lefebvre (2 vols., 1924), while the general economic history of the revolution is being intensively studied by Mathiez. In his history of French public finance after 1715 (5 vols., 1914-28) Marcel Marion also devotes considerable

attention to the finances of the revolution. An important contribution to industrial history of the modern period, a field which has been rather neglected, is Ballot's *L'introduction du machinisme dans l'industrie française* (1923).

In Belgium the advantages of location favored the early development of commerce and industry; it is natural therefore that Belgian scholars came to pay increasing attention to the history of these subjects. They came to it by way of the history of mediaeval towns, the institutions and social struggles in which could be understood only in the light of contemporary economic developments. Among the documentary collections on Belgian economic history may be noted the collection on the Flemish cloth trade, the greatest export industry of the Middle Ages, published by H. Pirenne and G. Espinas (4 vols., 1906-24). Of the individual studies several are worthy of notice. G. des Marez treated colonization in the Frankish period (in Académie Royale des Sciences, des Lettres et des Beaux Arts, *Mémoires*, ser. 2, vol. ix, 1926, sect. 2) in a way which shed new light upon the subject; he has also a study of the organization of labor in Brussels in the fifteenth century (1903-04). The agrarian organization in the Middle Ages has been studied by Verriest, and mediaeval money lending and finance by Bigwood. Goris' *Étude sur les colonies marchandes méridionales . . . à Anvers de 1488 à 1567* (1925) supplements and clarifies Ehrenberg's treatment in his *Zeitalter der Fugger*. Huber van Houtte produced several works on the economic history of Belgium under the *ancien régime* (*Histoire économique . . .*, 1920; *Les occupations étrangères . . .*, 2 vols., 1930) and compiled a series of documents on price history from 1381 to 1794 (1902). J. Cuvelier collected valuable materials on the statistics of population in the Middle Ages in his *Les dénombrements de foyers en Brabant (XIV^e-XVI^e siècles)* (1912).

While the Belgians are especially interested in the period comprising the Middle Ages and the sixteenth century, the Dutch historians are more attracted to the seventeenth and eighteenth centuries, during which the economic leadership of the world resided in Holland. Van Dillen's penetrating studies of Amsterdam exchange banks (1925) and of the Amsterdam guilds (1929) relate primarily to this period, while Posthumus' valuable history of the Leyden textile industry (1908) is limited to the Middle Ages, although the collection of documents on the subject compiled by him (6 vols., 1910-22) covers the years from 1333 to 1795. The popularity of the study

of economic history in the Netherlands is attested by the publication since 1916 of the *Economisch-historisch jaarboek*.

Although the economic development of mediaeval Italy was much in advance of all the other nations, the Italian historians have not as yet given adequate attention to the subject which comprises the eastward expansion of Italian commerce and the organization of commerce and finance in the different city-states. German historians like L. M. Hartmann (*Geschichte Italiens im Mittelalter*, 4 vols., 1897-1915), who has continued the work of Mommsen; Schaubé, a student of the commercial history of the early Middle Ages (1906); and Davidsohn, the author of a monumental history of mediaeval Florence (4 vols., 1896-1927), are responsible for the beginning of a scientific study of these topics. An important French contribution in this field is that of Yver (*Le commerce et les marchands dans l'Italie méridionale au XIII^e et au XIV^e siècle*, 1903). Recently an American scholar, E. Byrne, has drawn upon the rich notarial archives of Genoa for his valuable study *Genoese Shipping in the Twelfth and Thirteenth Centuries* (1930), and a Rumanian, G. J. Bratianu, has produced the instructive *Recherches sur le commerce génois dans la Mer noire au XIII^e siècle* (1929). There is no doubt, however, that in the future Italian investigators will pay increasing attention to the economic past of their country. Salvioni's study of capitalism in ancient Rome (1906), the work of Einaudi on the financial history of the eighteenth century and that of the late G. Prato on the financial and agrarian history of the seventeenth and eighteenth centuries indicate that an interest in economic history is not alien to Italian scholarship. The more recent publications of Saponi on the Florentine banking houses of the late Middle Ages (*La crisi delle compagnie mercantili dei Bardi e dei Peruzzi*, 1926) offer a most encouraging promise for the future.

This much too cursory survey has frequently mentioned the influence of the World War on the study of economic history. This influence must not, however, be overestimated; it is not at all comparable in importance to the profound changes which the war introduced into the study of general modern history. The economists have made and will continue to make the World War the object of their researches; the voluminous *Economic and Social History of the World War*, published under the direction of Shotwell by the Carnegie Endowment for International Peace, is an imposing example of such work. But for

economic historians the events growing out of the war are still too recent to be studied and understood in their true perspective. The war has not appreciably affected the viewpoints, trends of ideas or methods of work employed by economic historians, nor did it long disturb the actual prosecution of their work. Yet the time is ripe for a creative spirit to break new paths in research. Much can be gained in the future by emancipating economic history from limitation to the study of single nations and by adopting more frequently and more thoroughly the comparative method of research and systematization.

HENRI PIRENNE

ECONOMIC HISTORY IN THE UNITED STATES. Economic history may be studied from three distinct points of view. First, economic events may be presented simply in their chronological sequence; this type of study, economic chronology, early became dominant in America. Secondly, the historian may attempt to establish a sequence of filiation in the unfolding of economic events, devise perhaps a series of stages of economic development. This genetic approach is illustrated occasionally in American economic history, as in the work of Richard T. Ely, J. R. Commons, Isaac Loos and Blanche Hazard, but it is not much emphasized, partly because the history of America is so brief that it does not present a very long or distinct succession of stages. The third type of study attempts a logical interpretation of economic developments in terms of the external factors which affect economic arrangements, of the relations between the various parts of the economic system and of the influence of economic changes on social and political history. This approach to economic history has existed in the United States more or less from the first, increasing in popularity after the disappearance of the frontier in the 1890's.

The history of most countries has to account for the rise of an interest in things economic. In the United States, however, there never was an all prevailing religion or a political prepossession that smothered the economic realities of life. In the earliest pamphlets describing Virginia and New England, contemporary with settlement itself, there was a good deal of economic matter set forth—how the natives secured a living and what settlers had to do to survive or to get rich. The histories of provinces and states which appeared later also contain much scattered economic description. The works of Robert

Beverly, Alexander Hewatt, Jeremy Belknap and John Drayton are illustrations. Later histories, both local and national, such as those of McMaster and Channing, maintained this emphasis on the description of economic conditions as a basis for the historical presentation of the changes that had occurred since early settlement.

Official statistics have long constituted one of the most important sources for the study of American economic history. There were the early colonial reports to the Lords of Trade, the reports of the Treasury Department from 1790 onward and the decennial census enumerations. In 1810 manufactures were included in the federal census, in 1820 occupations, in 1840 agriculture and fisheries and in 1850 transportation. A notable *Statistical Table of the United States (1774-99)* was published in 1799; and private compilers published convenient summaries of statistical data—Blodget in 1806, Pitkin in 1816 and Seybert in 1818.

In America as in England the first special branch of economic history to be developed was commercial. In 1783 Lord Sheffield had maintained in a book which attained great popularity (*Observations on the Commerce of American States*) that while the colonies had gained political independence they must remain economically dependent. This was exactly what those erstwhile colonies had come to fear. In 1791 Tench Coxe made a notable reply to Sheffield (published later as *A View of the United States of America*, 1794) in which he made a real effort to deal with commercial development, although the material, chiefly statistical, was scant and the period covered (approximately from 1783 to 1791) was short. The occasional early efforts at a connected presentation of commercial history, such as the articles of Enoch Hale in *Hunt's Merchants' Magazine* from 1853 to 1856, were not well developed.

The disastrous monetary and banking experiments in the first half of the century led to much controversial writing and induced Gouge to compile *A Short History of Paper Money and Banking in the United States* (1833). Other writers followed—Hildreth in 1837 and Dealtry in 1858. Toward the end of the century A. M. Davis published a number of works bearing on the history of colonial banking and currency; the same period marks the beginning of the literary activity of Davis R. Dewey, the author of numerous scholarly works on the history of American currency, banking and public finance.

The history of manufactures lagged behind

monetary and financial history except in so far as it was included in commercial, particularly mercantilistic, treatises. The first important treatment was J. Leander Bishop's *A History of American Manufacture from 1608 to 1860* (2 vols., 1861-64), which provided a compendious survey that was at once comprehensive in chronological sweep and in the number of industries covered. It had the great merit of describing particular firms and factories. Later the work was done more systematically by Victor S. Clark under the auspices of the Carnegie Institution. Special phases were dealt with by Malcolm Keir (manufacturing) and R. M. Tryon (household manufactures, 1917), while histories of separate industries were done by Bagnall (early textile, 1893), M. T. Copeland (cotton, 1912), A. H. Cole (wool, 1926), Charles B. Kuhlmann (flour milling, 1929) and others. An early history of railroads and canals was done by Poor (1860) and illuminating insights into the history of American railroading were afforded by John Moody in his *Railroad Builders* (1919).

It is a curious fact that the history of agriculture, America's primary industry, received no separate treatment until very late. In the decade from 1916 to 1925, however, several books were written or edited—by Sanford (1916), Carrier (1923), L. B. Schmidt (1925), Gras (1925) and Bidwell and Falconer (1925). Only the last named authors aimed at exhaustive treatment and they dealt only with the north and stopped at 1860. Many more special studies must be made, particularly of significant regions, before anything like an adequate general story can be told of American agriculture. In 1919 the Agricultural History Society was formed, and since 1927 it has been publishing a quarterly called *Agricultural History*.

The general economic history of the United States was undertaken surprisingly early and, as was to be expected, with only partial success. In 1861 L. Stebbins, the publisher of popular books in Hartford, Connecticut, issued a sizable volume entitled *Eighty Years' Progress of the United States*. Various writers contributed the different chapters—on agriculture, the cultivation of cotton, the steam engine, trade, transportation and manufacture. The editor was aware that he was doing something new, but he was not peculiar in holding to the view that America's chief contribution up to his time had been economic. A neglected but notable general outline was A. S. Bolles' *Industrial History of the United States* (1879). It was intended originally as a cooperative

work, but only Bolles kept up his enthusiasm and eventually wrote the whole book. Although it is a fairly inclusive treatment this work is strongest on the side of manufactures and for the period after 1800. In 1905 Katherine Coman wrote the first adequate *Industrial History of the United States*; although meant as a general textbook it is really a scholarly work. In 1909 G. S. Callender edited a volume of selections on American economic history, for which he wrote a number of stimulating introductory essays.

A recent tendency is the regional division of general economic history for more effective treatment. Regional studies such as Weedon's on New England (1890), Hartsough's on the northwest (1925) and U. B. Phillips' on the old south (1929) promise a degree of reality and a wealth of detail not possible in a national presentation. In this connection it must be mentioned that the work done and encouraged by state and regional historical societies (Massachusetts, Illinois, Iowa, Mississippi Valley) is largely economic in character.

Interest has been added to economic history by the emphasis upon the economic factor in American civilization. In 1893 Turner pointed out the significance of the frontier for American life; Beard applied the economic interpretation to the establishment of the federal constitution (1913), to the origin of Jeffersonian democracy (1915) and indeed to American history generally. These points of view were also adopted by a number of scholars working on more detailed problems in general American history.

American economic history has not always sprung from native soil or home conditions. At Harvard, Dunbar, who had just returned from Europe, began in 1883 to give a course on the economic history of Europe and America since 1763. In 1892 Ashley, appointed to the first chair in economic history, brought English and German methods and points of view to Harvard. Since 1902, except for a period of about five years, Edwin F. Gay has lectured on the subject at Harvard and has come nearest to founding a school in America. His emphasis has been upon the quantitative method and upon minute careful research in selected fields. At Columbia, Edwin R. A. Seligman began in 1886 a course of lectures on the financial and industrial history of the United States, and in 1905 Simkhovitch, whose interests lie primarily in the field of European agrarian history, was appointed to the new chair of economic history. Following the lead of Harvard and Columbia three universities—Yale,

Minnesota and Buffalo—have established professorships of economic history. Recently Harvard has been fostering research in business history; a professorship in business history has been established and the *Journal of Economic and Business History* has appeared quarterly since 1928.

Historical economics came to America not only through Ashley and Gay at Harvard but through various scholars who had studied in Germany. Although they were not themselves economic historians Herbert Baxter Adams and Richard T. Ely at Johns Hopkins University and H. W. Farnam at Yale assisted in developing the economic point of view or in collecting economic historical data. Economists have frequently written their dissertations in economic history and have often sought historical backgrounds for their special theoretical interests, notably Taussig in tariff and Commons in labor study.

The outstanding effort to organize work in economic history on a large scale was made under the auspices of the Carnegie Institution. A great deal of money was spent in collecting material. The various volumes that have appeared on American commerce, transportation, manufactures, labor and agriculture display unequal merit. They are useful compilations of facts, however, and contain valuable suggestions as to source materials.

Economic history in America has had no leader to produce a monumental work upon which others might build their reputations either by following or by criticizing it. The universities have generally neglected the study of economic history, apparently regarding it as a very special subject. There has been a lack of controversy, even of intellectual resilience, in the field.

N. S. B. GRAS

ECONOMIC HISTORY AS A DISCIPLINE. Economic history is a branch of general institutional history, a study of the economic aspects of the social institutions of the past. Its methodological distinctiveness hinges primarily upon its marked quantitative interests; for this reason it is or should be the most exact branch of history. But it is often difficult or even impossible to introduce quantitative treatment into the institutional study of the subject. Thus for all but the most modern period the absence of statistical material may make only very rough and uncertain quantitative treatment possible. Even such simple questions as the membership of guilds

or early trade unions, the sizes of villages and towns and the ratio of wage earners to non-wage earners in industry at different dates often defy accurate answer.

It would not be difficult to give some simple aspects of institutional history a more quantitative and graphic treatment than they have generally received. Maps of England in 1300, 1400 and 1500, marking the principal towns at each date and indicating those which are known either to have had well developed craft guilds or not to have had them and those about which information is lacking, might prove most instructive. So might maps based on *Domesday* and the Hundred Rolls of Edward I, indicating those villages which appear to have coincided with the manor and those which do not. Such elementary quantitative statements, which could be made more easily for mediaeval England than for most countries because of the relative perfection of the English records, can, however, only touch the externals of institutions and illustrate the frequency of institutional types. In the study of institutional organization and function quantitative methods are usually inapplicable and the method of economic history differs in no way from that of history in general.

Should the records happen to be abundant, quantitative treatment of the economic aspect may become possible and very fruitful. *Domesday Book*, a tax book with some of the features of a census, is primarily an economic and only incidentally a legal and institutional record. From the "valets" of *Domesday* an almost exact "business" statement has been worked out (see Corbett, in *Cambridge Medieval History*, vol. v, ch. xv) of how William of Normandy assigned the shares of England, taken over as a going concern. It was to the abundant business records of English landowners (bailiffs' accounts, etc.) that the quantitative method in mediaeval history was first applied on a large scale by Thorold Rogers; it provided series of price, wage, crop yield and other statistics over long periods. The quantitative method is still being applied and the records have still much to furnish. For some countries, e.g. Spain, the comprehensive study of price records has only recently begun.

For handling the records of the economic history of the ancient, mediaeval and early modern world the necessary training is mainly that of the general historian—the linguistic, epigraphic and palaeographic knowledge appropriate to the age and country studied. For the ancient world epigraphic knowledge is particu-

larly important because the literary sources contain little precise economic information. It is only to the study of the most recent history, that of the last century and a quarter and particularly of the last half century—the age of census and other official statistics—that methods requiring any but the most simple statistical knowledge can profitably be applied. But the study of price history for any period for which records are reasonably abundant, i.e. for any period since the twelfth century, requires familiarity with contemporary methods of price inquiry and with the elementary principles of index numbers. For the most recent period a fairly complete statistical equipment is necessary, because the abundance and variety of the statistical material permit the application of some of the more refined statistical methods. This work tends therefore to fall into the hands of the inductive economist, who is only secondarily a historian.

Every economic historian should, however, have acquired what might be called the statistical sense, the habit of asking in relation to any institution, policy, group or movement the questions: how large? how long? how often? how representative? The requirement seems obvious; but a good deal of the older politico-institutional economic history was less useful than it might have been through neglect of it. The latifundia were not so representative of Roman economic life in the early part of the first century B.C. as historians once supposed. Many theories of urban origins which have found support among continental scholars break on the question “how representative.” The manorial map of England might put the manor village in its proper place. The political importance that has sometimes been assigned to the English trading companies of the sixteenth century has been greater than is warranted by their economic importance as understood at present. American scholarship has reduced the economic hardships inflicted by the old colonial system to their proper and rather limited size. Many accounts of the industrial revolution in Great Britain would hardly suggest that in 1830 only one person in eighty worked in a cotton mill: they omit to state clearly “how many.”

Neglect of the question “how representative?” vitiates most of the schemes, made particularly by German scholars, for scheduling states in economic development. Such schemes besides concealing the variety of history may confuse logical with temporal succession. The most general of them was that of Bruno Hilde-

brand, which postulated the sequence of natural economy, money economy and credit economy (“Natural-, Geld- und Kreditwirtschaft” in *Jahrbücher für Nationalökonomie und Statistik*, vol. ii, 1864, p. 1–24). Its drawback when applied to history has been that the labeling of an age as one of natural economy may easily lead to neglect of evidence for the coexistence of other types of economy. Thus prolonged research and controversy have been required to establish the fact that the early Middle Ages in northern Europe were not ages of pure natural economy. Moreover, the term natural economy may cover both exceedingly simple and very complex economic systems. Exchange in ancient Egypt was predominantly that of goods for goods; but Egyptian civilization had little in common with that of primitive Germany or of primitive modern societies in which money is unknown. And since, except in prehistoric and in the earliest historic times, money using and non-money using societies have always existed side by side, since remnants of natural economy have long survived and still survive in money using communities, and since credit in some form appears at a very early stage in most civilizations and never completely dominates any, the assignment of a particular age or even of a particular society in that age to one or other of the stages becomes a delicate problem of fact and of degree scarcely worth attempting.

Similar but more destructive criticism applies to the stage scheme of Karl Bücher (*Die Entstehung der Volkswirtschaft*, 1893), based on that of Schönberg of 1867 (“Zur wirtschaftlichen Bedeutung des deutschen Zunftwesens im Mittelalter” in *Jahrbücher für Nationalökonomie und Statistik*, vol. ix, p. 1–72, 97–169), with its succession of self-sufficient domestic economy, in which there is no exchange but every household meets all its own needs; town economy, in which the goods pass directly from producer to consumer and from countryman to townsman; and national economy, in which intermediaries between producer and consumer appear. Bücher claimed that the whole course of economic development, at least for the peoples of central and western Europe, could be brought under this scheme. But it most certainly cannot. It is impossible to distinguish such stages with precision in the history of those peoples; and the first two are arbitrary conceptions not corresponding to any known group of historical facts, although it is easy to find places and periods in which most households have been comparatively self-

sufficing or in which the simple intercourse between small towns and the surrounding country has been dominant. Although stage schemes have furnished convenient categories for the classification of economic phenomena and have provided scholars with Max Weber's "ideal types" with which the varied reality may be contrasted, they have done more harm than good to the study of economic history. They may be specially harmful when history is being summarized for the use of students.

The inevitable breaking up of economic history into periods for convenience of study and teaching has some of the dangers of the stage schemes, if period and stage are unduly identified or if the period specialist loses perspective through relative ignorance of what went before and came after the age of his choice and so is unable to select for special attention those of its features which are of the greatest general significance. These are the ordinary dangers of historical periodization and specialism. The tendency of economic history to take over ready made the conventional divisions of general history has at times produced unfortunate results but need not do so. Clear dividing lines purely economic in character do not exist or at least have not yet been generally agreed upon. If periods are recognized as simply slices of time, within which some particular economic phenomenon—slavery, economic feudalism, early capitalism, corporate capitalism—may be of special importance but not necessarily to the exclusion of phenomena of other types, their study has no serious drawback. It is, however, probably even more important in economic than in other branches of history that period study should be associated with adequate study of the contemporary world, the *terminus ad quem*.

Stage schemes in economic history were devised mostly by members of the German historical school of economists, who attempted to substitute, as it were, historical generalization for economic theory. Most scholars are now agreed that such an attempt failed even in the hands of Schmoller. The central problems of economic theory, although they may be stated in terms of some particular historic phase, are in essence independent of history. In theoretical discussion it is necessary to isolate forces and factors in a way which history does not permit. Even more important than this independence and the necessity for abstraction is the fact that the absence from all history, except that of the latest statistical age, of enough trustworthy se-

quences of ascertained facts makes impossible the exact treatment at which theoretical inductive economics aims. Even the statistical age has not yet supplied nearly enough tested sequences of facts for the economist's needs, and the necessarily defective historical record will scarcely satisfy him. For example, there can be no exact discussion of English unemployment before 1886, when certain trade union statistics were first issued. There are countries in which such exact discussion is hardly possible even yet. Generalizations about the unemployment complained of in Shakespeare's *Henry VIII* (act i, scene 2) or even about that in Lancashire at the time of the American Civil War will give the contemporary economist little help. The historian recognizes that except in price history and other quantitative sections of his work his results will be on a lower plane of truth than that to which the fully equipped inductive economist may conceivably attain. It remains true, however, that some parts of economic theory, such as the succession of industrial types, the evolution of money and the problem of population, are or purport to be generalizations from history.

The relation of economic history to social history is much closer. It is true that with certain aspects of social history the economist as such is not concerned, unless he is in a position to trace the play of economic forces upon them. For example, his interest in costumes, manners, recreation and non-economic ideals may be limited only to such aspects as the clothing of India in Lancashire cotton, the aping of the millionaire, the professionalizing of games and the commercializing of ideals. But as the main concerns of society are and always have been economic, by far the greater part of social history, it may be argued, is simply economic history. As a critic of particular social histories the economist's main question will tend to be "is this representative." The social historian may with fairness reply to such criticism that he deliberately studies society at leisure with more care than society at work, because in the spiritual history of mankind the important matter is the use made of time saved from the plow or the machine. To this there is no conclusive rejoinder; but plow and machine remain important and representative. The economic historian, on his side, can hardly afford to be ignorant either of non-economic social history or of general history. If he is, he will almost certainly mistake the importance of the economic factor

in any group of historical factors. It is unfortunate that the progress of specialization tends to increase rather than reduce this risk.

The links between economic history and human geography as now studied are similarly close. Although in the strict statistical or institutional treatment of economico-historical problems geographical considerations may be irrelevant, they obviously are relevant to the wider economic history which would trace the evolution of societies getting their living in particular environments and altering those environments in the process. How far and in how much detail geographical description should be introduced into economic histories depend on the scale of the work and the amount of knowledge which may reasonably be expected of the typical reader. The geographer must describe; the historian may often assume. But it should be said that economic history as hitherto written has much more often suffered from neglect not merely of geographical description but even of essential geographical considerations than it has erred by incorporating too much geography. It would be easy to cite agrarian histories which almost ignore climate and soil. The modern school of anthropogeographers, on the other hand, makes full use of the conclusions of economic history and sometimes even writes it, although with a geographical bias (e.g. Brunhes and Deffontaine's *Géographie humaine de la France*, 2 vols., 1920-26). It is much to be desired that there should be a closer union between the two studies. The inevitable overlap at this or any other margin is not dangerous: it is at the overlapping margins of disciplines and sciences that the most important discoveries are usually made.

ECONOMIC INCENTIVES. The discussion of economic incentives in the social sciences has thus far centered round the simplifying assumption of the "economic man" introduced by classical economics and combated both by socio-ethical and by historico-realist criticisms in Anglo-Saxon and continental countries. The recently growing belief that scientific adequacy lies not so much in rigid systems but rather in more flexible renderings of a changing reality has brought up the question whether that whole controversy has not been vitiated by the common presupposition of a too static character of economic incentives, and whether it is not time to reconcile the conflicting views by admitting the dynamic elements of a "verified" or "applied" theory without foregoing the advantages of functional analysis and systematic understanding.

A comparison of precapitalistic and capitalistic society discloses the merely relative validity of both positions—that of the upholders and that of the opponents of the concept of the economic man. Precapitalistic society, as it is seen preserved today not only in primitive or colonial surroundings but in farming districts and communities everywhere in the midst of capitalistic society, is by no means devoid of even strongly

prevalent acquisitive and commercial instincts. But there seem to be two differences between these and the normal economic attitudes of capitalistic man: the one psychological, the other institutional. First, the ways in which the acquisitive spirit is here mixed with and overlaid by non-economic incentives are perhaps not more prominent in degree but doubtless divergent in structure from those that have rightly been recognized in capitalistic systems. Secondly, and in close interaction with the first, the institutional medium of money and market economy appears to exercise a pervading influence on the texture of economic and non-economic motives in social behavior. The slow breaking up of closed nuclei of household economy, such as the European peasant proprietor farm or the older forms of the small family household, shows very clearly, on the one hand, a rising dependence on markets for the sale and purchase of formerly non-marketed or unmarketable goods and services and, on the other hand, a corresponding increase of money reckoning and of degree of rationalization in the economic relations of the individual members of those communities to each other and to the nucleus as a whole. But of course this process in most instances means a transformation rather than a first emergence of economic incentives.

A critical study of the forms and transformations of economic incentives will therefore have to start from two fundamental considerations. One of them is that the conditioning of all social life by the need of providing the material instruments of physical and mental existence raises everywhere and at all times the question as to how economic incentives underlie social behavior and that it is unrealistic to think of any age or community as exempt from this economic predetermination. It is not less important, however, to inquire to what extent the specific transformation of economic incentives due to market economy and a rationalization of social relations generally results in actual isolations or accentuations of these incentives and thus justifies, at least for this development, the assumed psychology of the economic man as a reflex of an "economization" of society at large. Such a study of incentives does not rest content with the cheap solution given to the problem by most textbooks, viz. that the classical assumptions have to be interpreted as exclusively applicable to intermediate and instrumental motives, means toward other ends, and that these ends themselves are independent of a merely

rational, commercial or acquisitive motivation. Evidently in any realistic social psychology there is no possibility of such a mechanical separation between intermediate and final incentives. It is doubtful whether the character of an incentive as purely or even overwhelmingly "economic" is in empirical research capable of being very distinctly set off against non-economic spheres.

The aim of study must rather be the shape or structure of whole complexes of incentives present in a given economic situation or system. The question always is how far that structure is influenced by what we may term preexistent types of individuals or races approaching economic action from their own different angles, and how far such typical differences of attitude are in their turn to be traced to social and consequently economic developments. One might inquire in this connection how far the ascertainment of non-economic or extra-economic incentives might be only what Marxian socialists call an ideology, i.e. a fallacious interpretation of economic incentives as non-economic either by the illusions of observers or by the mistaken consciousness of the actors themselves. The search for such ideologies has proved increasingly a double edged tool, for the ideology of social class warfare itself has proved both how easily a purely economic motivation is transubstantiated into a partly unreal sentiment and, vice versa, how easily the economic interpretation of history is in its turn instigated by economic and social instead of scientific incentives.

So much the more urgent would become the construction of a typology of motives in economic life. This is sometimes attempted as a mere coordination of psychological constellations such as would correspond to recent German research into the systematic varieties of *Lebensformen* (Eduard Spranger) or *Weltanschauungen* (Karl Jaspers) or the numerous modern essays in "characterology." Thus an American writer on "non-commercial incentives" (P. H. Douglas in *The Trend of Economics*) distinguishes: the desire to benefit humanity; the fascination, or joy, of the work itself; the desire to project one's own personality into the work at hand; the desire to be esteemed by one's fellows in the same field of activity; the desire for the esteem and approval of the general public; the craving for notoriety; the desire for power over men and over things. But there can be hardly anything final or exhaustive in such enumerations, even if they are drawn from descriptions of actual situations and habits that may be much more

valuable. A chief difficulty seems to lie in the curious fact that, while the naturalistic doctrines of social development under pressure of material environment are in constant need of being supplemented by the study of relatively stable human types, the latter study must in its turn be wary of neglecting the influences of change and evolution, whether individual, racial or generally historical. It is significant that the psychology of social types has latterly been inspired and supplemented by psychological theories of the ages of man and of the alternation of generations. And even apart from this it might be asked, for example, whether the kind of "general public" or of "power over men and things" conceived of as the object of non-commercial incentives is not apt to differ so radically in different social systems as to leave scarcely more than a nominal clue for the realistic explorer.

All this leads at first sight very far from the inner field of economic theory where the discussion of incentives first cropped up. On closer inspection, however, the embarrassing wealth of the modern psychology of social motives will not have been fruitless for the restatement even of the "pure theory" of economics. In this respect research seems to advance on two main lines. For once, the emphasis of the concept of economic incentives has shifted from its older moral side, the gainful or hedonistic setting of social purposes that shocked the socio-ethicists and historians, over to its intellectual side, which in the beginning hardly used to be debated at all. The question now raised is whether the commercial incentive in a market and money economy could work on the basis of a complete knowledge both of the relevant data of the market and of the individual's most advantageous relation to these data. It is the thoroughgoing alterations in the structure of enterprise and competition due to "late capitalism" that have opened the debate on this second and perhaps more important aspect of economic motivation and renewed for it the question whether there is any reality corresponding to the concept of omniscient economic incentives. The negative answer to this question is one of the socialist strongholds in the battle for the displacement of competitive by planned economy. A possible affirmative would have to narrow down still further the theoretical concept of competition and the competitive or entrepreneurial unit.

In this dilemma a second methodological device has sometimes been considered. Just as marginal analysis has gradually left behind its

eggshells of individualist Robinson Crusoe psychology for new objective statements, general economic theory has tried to avoid the tedious quarrels regarding either the moral or the intellectual implications of the *homo oeconomicus* by simply neglecting incentives in the description and analysis of economic functions—much as behaviorism wanted to dispense with the equivocations of motive in general psychology and sociology. Economic behavior as the broadest and to a large extent unconscious or sub-conscious strata in the complexes of social action must appear particularly conducive to such an abstraction from subjective motives. This is especially true in modern standardized mass society, not only because of the "law of large numbers" asserting itself despite numerous individual deviations but also because of the objective force of economic institutions that act for man as well as through man. The modern form of the concept of the economic man and its counterpart, that of the complete individual, or the sociological man, are thus apt to fall into line with something like J. B. Clark's distinction between "functional" and "personal" distribution, in so far as the first stresses the automatic character of economic interplay, whereas the second stresses the range of actual social deviation from the mean, but within the limits of this interplay. Here too socialism has contributed largely to a refining of the primitive classical psychology of economic incentives, from the time when Marx in the famous foreword to the first edition of *Das Kapital* announced his intent to treat of capitalists and landlords not as persons but as "personifications of economic categories." On the other hand, it is socialist theory that reopens in full breadth the question of incentives by its doctrine that gradual or revolutionary changes of social institutions will necessarily entail new types of man and social action, replacing the acquisitive by the functional society and the exploitation of property by the "instinct of workmanship," the spirit of public service or even an "anarchy" of "love" after the model of religious sects.

ECONOMIC ORGANIZATION. See ORGANIZATION, ECONOMIC.

ECONOMIC POLICY. The term economic policy may be used broadly to comprehend all government action in the economic sphere—more or less deliberate government intervention in production, distribution and consumption. Economic policy in this sense is as old as are established governments; for no government however constituted can exist without civil and military functionaries whose service must be paid for in some way. The raising and spending of revenue is the most primitive and at the same time perhaps the most important branch of economic policy.

Economic policy is sometimes an end and sometimes an instrument of a government's general policy: it is dependent upon and must greatly influence such policy. Wealth as a particular kind of power is sometimes desired for power's sake, as by the mercantilist statesmen who favored foreign trade as a means of making their country rich and thereby powerful; on the other hand, power has been freely used to acquire and to preserve wealth as an object worthy in itself; colonial expansion as a "shopkeeper's" policy has been built on a display of military force; free trade depends for its undisturbed flow even in times of war either on naval supremacy or on international agreements.

No deliberate economic policy can arise be-

fore a clear comprehension of the working of economic forces has taken root in the minds of the groups constituting governments. Economic theory, however, is not the parent of economic policy; historically the converse has been true. Apart from mediaeval theories, which were by-products of ethics and theology, the more important modern economic theories have developed out of violent discussions of the merits of rival economic policies. The theory of money owes more to controversies about the debasing of coins and about the control of the influx into Spain of the precious metals from the New World than to the early academic discussions about circulating medium. And the theory of international exchange was evolved by the mercantilist traders and statesmen in justification of the methods and purposes of their policy. Neither Friedrich List's theory of productive forces nor Karl Marx' construction of surplus value can be properly appreciated as abstract theoretical propositions. The former is a justification of a desired economic policy; while the latter, regarding the nature of things as stronger than government control or labor combinations, provides the argument for a policy of non-intervention.

But although theory develops late and although most actual economic policies have failed to conform to the tenets of pure economic theory, nevertheless the influence of economic thought on economic policy has been enormous. Statesmen and business men are much inclined to dispose of unpleasant and unanswerable arguments as "mere theories," but they have always been eager to justify measures they advocated by quoting theories or if necessary by manufacturing them. During the height of inflation in Germany after the World War the more learned advocates of inflation quoted Knapp's *Staatliche Theorie des Geldes* (1905); their less learned colleagues evolved their own theories.

Economic policy has assumed an increasingly dominant place in modern society as a result of the growing importance of wealth and, with the possibility of its acquisition by other than warlike activities, the greatly increased efforts of governments to control its flow. The difference between a tribal cattle raid and the modern spoils system, whether manifested in corrupt municipal government or in the logrolling of highly respectable business interests, is rather technical; but the important feature of the modern creation of wealth is that it no longer consists merely of transfer from one owner to another but results from a regular process of production. Its place

in the accepted moral order has moreover been completely reversed. In the classical world its possession was considered essential to the functions of full grown citizenship; its acquisition, on the other hand, was regarded as derogatory. Christian morality tolerated the possession of wealth if properly used but discouraged its acquisition in so far as commerce tied its practitioners to a material world instead of making them strive for the kingdom to come. As long as such views prevailed, economic policy remained limited to a repressive or police function, that of preventing people from cheating each other and from endangering their souls by indulging in luxuries.

With the growth of the modern state and modern economic organization the situation has completely changed. Expanding nationalism was dependent on power which could be achieved and organized only by the creation not by the mere transfer of wealth. But the state could not create wealth without encouraging and protecting its subjects in the pursuit of it. Economic policy thus ceased to be a by-product of ethical assertion; it became one of the main branches of government activity.

Economic policy involves more than reliance on strictly economic measures. Most economic policies depend for their success on some form of coercion, at times open, at times carefully veiled. Territories are occasionally bought by one government from the other, as in the case of the Alaska purchase, but most territorial expansion has been carried out by military force. Governments have sometimes avoided direct expropriation of property by offering attractive compensation, as in the case of the earlier stages of Irish land purchase or the abolition of slavery in the British Empire; but more often expropriation has been effected by direct seizure or by coercive legislation, as occurred in the abolition of slavery in the United States.

The growth of economic interests has not only influenced the relation of nations to each other, shaping in many ways their foreign policy; it has also affected internal political organization and functioning. The outstanding political issues of the western world before the modern era were religious and constitutional. The religious issue has been settled in most countries, as far as it can be settled, by legislation. Although its traces on institutions and ideas are still visible, religious conflict has ceased to be of dominant importance. Constitutional issues too seemed on the way toward settlement until they were revived and

complicated by the growth of economic interests and theories. The spread of parliamentary democracy had theoretically done away with the dualism between sovereign and people; the state when controlled by its citizens is identical with the nation and can safely be entrusted with national tasks. But it has everywhere become evident that this "monism" is purely formal. Although in most countries the people as a whole enjoy unfettered sovereignty, nations are split up into groups, classes, estates, interests. The vital issue has shifted from the division of power between the rulers and the ruled to the safeguarding of one part of the people against encroachments by the other parts. The function of government can therefore no longer be restricted to the maintenance of order and justice. The division of the national dividend and the ownership and control of the productive plants which yield it have become the main objects of political struggle, the real goals of political parties. Even those who do not accept the Marxian view that the forces of production are the main determinants of social organization, and groups to whom a commonwealth means more than the sum total of the economic activities of its members or of its governing body, no longer deny the preponderant importance of economic factors. It is therefore natural that economic policy should have taken the place of religious and of constitutional policy as the most important branch of statecraft.

Economic policy may be direct or indirect. A government which itself plans and organizes the production and distribution of goods and services among its citizens is engaged in direct economic policy. It runs economic institutions, as it runs its army and its navy, as direct concerns of the government. If such a policy embraces all economic activities, technical production as well as distribution, and centers them in the state, this is possible only under a system of complete regulation (*Planwirtschaft*), such as exists in a communistic form in Soviet Russia.

Where production and distribution are left entirely to private initiative, to individuals or groups who are either self-sustaining or engaged in supplementing one another's needs by barter or commerce, economic policy is indirect only. It consists mainly of some form of intervention by laws and regulations in the making and the disposing of commodities. The degree of such government intervention has varied greatly in different societies but has never been completely absent; for the social institutions indispensable to economic life, such as private property or

contract, are either created or maintained by government intervention. The absolute free play of economic forces in a given society always presupposes an established social order enjoying the protection of the law. Moreover, no government has completely refrained from direct intervention in economic activity, in so far as all governments raise taxes and spend their proceeds.

Where production and distribution are left to private enterprise, economic policy and economic activities are theoretically strictly separated. In actual practise, however, this is never true: even non-socialist governments indulge in a good many economic activities, such as the postal service or transportation. On the other hand, private units, like the chartered companies of the seventeenth century, have at times been entrusted with government functions and the execution of economic policy. Governments may carry out direct policies by delegation, as in the case of most central banks or the Russian trusts. Whenever a government shows signs of breaking up, private groups among its citizens are more than willing to take over its economic policy. Thus for several months after the German revolution of 1918 the country's economic policy was in the hands of a board composed in equal parts of representatives of labor organizations and employers' federations.

The economic activities of groups not entrusted with political control must not be confused with economic policy, although they often greatly influence it. The fixing of monopoly prices by a trust or cartel or the fixing of wages by collective bargaining may even be done in defiance of a government's economic policy. But the government's attitude toward such activities and the efforts of such groups to have some economic practises made legal and others illegal are among the important determinants of economic policy.

Despotic governments can be supposed at least in theory to be free from the pressure of economic groups and their interests—able to formulate conceptions of the common good in the economic field and to translate such ideas into action without fear of being called to account. But under a representative government it seems impossible to secure the adoption of an economic policy which has the general welfare as its main object and severely disregards sectional interests. When governments are formed or controlled by economic groups, the efforts of these groups become quite as much a part of economic politics as are the activities of political parties,

whose programmatic policy becomes practical policy only when they assume office. When, for instance, trade unions in Australia run a caucus, which forms and controls governments, or when such groups as the Reichsverband der Deutschen Industrie or the Landbund in Germany can secure cabinet posts for representatives who have never been in politics, their share in the formulation of economic policy cannot be ignored. It is out of the abuses inherent in such a situation that the demand for an omnipotent dictator derives its force.

The ultimate goal of economic policy has been the same in all ages and in all countries: the prevention of scarcity as a negative, the assurance of plenty as a positive, aim. In primitive societies direct methods are relied upon for the achievement of this goal: consumers' goods are carefully stored whenever a surplus is available, a situation illustrated by the story of Joseph in Egypt; or again control may be applied directly to consumption, as was attempted in mediaeval legislation against waste and luxury.

With increasing complexity of economic organization intermediate steps in the control of wealth become of greater importance. Before the development of modern productive techniques plenty could be assured only in the last analysis by control of land and of the people who worked it. Not infrequently, however, the possession of gold or silver, supposedly representing non-shrinkable purchasing power, has been considered the criterion of plenty. Perhaps the most notable instance of the acceptance of such a belief and its practical elaboration is to be found in the mercantilism of sixteenth and seventeenth century Europe. The partial breakdown of the mercantilist system in France brought a return to older conceptions: to the physiocrats plenty seemed possible only in a properly organized self-sufficient commonwealth, where the land yielded regularly a net surplus over all costs. The mercantilist doctrine, however, has never entirely disappeared from economic theory nor lost its sway over economic policy.

In England Adam Smith and the classical economists combined the physiocratic emphasis on the necessity of a regular flow of consumers' goods with a doctrine based on an elaborate system of money values. Plenty to them became cheapness. Their ultimate aim was the satisfaction of human wants by ever increasing quantities and varieties of goods and services, with ever decreasing efforts. Low or rather falling prices became the final goal of liberal economists of the

nineteenth century. According to their own theories this was a goal difficult to attain in view of the law of diminishing returns and the supposed tendency toward too great an increase in population, which made scarcity rather than plenty the probable fate of mankind or of some at least of its less favored strata.

The policies advocated by this group did not stand unchallenged. An excessive agricultural population might secure cheapness in certain commodities by producing raw materials on a low standard of living and depending for its manufactured goods on imports from abroad. On the other hand, a protective tariff would give to that population employment in nascent industries and free it of foreign dependence. As Friedrich List, for instance, saw it, the development of productive powers for the production of plenty was more important than cheapness due to foreign imports. Objections came also from another angle. Since low prices depended on cheap labor and cheap labor was long supposed to be equivalent to low wages, the laboring groups did not care much for this sort of plenty; they preferred regular employment and high wages to technical progress, falling prices and an ever increasing volume of satisfaction for human wants, if these led to unemployment and falling wages. To an increasing number of theorists interested in the laboring class plenty seemed best assured by the accumulation of capital goods (plants) in the hands of the commonwealth, from which by a proper process of distribution an adequate supply of consumers' goods would automatically flow.

It is essentially this physical, non-monetary conception of plenty which lies at the base of the economic policy of Soviet Russia as well as of the economic order advocated by modern industrialists. But the paradox of modern capitalist society is that although modern technical progress has made the achievement of plenty easy and although low labor costs can be combined with high wages, the resulting cheapness is a danger to the business structure rather than a boon and attempts are continually made to prevent its occurrence. Although welfare and wealth no longer preclude each other and wealth can be increased without danger to health or the suppression of a part of the population, the full possibilities of plenty have not yet found expression in modern social organization.

A systematic survey of economic policy might be undertaken from many angles. Each country and each historical period has had its own eco-

nomic policy, modified by special circumstances. Moreover, each type of economic activity—agriculture, commerce, fishing, banking, manufacturing, insurance—may be an object of governmental control. A state will have a population policy and an income policy. Where such separate policies are not part of a general economic program they must produce in practise very unexpected results. There can be no agricultural policy which is not at the same time an industrial policy. The fixing of wages in industry is not merely industrial policy; for it may by withdrawing labor make agriculture unprofitable. No system of economic policy can be built upon such divisions. Each general system, however—liberalism, state socialism, socialism—emanating from a principle of its own must include programs relevant to each of these aspects of economic life.

Economic policy has up to the present derived only from individual governments, each regulating the production and distribution of wealth in regard to its nationals. The regulation by any country of goods and services crossing its frontiers is bound, however, to affect their movements over a second frontier, and all really important national economic measures will be followed by international repercussions. Thus the splitting up or the large estates in south-eastern Europe after the World War greatly reduced for some time agricultural exports from the countries involved and affected the world wheat market. Separate discussion of foreign and domestic economic policy is therefore probably not the most fruitful approach.

A systematic grouping might be attempted by dividing economic policy into direct policy and indirect policy, as defined above. All activities directly undertaken by the government, especially public expenditures, would be considered under the first heading, while indirect policy would embrace all government intervention in the activities of persons or groups engaged in economic occupations, including perhaps taxation.

The main field of indirect policy today is what may be called price policy; for in an economic system built upon exchange governments intervene most often by adjusting or regulating prices between the different groups exchanging their services at home and abroad. Tariff making, valorization and price fixing are forms of price policy in the commodity market. Usury laws and credit control in its various forms affect the price of capital; rent legislation is price policy applied

to land. In the field of labor factory legislation is an indirect price policy, while a compulsory eight-hour day or compulsory social insurance or the legal guaranty of a living wage is a direct price policy. Price policies may also be distinguished as special and general; the former is designed to affect one or more special groups of commodities, while the latter involves an attempt to shift the entire price level by monetary policy or centralized credit control.

Price policy does not, however, cover the whole field of governmental intervention. The transformation of social institutions, such as the abolition of certain forms of property or of private property in general, can scarcely be carried out quickly enough by mere price regulations, although money compensation or heavy taxation may facilitate such changes. Nor can colonial expansion be left entirely to the play of prices, although an example of marked success in this direction exists in the Wakefield system of colonization. Economic policy is largely directed toward the creation or destruction of institutions—peasant proprietorships, the proposed reorganization of the English coal mines, abolition of the guild system or of slavery. The totality of such efforts might be called institutional policy. It would embrace such very different actions as the annexation and settlement of land abroad and the creation of new legal institutions at home. It is the most important branch of economic policy whenever the final stage of transition from one social system to another, which must often be marked by governmental action, is necessary. The transformation, from 1570 to 1609, of the tribal system in Ireland into a system of feudal tenure could not have been accomplished without far reaching legal changes. And the transition from feudalism to modern property rights was brought about almost everywhere by legal intervention; where there was no such intervention, change was effected in time by agrarian revolutions.

Price policy and institutional policy account for most government actions in the economic sphere. But there is a large subject with which they deal only indirectly: population. The attempt of governments to increase or decrease the quantity or to improve or deteriorate the quality of population is only partially due to economic motives; it can rarely be carried out by economic means. Neither the increase of population favored by militaristic governments nor the expulsion of heretics, such as the Jews and the Moors from Spain or the Huguenots from France, was

advocated because of economic reasoning. On the other hand, the admission of the Huguenots into other lands was the result of a deliberate economic policy and did produce very important economic results. Motives are most often mixed: American or Australian immigration policy is the outcome partly of a desire for the creation of a biologically superior race and partly of the wish to maintain high wages. Since men and women are consumers of goods as well as sellers of labor, the character of a population will always influence and be influenced by economic policy. But neither quantitative nor qualitative population policy, including such subjects as eugenics and migration, can be treated exhaustively within the scope of institutional policy or price policy. The Malthusian endeavor to explain the growth of population by reference to the influence of falling or rising wages and to explain the reaction of wages to the fluctuations of population as a special case of supply and demand was not very satisfactory. Therefore it would be well to add population policy to institutional policy and price policy as a third important branch of economic policy.

One of the main causes of the rise of systems of economic policy has been the existence of various states enjoying more or less favorable geographical positions, possessing varying economic strength and facing each other as rivals and opponents. For plenty has but a relative meaning when the needs of the citizens of one country are contemplated; its real significance is brought out by comparison with neighboring or rival states.

Throughout primitive and early times no people or state could consider itself safe from hostile pressure or from the danger of scarcity if its natural resources were not sufficient for the satisfaction of the needs of its people. As a result a common and frequently recurring policy of governments has been the attempt to make their own country self-sufficient by developing its natural resources and by banning foreign imports. They have usually aimed at the same time to secure some sort of economic domination over foreign nations by making the latter dependent on goods imported from their own surplus resources. In its developed form this becomes the program of mercantilism—the effort to hamper imports while fostering exports, to raise and export a surplus of goods of prime necessity while reducing imports to mere luxuries.

Where a country did not possess sufficient natural resources for permanent self-sufficiency

it usually attempted to gain them by territorial expansion. For a very long period the main end of economic policy was land and its main weapon was war, although federations and purchase were sometimes resorted to. The economic policy of primitive tribes—the acquisition of lands, flocks and warriors by force of arms—does not differ greatly in essentials from the ways of the Norman knights who conquered and despoiled the Irish or of the colonial Boers who needed and took farms for their numerous progeny. Conquest, the main economic policy of tribal and feudal days, has retained its importance in modern times. The huge annexations of the past century have sometimes been caused by national aspirations or by the need of military security, but most of them have been closely connected with the desire for wealth and self-sufficiency. The policy of creating a completely self-sufficient empire by forceful territorial expansion has been tried by many nations; as a complete policy it has failed conspicuously, for population and resources have never and nowhere balanced so nicely as to do away with the need for exports or imports.

A fairly complex network of trading relations was early built up by the nations surrounding the Mediterranean basin, many of which, such as the Ninevites and Phoenicians, gained almost their entire wealth through their position as commercial intermediaries. The later Roman Empire was dependent on international trade for its food supply and consequently directed its economic policy toward the fostering of stable commercial relationships throughout the territory under its control. With the breaking of these ties in the Middle Ages governmental effort was directed toward the avoidance of scarcity rather than the procuring of plenty; getting rich even by trade became a rather one-sided transaction, generally consummated by superior force or superior skill and closely related to fraud. In a feudal society stability of status and income was desirable, change and increase of wealth were dangerous; trade was admissible only between nations where nature apparently made it unavoidable. The growth of the large colonial empires of the early modern period did force the less favored countries to resort to a regular system of trade with them. Indeed, the belief that international trade was a proper method for enriching a country was the indirect outcome of these grandiose efforts to create self-sufficient empires.

Colonial expansion was the concrete expres-

sion of the feudal theory of wealth; the foreign trade policy of the mercantilists, on the other hand, reflected the views on wealth of the commercial classes coming into power in Holland and England. Although governments and governing classes might prefer territorial expansion to trade expansion, the natural limitations of the former soon made the fostering of international trade the popular, almost universal object of economic policy. Territorial acquisition has been, however, an important means of enrichment until very recent times, when the revolt of subject nationalities has checked political colonization, the place of which has largely been taken by capitalistic colonization, the penetration of foreign capital into backward countries.

But the theory of domination has left its imprint on the opposite policy of getting rich by trade. Even if trade is mutually beneficial it may be so regulated politically as to make one party gain more than the other. The mercantilist merchants, regarding gold and silver as the most important objects of exchange, favored the semi-monopolistic organization of trade by governments in order to insure the scarcity of commodities the supply of which they controlled and thus to establish the dependence of foreign customers and their contribution to the wealth of the monopolizing country. This method of economic control has survived into modern times. The Stevenson scheme for restricting rubber production is closely related to the Dutch corner in cloves. And the more or less monopolistic control of capital markets has often enabled the richer countries to make the poorer countries subservient to their policy economically as well as politically. Economic pressure, based on the more or less monopolistic control of wealth, is as coercive as conquest. Even the conduct of trade on the basis of equality and reciprocity does not preclude some sort of regulation. A free trade tariff raised for revenue purposes only still considerably influences the flow of goods between countries.

Deliberate purposeful regulation of foreign trade has taken various forms. The early schemes of organization under which governments or agencies created by governments directly exchanged with each other fixed quantities of specified commodities disappeared as a system long ago, although economic dislocation following the World War revived such variants of it as the quota system as well as the use of embargoes and prohibitions. By the middle of the nineteenth century the place of such direct controls had

been taken by more or less systematic tariff legislation, designed to enable governments to adjust the relations between foreign and domestic prices as well as between the prices of protected and unprotected domestic goods. Protection, whatever its motives may be, is a method of regulating prices by political control. Attempts have occasionally been made to fix or stabilize prices through tariff regulation. More frequently the purpose has been limited to the fixing of increments to be added to the unregulated fluctuating world market prices. Protection does not necessarily apply only to commodities; the flow of labor and of capital over international frontiers can be similarly affected by immigration or emigration legislation and by the control of foreign loans. Protection may also be achieved by more direct economic means, such as the payment of subsidies, the granting of assisted passages to immigrants or the guaranty of interest on loans.

Government control of trade, although it is not, like annexation of territory, open coercion, contains as does all government action some compulsory elements. Coercion has existed in domestic economic policy as well as in foreign relations. Governments have forced their subjects to produce certain goods and prevented them by force from the consumption of others. Physical force or the fear of it as the ultimate motive for obeying the law has at all times underlain economic policy, as it has other forms of government activity. The history of taxation alone is a proof of this fact.

The outstanding attempt to construct an economic policy based on the absence of government intervention and political coercion was that of the nineteenth century liberal school of economists, especially the group known as the Manchester school. This group advocated unhampered and unfettered private initiative as the best way of bringing about both an increase in the national dividend and its more equitable distribution. To them intelligent self-interest seemed a more effective economic motive than docile obedience to the plans of some benevolent but despotic government. To function safely such self-interest had to work under a system of free competition which could not be achieved before monopoly in all its different forms was destroyed. Free competition was regarded not so much as an end in itself but rather as a means to an end: plenty for all, decline in prices and in costs of labor but not necessarily in wages, and ultimately ever increasing satisfaction of such human wants as

are dependent on economic goods and activities. Once such a system was established, government control became according to its proponents superfluous, even injurious; since the system was the best which could be produced, its artificial correction would diminish the maximum satisfaction enjoyed by all the members of the commonwealth.

Non-intervention might be a legitimate policy—if abstention from action can be called policy—within a society whose institutions were adapted to function without such control. But such a society must itself first be created by institutional policy. As the physiocrats had not expected their system to work until “the rule of nature” was established, so the Manchester school demanded the repeal of the corn laws to destroy feudal monopoly and thus make room for the free play of economic forces and advocated the creation of peasant proprietors, by compulsion if necessary.

Liberalism did not succeed in establishing a commonwealth based on free competition, for nowhere did there exist ideal conditions to permit the working of such a system. They were most nearly approximated, perhaps, in the United States after the opening of the west. But although the monopoly of land was there to some extent broken, modern industrialism immediately created everywhere new quasi-monopolistic institutions. The preponderance of fixed capital has assimilated the structure of many industrial concerns to that of monopolistic landholdings. From a technical point of view systems of transportation or great power centers are worked best on non-competitive lines. Where monopoly is thus useful, it cannot be prevented; and where it exists, governmental non-intervention is impossible.

When monopoly prices are combined with competitive prices, a well balanced automatic adjustment of the economic mechanism can no longer be relied upon. Non-intervention where monopoly exists is equivalent to control by monopoly. Deliberate governmental price policy of some sort therefore becomes unavoidable. Such control has assumed various forms. Governments have in some cases taken over the monopoly plants, for example, railway systems, and run them either in such a way as to derive the maximum profit in the interest of the taxpayer or at cost prices in order to supply essential economic services as cheaply as possible. In other cases the ownership and management of monopoly have been left to private groups but the fixing of prices

has been made subject to government consent, as in the German coal and potash industry; regulation may take the form of limitation of profits in an inverse ratio to prices, as with many public utilities in the United States or the railways in Great Britain; or the monopoly may be forced to turn over all profits above a certain level to the public treasury, as must be done, for instance, by the German Reichsbank.

Several factors combined since the beginning of the nineteenth century to cause a revival of doctrines of economic control. Among the more important were the growth of population, the opportunities of employing the increased numbers offered by industrialization, and the rise of nationalism. One of the chief exponents of the new theories was Friedrich List, who not only formulated the theory of protection of nascent industries but also started that alliance between economic protection and sentimental nationalism which has recently spread to the new countries of eastern Europe as well as to colonies or former colonies striving for emancipation.

This "new protection" conciliated the business classes with the state or rather with the bureaucracy which they had formerly opposed, since the state was now to intervene, by the imposition of customs duties, in their interest and with their active cooperation. These business groups continued, however, to insist on a policy of non-intervention so far as labor conditions were concerned. They argued that no efforts should be made to shorten hours or to protect women and children; nor should the combination of workers to raise wages be permitted, since this would make labor a monopoly and endanger the accumulation of capital, the dearth of which would ultimately bring about unemployment or lower wages, outcomes the more serious since the artificially raised wages would unavoidably have led to the increase of population.

Such views might convince the working class in a free trade country where plenty was assured by low prices, but they lost their persuasiveness when the state intervened to give higher profits to selected industries. Moreover, while the trained bureaucracy of continental countries had occasionally advocated non-intervention, they had never meant to abolish themselves or the principles of control for which they stood. The growth of nationalism and democracy led to bitter conflicts between such bureaucratic organizations and the new economic groups, but the outcome was a strengthening of the principle of control. Patriarchal despots had always viewed

the struggle of the laboring class in another way than had governments which had been taught the gospel of non-intervention by religious and political revolution. They might oppose the political claims of laborers but were often willing to intervene to protect health as against mere wealth. A democratic government served by highly trained specialists may be similarly inclined to interfere to protect the workers whenever national welfare seems to demand such action.

Marxian socialism although radically revolutionary in its general principles was really quite as non-interventionist as was orthodox liberalism. For since the revolution and the ensuing expropriation of private property envisaged by Marx could come only at the end of a long period of evolution of the economic system, government intervention even in the interest of the working class must be regarded as rather useless. Working classes thoroughly imbued with this teaching might disbelieve in government intervention; but they can scarcely refuse it when offered in the shape of factory legislation or social insurance; and they demand it when their organizations become sufficiently strong. Trade unions which can make or mar governments, as in Australia, early insist on state intervention especially in the regulation of wages. When such regulations are assured, labor becomes an enthusiastic advocate of tariff protection. It is generally true that where wages are kept rigid by labor unions or where governmental wage fixing is not only tolerated but made compulsory, the working class does not object to intervention even if such action hampers production, increases the number of unemployed and throws a heavy burden on the taxpayer.

Instances of government intervention for social purposes can be found in all countries and all periods, but the modern theory of state control was developed in Germany. German philosophy had created the conception of a superstate in which all of the nation's activities could be comprehended. German romanticism and German historicism combined in identifying this purely abstract state with the existing bureaucratic government. It remained for the younger members of the German historical school, especially some of the *Kathedersozialisten*, to invent the mythos of the bureaucracy: state socialism. This new program was put into practice on a huge scale through Bismarck's system of social insurance. It has since spread throughout the world, taking the form of Fabianism in England,

of the Wisconsin idea in the United States and, finally, when combined with the mediæval idea of the corporate commonwealth, of Fascism.

What was really state socialism became almost universal during the World War and the subsequent period of dislocation. Throughout the course of the war the scarcity of goods compelled most belligerent governments to put into effect a policy of price fixing accompanied where successful by rationing. Military leaders, business men, trade union officials and civil servants combined to feed and clothe their nations according to more or less systematic plans. For the first time in modern history governments really dominated economic life, partly because they controlled the centralized purchase of goods, partly because they could insist on unquestioned obedience. This war control was rapidly abandoned in most countries with the cessation of hostilities, but traces of it have survived everywhere, for example, in the housing policy of the German government.

The post-war period has seen the development of a wide variety of new economic programs. Throughout most of the world hopes of a kind of after war millennium had been raised; instead, people found themselves facing new dangers and dislocations. Inflation had demonstrated the ease of bringing about rapidly a complete redistribution of the national income; it had, on the other hand, destroyed the feeling of security on which pre-war societies were built. Concurrently the attitude of many people toward government radically changed. Parliamentary government on a democratic basis had become prevalent throughout most of the world, but now the faith in such government almost completely disappeared. It was seen that parliamentary majorities are in large part built up by sectional and usually conflicting economic interests joined in unholy alliance, to the cost of other groups; and that the loyal observance of their respective economic creeds by political parties had become rare, until the distinction between compromise and corruption appeared very hazy. Experience with the purely selfish intervention of such governments resulted in the revival of a spurious Manchester creed. Economic minority groups who are not strong enough to enforce government intervention in their own interest or who pay for the benefits of intervention accruing to other groups have in recent years been protesting loudly against state intervention in general and demanding a return to a policy of complete economic liberty.

This protest took in some quarters the form of a demand for what has been called self-government of industry; a similar system was advocated by workers under the slogan of "industrial democracy." The essence of this program was the organization of industries by collective arrangements between employers and employees and the placing on each industry of responsibility for settling its problems, wages as well as prices and in some schemes even taxation, without the intervention of the political government, which was to be reduced to its most primitive functions. Unfortunately in many of these schemes the welfare of consumers was ignored. It should be noted that this movement was not based on a demand for free competition or free trade. Rather the plan was to combine each industry in monopolistic organizations, if possible on an international basis similar to, but more far reaching than, the steel cartel. It was essentially freedom for, not from, monopoly that was demanded. The foundation of the Bank for International Settlements in 1931 was greatly influenced by such desires of important business interests to emancipate finance from government. In the labor world guild socialism played with similar ideas.

The war had shown how quickly economic issues could be decided, provided the executive was not hampered by parliamentary responsibilities. When it was over, social friction, class warfare, inflation and want seemed to have come to stay; nothing, so it seemed to a generation who had learned to obey orders, could be accomplished in that chaos of mutually destructive economic interests which was represented by modern parliamentary democracy. Careful planning had been done on an enormous scale during the war. Why not create a dictatorship in peace time which would appoint a sort of general economic manager of the nation's total economic life, budgeting for her wants and their satisfaction in a scientific way? From such more or less indistinct feelings several new conceptions of economic policy arose, all based on the conviction that action is primary, that there are no immanent economic laws which cannot be controlled by intelligent organization, that such economic organization is a technical problem and that coercion and obedience are better springs of human activity than self-interest and individual initiative.

The first of the new schemes based on these assumptions arose in Germany. Known as "economic planning" (*Planwirtschaft*), it was based on the German bureaucratic tradition and the

conviction of that bureaucracy that centralized administration was more efficient than individualistic production and distribution. The program of control was supported by business interests whose monopolistic organization had accustomed them to consider administration and business as identical, and it found strong advocates among the many socialists to whom expansion of government activity seemed to be a step toward socialism. It did not, however, get beyond the stage of planning. The general concept of planned control put its mark on large sections of German economic life—housing and coal mining, for example—but without the development of a general key plan, producing thus merely a jumble of free industries and of controlled industries.

Far more important has been the Fascist experiment. In place of bringing about that freedom from economic intervention which its original supporters greatly desired it has become the outstanding exponent of state socialism, somewhat in the line of the German *Katheder-socialismus*. The Fascist state has united the great groups of producers, employers and employees in compulsory organizations, building up a kind of social hierarchy. It has not abolished private property and money exchange, but it leaves the operation of neither to the influences of free competition. At every stage it regulates, interferes, controls. It represents a kind of combination of the mediaeval state, formed of an agglomeration of more or less stabilized corporations, with the absolute despotic government of the mercantilist era. Its ideal is a kind of socialism assuring stabilized if unequal incomes. Bismarck's policy of protection, social insurance, government enterprise and obedience resulted in a system really not very different from the Fascist achievement and was not even very remote from the Fascist theory.

The rise of the Soviet state has proved the greatest solvent of older conceptions of the possible scope of economic policy. For it can no longer be denied that economic activities can be carried out by a centralized government, which uses its subjects as employees with considerable efficiency. In Soviet Russia enthusiasm, fear and obedience have been used as motive power equivalent to the self-interest and the economic pressure on which the capitalistic world has relied. The Soviet system does not need private property as an incitement to work nor the power of the capitalist to squeeze a surplus value from the laborer nor his avarice for accumulating such

surplus to be applied to production. It does accumulate as ruthlessly as its greediest capitalist predecessors. Working with the modern techniques developed by the capitalistic world it has in a brief period shown remarkable economic development. Whether this is greater than that of capitalistic societies during similar periods of industrial revolution under favorable circumstances is doubtful. Apart from the vast institutional changes brought about by the abolition of private property the Soviets' economic policy is, however, not very original. It offers many parallels to the period of late mercantilism, when ruthless bureaucratic governments industrialized their countries by brutal force without consideration for the sufferings of the population, especially the agrarian population. Even the delegation of administrative authority from the central government to trusts has parallels: the mercantilist governments systematically applied their policies with the help of especially organized privileged chartered companies.

Even groups and countries which have not adopted any such radical and inclusive economic policies have been experimenting with partial forms of economic control. But these have not produced economic order. The piecemeal intervention practised has for one thing attracted capital to protected industries which have expanded far beyond existing demand. Where such industries are strongly organized, as in the case of the German cartels, they can make profits on the inflated capital by maintaining prices at home through curtailing output and dumping the surplus abroad. Their partial success may then lead to the advocacy of international cartels to raise in world markets the prices which have been lowered by such dumping. Valorization and import monopolies are expected to confer on agriculturists similar benefits not achieved by agricultural protection in its more simple forms. It is coming to be generally recognized that throughout the world a faulty distribution of capital has taken place, partly as a result of piecemeal intervention. The remedies most frequently proposed are increased intervention through increased protection, monopolization, valorization.

The main object of modern price policy is shifting from the provision of the public with cheap goods in order that they may satisfy their wants on an increasing scale to the guaranteeing to each group of a fixed price for the services it has to render, regardless of the cost of the ultimate output. Modern techniques and modern business organization are widely held to be ca-

pable of producing a national income sufficient to provide a comfortable standard of living for all. Concurrently there has been a revival of the mediaeval idea of a stabilized fixed income determined according to acknowledged hierarchical class standards. Price fixing carried out according to such a conception differs widely from the old protectionist policy; it has become absolute rather than relative. For the attempt to add a definite tariff increment to a fluctuating world market price there has been substituted the aim of fixing an absolute price with the help of indices and sliding scales. The income of the different classes of society, the price they receive for their services, is no longer to be determined by the price the finished product will fetch in the ultimate market; it has rather become a prior lien on that ultimate price which is supposed to cover the income costs of all contracting parties. When this conception eventuates in a policy of fixing wages regardless of yields it is pretty generally denounced by the employing class as "political" wage fixing. It is less frequently pointed out that tariff making to enable combinations to exploit the home market non-competitively is also political price fixing and not essentially different from the fixing of wages in a like manner.

None, however, of these methods of fixing prices, wages and profits or of eliminating risks can be used for the benefit of every economic group, nor can they be expected to yield the same results in all cases. Price policy so far has been a piecemeal affair, its main object discrimination. Indeed, if the various protected interests gained and lost equally by intervention, there would be no call for it. The fruits of intervention thus far have been a much greater range and diversity of prices than existed under a more nearly competitive system, and a very wasteful distribution of capital.

As special price policy has failed to achieve economic order, attention has shifted to the possibilities of a general price policy. Inflation and deflation have clearly shown that treasuries and central banks, which control the issue of money and credit, can easily raise or depress the price level of a country. It is true that in periods of inflation changes do not take place at the same time everywhere; there is considerable lag in the prices of different kinds of commodities; rigid incomes do not follow suit. Nevertheless, money and credit control makes possible a far more uniform and general price policy than the specialized measures embodied in tariff or wage regulations. It makes fairly easy a national redistribu-

tion of income, for during inflation creditors' claims are whittled down and debtors' burdens greatly eased. Many thoroughgoing interventionists advocate the manipulation of credit issues with the object of stabilizing or even raising prices a little whenever employment is slack.

Central banks, working in close cooperation with treasuries, control credit largely by the use of discount policies. The chief object of discount policy in most countries has been the stabilization of foreign exchange. The supporters of a general price policy suggest another aim: stabilization of the price level. As discount rates regulate the cost of short term credits they regulate too the flow of working capital and affect indirectly the valuation of fixed capital and its distribution, through the stock exchange, among various industries. They affect moreover foreign lending or borrowing and by their influence on the price level the volume of imports and exports. Interventionists have long realized that the control of the flow of capital is the problem most in need of solution. It has been attempted by means of tariffs or by control boards for public loans, such as the German *Beratungsstelle für Auslandsanleihen* or the Loan Council in Australia. There has been shamefaced control of foreign loans in the United States and quite unabashed control in France. Several governments have guaranteed their nationals against losses on loans to Russia. All such measures are more or less haphazard. But it is widely believed that the systematic manipulation of money and credit issues by the central banking authorities would overcome this difficulty and make possible a scientific general price policy by which employment would be increased, taxation eased and nations made rich and contented.

It is largely because the possibilities of such credit control are undoubtedly very great that the power has been so far removed from the sphere of politics. Most existing bank laws forbid banking authorities from embarking on arbitrary general price policies and limit their activity so far as possible to the anticipation of automatic price movements. It is very doubtful whether a widening of these activities is desirable. On the one hand, the possibilities of manipulation are probably overrated. Discount policy might achieve much where free competition was prevalent; it is, however, not so effective in a society where important groups cling tenaciously to rigid prices, whatever the general price trend may be. Moreover, such an extension of authority would involve great political danger.

The cry for cheap money has been raised in many places—by the extreme laborites in Australia as well as by the German Nazis. Such demands can be fought successfully only where rigid banking laws exist. It is perhaps wiser to maintain such guaranties against hasty action of central banking authorities or undue influence by sectional and temporary political pressure.

The time has passed when governmental intervention in economic affairs was considered a crime against immutable economic laws. But it is not so certain that the benefits of intervention, apart from institutional changes, are so great that any society should aspire to experience its maximum development. The automatic wisdom postulated by the liberal economist as resulting from natural equilibrium in a purely competitive world may well be doubted; but the terrible lack

of equilibrium which can result from centralized intervention must not be ignored. Intervention may be wise; but it can be wise only if those who exercise it are full of wisdom. And as this is by no means a certainty, intervention ought not to be made too easy.

ECONOMICS

THE DISCIPLINE OF ECONOMICS. Economics deals with social phenomena centering about the provision for the material needs of the individual and of organized groups. It was once maintained that in order to claim the right to a separate existence an intellectual discipline must have a distinct subject matter and a specific methodology. As tested by this criterion the above definition is highly unsatisfactory: the line of demarcation between the subject matter of economics and that of other social scientific disciplines is very shadowy, and no mention is made of a special methodology. Yet to make this definition more specific would be to enter at once into the realm of controversy, to engage in a battle of words, in which slightly different nuances of definition disguise radical differences in approach and emphasis in the study of the subject. Economics, which has long been and will perhaps ever continue to be the battle ground of rationalizations

for group and class interests, has suffered more than any other discipline from the malaise of polemics about definition and method. Economics was defined as a science of wealth and as a science of welfare; it was spoken of as centering about the business enterprise and as including the entire range of economic behavior; it was declared to be essentially abstract and deductive or essentially empirical and descriptive; it was proclaimed by some as a science and by others as an art. The modern student regards these controversies not as dispassionate attempts to attain by logical means to eternal verities, but as the reflection in one field of changes in *Zeitgeist* and of shifts in the class structure of economic society. He is more frankly concerned with specific problems suggested by the thousand and one maladjustments in the functioning of the economic system; and he endeavors to bring his intelligence to bear upon their solution without concerning himself with the question whether the problems

are purely economic in character or whether the procedure employed is in line with the approved methodology of economics. For his purposes the broad definition of economics given above should be entirely adequate; it indicates that economics is a social scientific discipline and that it is concerned with the relations of man to man arising out of processes directed to the satisfaction of material needs.

The shift of emphasis and succession of points of view may be traced even in the history of the name of the discipline. The term economics is derived from the Greek *oikonomike*, denoting the management of the household (*oikos*), which became in application to the household of a free commonwealth (*polis*) political economy. At the close of the Middle Ages the Greek nomenclature was taken up by French writers. In 1569 Prudent le Choysselat published a *Discours oeconomique*, which dealt primarily with an agronomic question. In the meantime Aristotle's conception of politics had made headway and the term "police" began to be used for the science of government. In 1615 there appeared Montchrétien de Watteville's *Traicté de l'oeconomie politique*, in which he argued that, contrary to the Greek view, "economy" must not be separated from "police" because "the science of wealth acquisition is common to the state as well as to the family." He identified "political economy" with the public housekeeping (*mesnagerie publique*), which included not only government finance but also the *bonne police*, or regulation of agriculture, trade and industry. Montchrétien's example was, however, not at first followed. As late as 1745 Claude Dupin wrote his *Oeconomiques*; in 1750 the *Oeconomische Nachrichten* was started; and the physiocrats were soon called simply *les économistes*. In Italy Genovesi advocated the term civil economics and Ortes national economics; but they met with little success, although in Germany the term *Nationalökonomie* had considerable vogue in the nineteenth century.

In England Petty was the first to speak of "political economies" and of "oeconomicks" in the sense of "political arithmetick." It was not until the next century that police became common. Hutcheson in his *System of Moral Philosophy* (1755) speaks alternately of "oeconomics and politics" and "civil polity"; and Adam Smith devoted his lectures of 1763 to "justice, police, revenue and arms," including under police "cleanliness and security, cheapness and plenty, commerce and manners." Steuart's *Inquiry into*

the Principles of Political Oeconomy (1757), however, popularized the term political oeconomy, so that Adam Smith refers to it alternately "as a branch of the science of a statesman or legislator" and as a discipline dealing with "the nature and causes of the wealth of nations." By the beginning of the next century the new discipline was everywhere called political economy.

During the nineteenth century economics became a self-conscious discipline: much attention was paid to method, to the distinction between economics and related disciplines and to the divisions between various schools of economic thought. In this connection sporadic attempts were made to apply new names: Whately suggested catallactics, or the science of exchanges; Hearn used plutology, or the science of wealth; and Ingram insisted on chrematistics, or the science of money making. These were intended in almost every case not merely to indicate more clearly the content of classical economics but to prevent a complete identification of economic science with this system of economic thought. For this reason such attempts were bound to prove unsuccessful. A more important change came toward the end of the century, when economists became aware of the fact that political economy was too narrow a designation for a discipline which dealt with economic relationships and economic change in society, often without reference to political factors. The new name preferred was economics or social economics, the latter particularly in Germany. The pioneers in this respect were Mayo-Smith (*Statistics and Economics*, 1888), E. B. Andrews (*Institutes of Economics*, 1889), Pantaleoni (*Principii di economia pura*, 1889) and Dietzel (*Theoretische Sozialökonomik*, 1895); but perhaps most credit is due to Marshall, who in 1890 published the first *Principles of Economics*.

One reason for preferring economics to political economy is that the discipline had ceased to be a system of inquiries with a direct bearing on questions of economic policy as it had been in the eighteenth and early in the nineteenth century. After a certain point has been reached, the comprehensiveness of the body of principles and the abstractness of methods employed in establishing them have led to a clear cut separation of theory and practise. In England Senior's *An Outline of Political Economy* (1836) was probably the first to draw attention to the rigidly abstract and hypothetical character of economic theory and to distinguish theoretical economics from the art of economics serving the needs of the

statesman. In Germany such a separation was favored by the fact that the system of economic theory received from England was combined in general texts with a *réchauffé* of old cameralism under the name of applied, or "practical," economics. Later this division into theoretical and applied economics became crystallized into a separation of theory and policy. But even in German speaking countries this division was not universally accepted. In his *Allgemeine Volkswirtschaftslehre* (2 vols., 1900-04), for example, Schmoller included under each topic a historical introduction, a statement of principles and a discussion of policy. The collective *Grundriss der Sozialökonomik*, begun in 1914, breaks entirely with the old divisions. In other countries the distinction between pure and applied economics met with little favor; until the end of the nineteenth century general treatises have well nigh invariably included both fields. Since then, however, it has become common in the United States to divide textbooks into two parts with headings something like "economic principles" and "economic problems," the first including a discussion of value and distribution and the latter being devoted to such topics as money and banking, labor problems, transportation and the like.

The content of what at the present time constitutes economic principles is indicative of the development through which the systematization of economic theory passed in the course of a century. In 1811 D. Boileau (*Introduction to the Study of Political Economy*), basing himself partly on Jakob, divided the subject into the increase, the distribution and the consumption of wealth. In 1821 James Mill, the great systematizer of the classical school, divided theory into parts dealing with the production, the distribution, the interchange and the consumption of wealth. With the substitution of exchange or circulation for interchange this division remained typical for a long time. With the acceptance of the marginal utility approach the topic of value, originally treated under exchange, was given more prominence; the more practical topics originally found under exchange, such as money and credit, transportation and the like, were either constituted into semi-independent disciplines or relegated to a separate part; production was identified with the supply determinant of value and consumption with its demand aspect. As a result theory proper was reduced to a closely integrated analysis of the principles of value and distribution. Where the old fourfold division was kept, another part, the treatment of the economic system as a whole,

was usually added to it; this is concerned primarily with dynamics, or the study of economic cycles.

The differentiation of economics into separate teaching disciplines has been almost inevitable because of the complexity of the subject. Since fiscal problems are so largely distinct from general economic problems, it is only natural that fiscal science, or public finance, should have been erected at an early period into a separate subject. As early as 1729 Dithmar distinguished economics, which deals with the securing of industry, food and wealth, from cameral science, a study of the revenues and expenditures of the prince, and from the science of police concerned with the numbers, morals and prosperity of the people. In the course of time police and cameral science coalesced to form the science of finance, or fiscal science. Later other disciplines acquired separate existence: agricultural economics, business economics, money and banking, international trade, transportation, are all taught separately, have given rise to special research techniques and have developed an extensive literature of their own. Their dependence upon and interrelations with general theory are, however, much closer than in the case of fiscal science.

EDWIN R. A. SELIGMAN

HISTORY OF ECONOMIC THOUGHT. Introduction. The economic thought of early civilizations is reflected principally in the legal codes and in the religious writings. It was not until the beginnings of political and social science among the Greeks that an attempt was made to analyze economic phenomena. But even by the Greeks wealth was treated largely from the moral point of view and economic discussion was subordinated to political considerations. Among the more than one hundred and fifty works on economics which, according to J. Camerarius (*De re rustica*, 1577), were written by the Greeks only a few have survived. Xenophon devoted most of his work on *Oeconomike* to domestic economy. He defined wealth as the surplus of possessions over wants, emphasized the idea of utility, stressed the advantages of division of labor, regarded agriculture as the mother and nurse of all the arts and declared handicrafts objectionable as weakening the body and interfering with the leisure of the citizen. In another work he propounded the maxims of just taxation and discussed the influence of demand and supply, the relation between the quantity and the value of money and the law of diminishing returns. Plato divided

commodities into productive and acquisitive, analyzed the benefits of exchange and pointed out the function of money in uniting incommensurable goods. Even in Aristotle the economic discussion is incidental, yet he is responsible for some of the most fertile ideas of later discussion, such as the distinction between utility and value; the definition of wealth as goods capable of accumulation, possessing utility and limited in quantity; and a clear exposition of the function of money.

In Rome systematic discussion was virtually limited to the treatises on agronomy. Cato, Varro, Columella and Palladius, basing their work on that of Mago the Carthaginian, discoursed on the relative advantages of large and small farms, on the drawbacks of absenteeism and on the economic shortcomings of slavery.

The advent of Christianity with its insistence on individual salvation exerted a potent influence on the current attitude to charity, poor relief, the dignity of labor, the position of women, the treatment of slavery and the limits of private property. But the chief economic discussion of the church fathers, as in Augustine, Tertullian and Jerome, related to the legitimacy of trade and the criticism of the profit motive. With the rise of commerce and industry in the twelfth century it became necessary to deal more fully with business conditions. The theologians, the canonists and the legists became therefore increasingly engaged in discussing the problems of usury, fair price, money and banking, interlocal finance and public credit. Along with this went incidental analyses of the influence of cost of production on value and of demand and supply on price, of the relation of individual to social utility, of the nature of interest and the growing evasions of the usury prohibition, of the attributes of money and the formulation of Gresham's law, of the limitation of credit and of the principles of taxation. But the main emphasis continued to be put on the ethical significance of the economic action of the individual, whether subject or prince.

With the beginning of capitalism in the sixteenth century attention was shifted from the individual to the community and the questions of group welfare were pushed into the foreground. The opening up of the through sea route to the East, the discovery of America, the revolution of prices, the growth of wholesale trade and the infiltration of capital into industry were responsible for the disappearance of feudalism, the passing of the village economy, the decay of the

guilds, the consolidation of peoples and the concept of national wealth. The humanists, the reformers, the radicals and the utopians began to consider existing problems in a new light. Hales, Bodin and Davanzati attacked economic questions in a non-mediaeval way and the bullionists, particularly Malynes and Milles, frankly raised the question of national prosperity.

The concept of national wealth as affected by state control was stressed by the mercantilists. Their leading objectives were an increase of population, the protection of agriculture and industry, the economy of low wages, a favorable balance of trade, the development of a colonial system, the accumulation of capital with a resulting low rate of interest and a reform of the revenue system. In the following century the increasing importance of capital in industry and the growth of the foreign market engendered a closer analysis of national wealth and the formulation of general principles, the philosophical basis of which had already been laid by Pufendorf and further developed by Hutcheson and Christian Wolff. When the next stage of capitalism was reached by the advent of *la grande industrie* in France and the triumph of the domestic system in England, a closer study of capital and its various modes of employment led to the formulation of universal economic laws by the physiocrats and Adam Smith.

From this point on the movement of economic thought is best traced by following the succession of schools. It is not to be inferred that all writers on economics can be easily classified by schools, that the various schools exhibit an equal degree of cohesion or that there has been a clear succession of schools for the discipline as a whole. Nevertheless, an exposition of the theories of the various schools, an account of the leading factors in their development and a statement of their residual contribution to science is the only possible way of presenting the history of a subject in which the interest and *Weltanschauung* of the student count for so much in the final result. The first and probably the only school in the true sense of the term was that of the physiocrats, but it dominated economic thought only for a short period and its influence was almost entirely limited to France. The classical school which followed it has left an impress on the science clearly discernible to this date; it had an enormous vogue in England, on the continent and in the United States, and for nearly a century economics was virtually identical with its doctrines. In influence only the later school of

marginal utility is at all to be compared with it. At the present time marginalism together with its variant known as mathematical economics has probably the largest following among economists. Apart from the two central schools, between which the neoclassical school occupies an intermediate position, there must be mentioned the varieties of dissidence from abstract economic theory. Of these the best known are the historical school, whose influence has been strongest in Germany, and the institutional school, whose following is even at present virtually limited to American economists. Socialist economics represents a reinterpretation of classical doctrines in terms of a social philosophy which emphasizes the historical character and the class structure of the capitalist society. Socio-ethical dissent from the teachings of the "dismal science" paralleled the development of the latter almost from the beginning, but its theory was never elaborated in great detail or well organized about a single unifying principle. Finally, the present day German school of universalist economics, the achievements of which have really been sociological rather than economic in the narrowest sense, embodies dissent from the main classical-marginalist tendency by emphasizing the aspect of the whole, the organic and spiritual rather than the mechanical and materialistic nexus between men in society.

EDWIN R. A. SELIGMAN

The Physiocrats. In the middle of the eighteenth century France was still primarily agricultural. It possessed the largest area of naturally fertile land to be found in western and central Europe and its richest inhabitants were generally those who owned landed estates. The preeminence of agriculture as a form of labor and of wealth was there still taken for granted. If the first scientific doctrine of economics was to be formulated in France, it was natural to base it upon the principle of the primacy of agriculture. Important contributory circumstances were that throughout the first third of the century industry and commerce had remained stationary and that in the same year in which the founder of the school published his first economic work the Seven Years' War broke out, cutting France's foreign trade in half, ruining its merchant marine and compromising its colonial future but leaving its fields and pastures intact.

At this date the example of the other great western power, England, could not appreciably weaken the validity of the French traditional

viewpoint which in the past had been shared by most of the great states: it was easy to regard English agriculture, the most efficient and the most prosperous in Europe, as one of the principal foundations of British prosperity. The tradition of agricultural primacy was even less contestable in application to the English colonies which were growing up in North America. Holland, on the contrary, was declining; its greatness had been founded merely upon the ruin of Antwerp, and the development of its rural economy had simply kept pace with that of its commerce. As for Spain, it could be argued that it lost the rank of a great power because it attempted to develop its marine at the expense of its agriculture.

Quesnay was not unaware that France had become, in his own words, *un pays de fortune*, and the role that money played there could not have escaped his attention. What he and his followers called for was that the better part of this liquid capital should be devoted to agriculture in such a way as to increase its yield, an increase particularly necessary for the relief of the growing fiscal distress; for the notion that the tax on land constituted the least contestable and the surest source of revenue of the royal fisc was also current in France at the time.

On the other hand, the regime of regulation, protection and prohibition in the administration of industry and commerce had steadily lost favor; liberal tendencies, represented notably by d'Argenson and Gournay, had gradually come to the fore. If economic freedom appears in the physiocratic doctrine as a secondary rather than a primary principle, this "preestablished harmony" of the theories with the general tendencies of the period undoubtedly fortified the belief in their validity at the same time that it more or less consciously inspired their formulation. The revival of the spirit of liberty, in this as in other fields, in opposition to the authoritarian traditions of the preceding age was but a manifestation of the critical spirit that had been gathering force since the beginning of the century.

Yet even while it profited by the heritage of critique and analysis bequeathed by the preceding epoch, the physiocratic system represented a return to synthesis and as such was clearly positive and constructive. Montesquieu's *L'esprit des lois* (1748) marked a transition in this respect. The new doctrine was closely related to the great intellectual enterprise of the period, the *Encyclopédie*, and to the work of such men as J. J. Rousseau and Buffon. Similarly, it may be re-

garded as a revival of one of the most characteristic traits of the French genius following a period when Anglomania had reigned supreme in all fields.

Indeed, the *économistes* used and abused Cartesian evidence and the rigor of mathematics, and in their writings the geometric mode of reasoning sometimes impaired its finesse. Disdainful of history and even of a patient study of the contemporary world, they too easily believed that they had ascertained a priori absolute laws, to which they ascribed a universality of application matched only by the simplicity of the underlying principles. And if to one of them credit is due for coining the phrase "moral and political sciences," they did not suspect that those new sciences were to resemble the natural sciences and were, like the latter, to proceed more by induction than by deduction.

The originality of their social philosophy, upon which their economic doctrine implicitly rested, consisted in placing above everything else private property, especially property in land. Property in movable goods approached the same status, because the cultivation of land would yield only insignificant returns were it not accompanied by the assurance of a free disposal of the produce as well as of the necessary working capital. A similar status was attributed to property in one's own person, so that everyone could freely place his services at the disposal of the landed proprietors.

The various liberties which they advocated are really mere corollaries of the right of private property. Thus free trade is primarily unquestioned freedom of the agriculturist to produce whatever he pleases and to dispose of his product without any restrictions. Not even political frontiers should prove an obstacle, for the inalienable rights of the producer-seller par excellence have precedence over international conventions; absolute individualism leads logically to frank cosmopolitanism. Inequality inherent in liberal societies is also the logical consequence of private property as well as one of the prerequisites for its productive utilization: the labor of the poor is no less useful than the money of the rich for the advantageous exploitation of the soil. Society is governed by private self-interest, which is the "born servant of the general interest." Free competition, "the mainspring of human perfectibility," brings about the reign of justice, a legal equality among individuals which may and even should in the general interest allow for the existence of great factual inequalities.

Ex natura jus—such is the great mystery of physiocracy, the government of nature.

Political organization as envisaged by the physiocrats is simply to be modeled after the economic and social. Any government is good if it respects private property and the liberties bound up with it. The best government would doubtless be that of a monarch whose title is hereditary like that of every landed proprietor, and who would enjoy a sort of universal but strictly defined property right in the lands of his kingdom, coexisting with the right of the private proprietors. The monarch would be preserved from every excess of absolutism by the constant surveillance of a free and enlightened public opinion and by the very consciousness of his own interest. The body politic would naturally comprise as full fledged citizens only the possessors of landed property and the large scale farmers who direct its cultivation.

In the elaboration of their doctrinal system the physiocrats start with the axiom that agriculture alone is truly productive. This means not only that agriculture furnishes the raw materials and provisions which are essential for industry and trade and in the last resort for the survival of mankind. Much more important is the fact that it yields in addition to the subsistence of its laborers and the remuneration of its entrepreneurs, whether independent farmers or *métayers*, a surplus profit for the owner of the land (Cantillon's "third rent"), a part of which could be appropriated by the state without hindering the success of the agricultural enterprise. Trade and industry appeared sterile because the physiocrats could not discover that they yielded a regular surplus profit similar to the agricultural net product. Indeed, at the time there was no group in commercial or industrial pursuits which occupied the same privileged position as the landed proprietors in the field of agriculture.

The productivity of agriculture is conditioned upon capital advances of various types. The *avances annuelles* for seed and expenses of cultivation are indispensable. If they are not merely to reproduce themselves but are to be at least doubled, it is necessary that in addition to the *avances foncières*, such as land clearing and buildings, furnished by the proprietor at the inception of the agricultural enterprise, the *avances primitives*, livestock and agricultural implements, should be of considerable magnitude, indeed should almost equal in value the land itself. It is important therefore not only to encourage the development of a class of rich agricultural entre-

preneurs or large scale farmers who would lease large areas of land for long terms but also to facilitate a general flow of capital to agriculture. Although the landed nobility could provide a part of the capital, it is particularly important to seek the aid of moneyed capital and therefore guard against its investment in the endless series of government loans at high interest, in useless and onerous commercial enterprises, such as a great number of retail establishments, or in risky ventures, such as overseas shipping.

In order to make possible the large scale agriculture extolled by the physiocrats it was necessary to dispose of the commons by alienating it as a single parcel or in large lots; to abolish feudal servitudes like *vaine pâture* and *parcours* which proved obstacles to progressive methods of cultivation; to do away with hunting privileges, a veritable legalized devastation; and to provide appropriate remedies for the plague of vagabondage. The large scale farmer too must be secure in the management of his property against all administrative interference, freed of the corvée on the roads and of service in the militia and guaranteed against such taxes as the inequitable *dîme* or the arbitrary and disastrous personal *taille*. The transfer of every land tax from the farmer to the proprietor would be the best solution if such taxes were assessed on a percentage basis on the net rent accruing from the lease of the land.

Yet the entire edifice of agricultural prosperity rests in the last analysis on the "good price" (*le bon prix*). The price of grains and other agricultural produce must be considerably in excess of their cost of production. Therefore domestic consumption by both the rich and the poor must be stimulated; tolls and local prohibitions on traffic in agricultural commodities must be abolished; an equalization of market prices between provinces and from year to year, which is advantageous to the producers and detrimental solely to middlemen, must be insured by free competition; monopolies enjoyed by retail dealers and especially by the large government contractors, as well as the traditional regulation of markets whose only aim is to degrade the country produce to the sole profit of the urban merchants and manufacturers, are to be suppressed; finally commercial routes are to be improved and the number of canals increased. The export of agricultural commodities should at all times be perfectly free; even if the quantity exported is very small the domestic producers will benefit by the opportunity to sell at the price prevailing in

the world market, which, it should be noted, happened to be at that time high enough to assure a fair return. Certainly after a succession of good harvests, such as occurred in 1763 and 1764, export outlets must be thrown wide open in order to avoid a crisis. Everything that may raise the prices of industrial products and thus increase the expenses of agricultural production must be avoided. Therefore there should be no attempt to impose taxes on industrial enterprises or products; such taxation would prove illusory and onerous, for the burden, heavier than ever, would in the last resort be shifted to the primary producer, the agriculturist. Finally, no unfair protection against the legitimate competition of foreign producers must be allowed to industry and active competition must be fostered among the domestic manufacturers, in order that the prices of industrial products be forced down to the fairest level.

The legacy bequeathed by the physiocratic school to posterity was a new science of economics, emancipated from politics and destined as much as the latter to inspire henceforth the researches of historians and the policies of statesmen. When the physiocrats turned their attention from the phenomena of commerce which preoccupied the bullionists and mercantilists to the initial problem, the analysis of production, they transformed the study of wealth into a science. But the analysis could not be based on the largely subjective notion of use value, because it was not tangible and simple enough for a discipline in its infancy. A solid foundation could at the time be provided only by the conception of exchange value from which all psychological elements explaining the preferences governing individual exchanges had been eliminated. It retained only the element of social value, which in a given market offers a common measure for all purchases and sales. The neomercantilists and the populationists, who focused their attention on industry, regarded labor as forming the major share of the substance of this objective and intrinsic value. The physiocrats succeeded in grasping the decisive role of capital, because they were concerned primarily with agriculture where that essential factor of modern production appeared very distinctly in the form of improvements on land, livestock and agricultural implements. Because of an exaggeration reversing that of their forerunners they erred in failing to appreciate the value of human labor; and an excess of logic resting on a half truth led them to a stillborn paradox of the ste-

rility of industry and trade. But it must be remembered that if the apologists of manufacture and commerce are correct in exposing the erroneousness of physiocratic axioms and the socialist theorists the inhumanity of their corollaries, it still remains true that both Adam Smith and a century later Karl Marx belong among the intellectual offspring of physiocracy.

G. WEULERSSE

The Classical School is that orientation of English economic thought which began with Adam Smith's *Inquiry into the Nature and Causes of the Wealth of Nations* (1776) and which numbers among its major representatives Smith, Ricardo, Malthus, James Mill, John Stuart Mill and Cairnes, whose *The Character and Logical Method of Political Economy* (1857) marks the close of the classical epoch. In the same group must be included the French economist Jean Baptiste Say, author of *Traité d'économie politique, ou simple exposition de la manière dont se forment, se distribuent et se consomment les richesses* (1803), who not only popularized and commented upon the English classics but also made original contributions. Although the chief writers in the classical tradition were English, the school was by no means limited to England; in the first half of the nineteenth century it dominated economic thought in all civilized countries. It still exercises a considerable influence upon economic science; while its doctrines and methods have often been disputed, rejected or modified, its formulation of problems is still so significant that present day economists must begin where the classical school left off or refute the classical statement of the subject.

The classical economists did not constitute a school in the sense of "an alliance of persons, a community of ideas, an acknowledged authority and a combination in purpose" (Higgs, Henry, *The Physiocrats*, London 1897, p. 3). Although they had in common a number of fundamental ideas, there was no single leader among them to whose authority they all paid unqualified homage nor did they profess a unity of purpose except that implicit in a search for the fundamental principles which are manifest in economic life. Smith is considered the founder of the school because he was the first to envisage the economic world in its entirety and to set forth the uniformities and sequences obtaining in it. But Smith was a man of essentially realistic talents, and the chief significance of his work lies not so much in the purely theoretical doctrines

which he developed as in the systematization and attractive presentation of a great mass of empirical material. It was Ricardo who more than anyone else left the stamp of his intellectual personality upon the body of classical theory. Because of his great acumen and intellectual grasp of the whole range of economic doctrine he cast the formulation of a great many problems into a mold which was rarely abandoned by classical writers. Yet not even in his own day was his authority unquestioned. Many of his important contentions were disputed, these controversies becoming embodied in a most interesting and illuminating literature of pamphlets and personal correspondence. Perhaps his most formidable opponent was Malthus, a person of a realistic bent of mind and therefore fundamentally at variance with Ricardo's abstractness; of Malthus' contributions, however, little has survived except the doctrine of population, which became an integral part of classical theory. The Mills made explicit the Benthamite substructure of a great deal of economic theorizing and John Stuart Mill is responsible for the final synthesis of all essential contributions to classical theory from the time of Smith to his own day.

The most general of the conceptions underlying the theories of all classical economists are the postulates that liberty and property are the keystones of every rational economic order and the claim that political economy resembles a natural science in the universal applicability of its laws. In this, classical economics is scarcely different from physiocratic theory, which preceded it, but the sources from which these ideas derived were not the same. Smith was under the influence of the physiocrats; like them he held that the economic life of society rests upon certain natural principles of which the most important is that economic freedom may be expected to yield greater and more beneficial returns to society than any form of government intervention in economic affairs. But for his social philosophy, explicitly stated in *The Theory of Moral Sentiments* (1759) and in his *Lectures on Justice, Police, Revenue and Arms* (edited from notes taken by a student in 1763, Oxford 1896), he was more indebted to a succession of English and Scottish moral philosophers—Locke, Shaftesbury, Ferguson and above all his teacher Hutcheson. They inspired his faith in a divinely ordained harmony of egoistic and altruistic impulses in man. In accord with them he believed that self-love will always find itself circumscribed by love for one's fellows and urged that

the individual should strain every nerve and muscle to outrun his rival for external advantage but should never check or hinder that rival by unfair means.

Ricardo and the post-Ricardian economists borrowed their social philosophy from Bentham, for whom the greatest happiness of the greatest number was the true goal of every government. From the psychological fact that every individual is most intent upon his own advantage Bentham inferred that the legislator should further this striving to the utmost. He held that there is no conflict between one's own advantage and the welfare of others, because every man feels that the best security for his own happiness consists in having regard for the happiness of his neighbor. The task of statesmen and moralists is to spread a knowledge of true morals; that is, a conception of wisely circumscribed self-interest which will promote the common weal at the same time that it furthers private interest. Since everyone knows best what profits him most the lawgiver should leave individuals as free and unhampered as possible.

Although this individualistic and liberal social philosophy permeated the economic writings of the classicists it was never expounded in them at great length. For this reason the classical school was accused of neglecting ethical considerations and of exalting material individual advantage to the ruling principle of economic science. These critics overlooked the fact that the classicists shared with their contemporaries a number of assumptions about human nature and the best or most natural social order. In the light of these assumptions it becomes clear that the promotion of self-interest and a regime of unlimited competition were regarded by the classicists not as ends in themselves but as instrumentalities for maximizing social welfare.

Equally unjustified were the criticisms directed against the allegedly unhistorical character of classical doctrines, the universal validity which was claimed for the precepts of the classicists. In the course of his inaugural lecture at the University of Vienna in 1888 Brentano made the following statement: "Classical economics has created a man free from all the peculiarities of occupation, class, nation and cultural-historical stage. It makes no distinction between peasant and merchant, between the instincts of the uneducated laborer and those of the cultivated intellectual, not to speak of its overlooking the great differences within the working classes. It knows no difference of race, religion or epoch"

(reprinted in his collection, *Der wirtschaftende Mensch in der Geschichte*, Leipsic 1923, p. 3). This description applies neither to Smith nor to Ricardo nor indeed to any of their more important followers. It is inconceivable that men like Smith, who broadened his experience by travel and close associations with men of affairs, or Ricardo, a London stockbroker by profession, were so innocent of all knowledge of the world and of life. This criticism is based on a misunderstanding of the methodology of classical economics and reveals a failure to distinguish clearly two different approaches found in the writings of the classicists. They were well aware of the influence of forces other than self-interest—ethical, social, national, religious—upon economic life; but they deliberately followed the method of isolating abstraction and set out to formulate doctrines which would apply in a situation where men are guided solely by self-interest, the most important driving force in a capitalistic economy. The phenomena traceable to drives other than self-interest were also taken account of but as temporary deviations from the "natural" or posited state of affairs, as modifications or disturbing accompaniments, which do not affect the truth of the fundamental laws. Thus Ricardo often speaks of the "permanent state of things" as distinguished from the "immediate and temporary effect" and finds that "temporary causes" do not touch the principle but only "disturb it in its progress." Similarly John Stuart Mill contrasts the "truths of the pure science" with the "practical modifications" and denotes as "disturbing causes" the circumstances by which the "fundamental laws" of economics are modified.

The classical writers were well aware of the differences between their abstractly deduced laws and the whole of economic reality. But in their time conditions were simpler and economic processes fitted more readily into the rigid molds of deductive generalizations; inferences resting on the assumptions of the economic man and of the economic principle were then closer to reality than they would be at present. In defending Ricardo against adverse criticism Cairnes made a penetrating observation: "In employing the method of reasoning on hypothetical cases, Ricardo, in effect, employed, as far as the nature of his problem and the circumstances of the case permitted, that experimental method which those who would disparage his great achievements affect to extol, but the real nature of which, as their criticisms show, they so little

understand" (*The Character and Logical Method* . . . , 2nd ed., p. 93).

The common fund of the more purely economic doctrines of the classical school may be described very briefly. Unlike the physiocrats, who stressed the primacy of agriculture and of the landed gentry, the classical economists made labor in general the alpha and omega of their speculations. Thus Smith begins his treatise with the proposition that "the annual labour of every nation is the fund which originally supplies it with all the necessaries and conveniences of life which it annually consumes." It follows that the topics really worthy of consideration are the factors conditioning the productivity of labor; hence Smith's emphasis on the division of labor, which is declared to have been responsible for "the greatest improvement in the productive powers of labour and the greater part of the skill, dexterity, and judgment with which it is anywhere directed or applied . . ." (bk. i, ch. i). Division of labor gives rise to exchange and with it to the problem of value. Despite important disagreements on the subject all classical economists held fast to an objective conception of value, the ultimate source and common measure of which they saw either in labor or in cost of production. In a characteristic fashion the processes of the distribution of wealth were brought into direct relation to the processes of production, and by a theory of imputation income shares were related directly to factors of production.

There is less agreement among the classical writers on specific doctrines, even on such important theories as those of value and rent. Yet it would be safe to assume that the doctrines of Ricardo would be considered in virtually every case as representative of the classical tradition. Thus Ricardo may be regarded as the real originator of the labor theory of value, which is in a sense the foundation of the entire body of classical theory. Smith taught that "the real price of everything, what everything really costs to the man who wants to acquire it, is the toil and trouble of acquiring it" (bk. i, ch. v) but that, on the other hand, "the value of any commodity . . . to the person who possesses it, and who means . . . to exchange it for other commodities, is equal to the quantity of labour which it enables him to purchase or command" (bk. i, ch. v). Smith thus fluctuates between the labor-cost and labor-command theories of value. Ricardo objected to the latter and set forth in the first chapter of his *Principles of Political Economy and*

Taxation (1817) the proposition that the exchange relations of all goods "which can be increased in quantity by the exertion of human industry and on the production of which competition operates without restraint" are regulated in the long run by the amount of labor expended in producing them. Yet Ricardo is not a consistent supporter of the labor theory of value. In his *Principles* he introduced an essential modification by maintaining that, since the amounts of fixed and circulating capital employed in different enterprises and the duration of the production process vary, the rate of profit also plays a part in the determination of value. In his correspondence the original doctrine of value was modified even more extensively, until in a letter to McCulloch dated June 13, 1820, he wrote: "I sometimes think that if I were to write the chapter on value again which is in my book, I should acknowledge that the relative value of commodities was regulated by two causes instead of by one, namely, by the relative quantity of labour necessary to produce the commodities in question, and by the rate of profit for the time that the capital remained dormant and until the commodities were brought to market" (*Letters of David Ricardo to John Ramsay McCulloch, 1816-1823*, ed. by J. H. Hollander, New York 1895, p. 71). It is to be noted also that Ricardo was concerned not with real value but with relative value, i.e. the relation between the values of two commodities or between the values of the same commodity at different periods of time. For this reason he could pass the problem of reducing labor of different skill or intensity to a common standard by remarking that the relation between different types of labor "has long ago been adjusted" and is not subject to much variation. In a sense therefore Ricardo is nearer to a cost of production explanation of value which post-Ricardian classicists such as John Stuart Mill supported than to a strict labor theory of the type later developed by Karl Marx.

The wage theories of the classical economists show a tendency to become increasingly rigid, to narrow more and more the range within which wages may fluctuate. By referring back to "that original state of things, which precedes both the appropriation of land and the accumulation of stock," Smith concluded that wages are regulated by the deductions made from the full product of labor for rent and "profit"; these deductions are determined by the comparative bargaining power of the parties concerned. But ordinary wages have a minimum in the amount

necessary to maintain the laborer and to rear a family of such numbers as will in the long run provide a sufficient supply of labor to satisfy the demand for it. Moreover "the demand for those who live by wages . . . necessarily increases with the increase of revenue and stock of every country, and cannot possibly increase without it" (bk. i, ch. viii). But just as "the liberal reward of labour . . . is the effect of increasing wealth, so it is the cause of increasing population." Basing himself on these rather confused statements of Smith and making use of Malthus' doctrine of population propounded in the meantime Ricardo developed a theory called later "the iron law of wages." He maintained that "the natural price of labour is that price which is necessary to enable the labourers, one with another, to subsist and to perpetuate their race without either increase or diminution" (ch. v). The market price of labor, determined by the demand for it (i.e. the amount of capital) and the supply of it, must in the long run conform to the natural rate. The reason for it is that since the tendency of population to propagate is virtually unlimited and is always greater than the possibility of increasing the food supply, an excess of the market rate over the natural rate will result in such an increase in the supply of labor as will wipe out this excess and will by reaction depress the market rate below the natural rate. When the latter situation obtains, the privations of the laborers will reduce their numbers. It may be noted that the Malthusian doctrine of population has no necessary logical connection with a wage theory such as Ricardo's: there may be other reasons why wages tend to be depressed to the subsistence minimum, nor is it clear why the tendency of population to unlimited propagation should display itself most forcefully among the laboring classes. Indeed, Malthus himself dissented from Ricardo's theory of wages.

Yet Ricardo's theory was not completely rigid. He maintained that the natural price of labor estimated in food and necessities is not absolutely fixed and constant but depends essentially on the habits and customs of the people. He wrote further that "the friends of humanity cannot but wish that in all countries the labouring classes should have a taste for comfort and enjoyments, and that they should be stimulated by all legal means in their exertions to procure them" (ch. v). Moreover, he believed that by developing "prudential habits" workmen may succeed in raising the level of wages. A more rigid theory is that of the wages fund, which is

implicit in Smith and even more clearly suggested by Ricardo; it was first explicitly formulated by James Mill (*Elements of Political Economy*, 1821). According to this theory wages are determined by that part of the capital fund which is set aside for the payment of wages, this wages fund being fixed for each production period. It was on the basis of this theory that classical economists, including John Stuart Mill, took a position hostile to organized labor: trade unions could achieve higher wages for their membership only at the expense of the unorganized labor groups. Workers could hope for an improvement in their lot only if they reduced their numbers by refraining from the rearing of families or if the wages fund were increased. Later, under pressure from Longe and Thornton, J. S. Mill materially modified his views and finally gave up the theory altogether, but his disciple Cairnes, the last stalwart of classical economics, still held fast to it.

The most important and enduring of the specific achievements of the classical school is the Ricardian rent theory, which was anticipated in part in James Anderson's eighteenth century writings and which was stated simultaneously with Ricardo by West in *An Essay on the Application of Capital to Land* (1815) and by Malthus in his *Inquiry into the Nature and Progress of Rent* (1815). In opposition to the physiocratic conception, which was shared by Smith, that rent represents a surplus product of the soil due to its fertility, Ricardo pointed out that, on the contrary, when the soil is very fertile no rent ensues. Rent first makes its appearance when with the increasing settlement of a country less fertile soils which have to be worked with higher costs of production are brought under cultivation in competition with the most fertile soils first tilled. The differences between the production costs on the less fertile soils and those on the soil of maximum fertility give rise to a differential income for the owners of the more fertile soils, or to differential rent. Ricardo also envisaged the formation of absolute rent, when all available land is brought under cultivation and an absolute scarcity of land ensues (ch. xxiv); but he maintained that absolute rent is governed by the same principle as differential rent, that is, it is a price determined rather than a price determining factor.

The theory of differential rent is intimately bound up with the law of diminishing returns of land. The reason why farmers are forced to have recourse to less fertile soils is that the employ-

ment of additional capital and labor on the more fertile soils first cultivated would yield progressively diminishing returns. This law was first clearly recognized and stated by Turgot in 1768 and was later given an exact formulation by Senior.

The observations of the founders of classical economics regarding interest and profits are unsatisfactory. Smith had no developed theory of interest and Ricardo had from the very outset placed the whole problem on very shaky ground by treating interest and profit together under the name profit. Ricardo sheds virtually no light on the conditions which give rise to interest. In discussing the difference in the values of commodities whose production requires capital investments for periods of different length he remarks: "The difference in value arises in both cases from the profits being accumulated as capital, and is only a just compensation for the time that the profits were withheld" (ch. i). In his chapter "On Profits" he observes that "no one accumulated but with a view to make his accumulation productive, and it is only when so employed that it operates on profits. Without a motive there could be no accumulation. . . . The farmer and manufacturer can no more live without profit than the labourer without wages." More important is his theory of the average rate of profit. He maintained that in view of the mobility of capital the rates of profit in different employments must in the long run gravitate to an average level. While with Ricardo this theory is only one of the many consequences of the leveling effect of competition, Karl Marx found in it the binding link and the capstone of his theories of value and of surplus value.

Important contributions to the theory of interest were made by classical economists other than Smith and Ricardo. Especially significant for the later development was Jean Baptiste Say's theory of productive services applied equally to labor, capital and land; interest was by this theory explained as due to the productivity of capital. In a form considerably modified from its original naïve statement this doctrine was later incorporated into the productivity theory of interest which is still current. Senior explained interest as the compensation for the pain and trouble of the saver's abstinence. As compensation for waiting (Marshall) or as the greater value of present goods as compared with future, Senior's abstinence still figures in modern interest theories as one of the supply factors of capital.

On profits proper the contribution of classical economists is limited to the theory of the wages of management. Passages suggesting this explanation of profit may be found in the *Wealth of Nations*, but it was more explicitly stated by James Mill and McCulloch. In his *Principles* John Stuart Mill distinguished three component parts of profit: interest explained by abstinence, compensation for exposing capital to risk and the wages of superintendence.

The theory of international trade as developed by the classical school is the best evidence of the fact that the classical economists were ready on occasion to take account of important deviations from rational economic behavior. This theory is a modification of the doctrine of domestic exchanges made necessary by the fact that the international mobility of capital is imperfect. The reasons for it are, as stated by Ricardo, the fancied or real insecurity of capital when not under the immediate control of its owner and the natural disinclination of every man to shift his residence to a country with foreign customs and laws, a feeling which Ricardo "should be sorry to see weakened." Since the international migration of capital does not eliminate inequalities between countries arising from the unequal distribution of natural advantages and the specialization resulting therefrom, the cost of production of the same commodity may vary from country to country. In international trade price cannot therefore be determined by the absolute cost of production. It is regulated by the comparative costs in the two or more countries involved. This doctrine of comparative cost was first formulated by Ricardo, its former attribution to Torrens not being accepted by modern scholarship; it was further developed by J. S. Mill, who added demand as a factor in the determination of international values. He stated the law thus: "The produce of a country exchanges for the produce of other countries, at such values as are required in order that the whole of her exports may exactly pay for the whole of her imports." He declared that "this law . . . is but an extension of the general law of Value which we called the Equation of Supply and Demand" (bk. iii, ch. xviii, sect. 5).

The classical economists made many more specific contributions to theory—Ricardo developed a refined quantity theory of money, Say propounded a theory of markets and defended it against Malthus who believed in the possibility of general overproduction, and all the classical writers devoted considerable attention to taxa-

tion, particularly its shifting and incidence. But these doctrines are not as closely integrated with the general body of classical theory as those described above; they must be regarded as the contributions of individual economists rather than as the heritage of a school.

The economic policy of the classical school, its insistence upon economic freedom, which took such forms as the advocacy of international free trade, of the sweeping away of the survivals of the feudal and guild systems, of the prohibition of combinations among the employers of labor, constitutes an essential part of its theory. The principle of free competition is at once an important corollary of the fundamental classical preconception, the belief in liberty and private property as the foundation of a rational social order, and an indispensable heuristic device in the deductive construction of a general conception of an articulated economic system. Yet it is not quite true that the classical economists advocated absolute economic freedom without any qualifications. In the theoretical part of his work Smith recommended the utmost liberty as a general maxim for the statesman, but when he comes to consider practical problems he allows for many exceptions to this principle; thus in the second half of the fourth book of the *Wealth of Nations* he lists a number of cases in which a protective duty might be necessary. Malthus, who won considerable notoriety as the man most responsible for the abolition of the system based on Elizabethan poor laws, was at the same time an advocate of agricultural protection. Ricardo likewise expressed himself in Parliament in favor of duties on wheat to save England from becoming an exclusively manufacturing nation. He supported the repeal of the law prohibiting trade union organization and pleaded for the nationalization of the Bank of England. J. S. Mill allowed for many more restrictions on the principle of free competition, urging among many other things land reform, producers' cooperation, child labor laws.

The economic policy of the classical school must be distinguished from the tendency represented by the Manchester school in England and Bastiat and liberal economics in France. The Manchester school was a radical political group which derived its name from the city of Manchester, where the Anti-Corn Law League was established in 1839. Writers of this affiliation demanded radical elimination of all government interference with economic life, denouncing not only the commercial policy of protection but

also public care of the poor, legislation for the protection of labor, compulsory education and similar measures. This school borrowed a great deal of its theoretical argumentation from the arsenal of the classical school and could cite the authority of classical economics in support of a number of its specific proposals, such as the abolition of corn laws. Yet it would be erroneous to identify Manchester with classical economics. This unfortunate association earned the classical school the ill fame of a capitalistic bias. It lent the color of verisimilitude to assertions that the postulate of economic freedom was laid down by the classical school in the interests of the rising capitalist class and that its economic laws are but an expression of class relationships in a capitalist society.

In judging the economic policy of the classicalists it must be remembered that a great many of its precepts were formulated before the development of industrialism with all its attendant evils. When Smith advocated the abolition of feudal and guild restrictions he believed that the lower classes would benefit therefrom by being allowed greater freedom of participation in economic and social progress. And the repeal in 1814 of the apprenticeship law of 1562 has actually redounded to the benefit of the working men. It is true, however, that the classical writers were too optimistic as to the possible benefits which might accrue from a greater degree of economic freedom and were not aware of the offsetting disadvantages that grew up with it.

Classical economics did not become securely established in England until the triumph of philosophical radicalism in the late 1820's. It is true that the *Wealth of Nations* was accorded an impressive reception immediately upon its appearance, was widely quoted in public debates and led to a host of commentaries as well as refutations on specific points. But with the outbreak of the French Revolution its popularity was checked; and the doctrines of the new economic liberalism came to be identified with radicalism and the French revolutionary spirit. During and immediately after the Napoleonic wars popular discussion of economic topics was revived; the difficulties facing England and the measures for their alleviation formed the subject of numerous pamphlets and tracts, some of which contributed ideas to Ricardo's *Principles*. At first this extremely compact and in places almost unreadable book was discussed and accepted only by a narrow circle. It was popularized in James Mill's *Elements of Political Economy* and by the Polit-

ical Economy Club established in 1821. The later wide acceptance of Ricardian doctrines is connected with the activity of John Stuart Mill, who published the methodological *Essays on Some Unsettled Questions of Political Economy* (1844) and four years later his *Principles*.

While the dominance of classical economics in England lasted until the late 1870's, when its hold upon the academic and popular mind was weakened by the attacks of Jevons and the rising tide of historical economics, in France it persisted in a somewhat distorted form for a much longer time. At the beginning of the nineteenth century Say effectively scotched the incubus of physiocracy and made room for the acceptance of the classical doctrines, which he systematized and enriched by original contributions. Later Guillaumin's *Collection des principaux économistes* (15 vols., 1843-48) provided a further stimulus for the acclimatization of classical theory in France. By the middle of the century, however, Bastiat produced in his *Harmonies économiques* (1850) a superficial vulgarization of classical doctrine and set going a strongly individualistic current which has since played an important part in French economic thinking and teaching. Effective dissent dates only from the 1880's with the beginning of Charles Gide's activity.

In Germany the doctrines of the classical economists, particularly Smith and Ricardo, were enthusiastically received. In a sense German economic science of the first quarter of the nineteenth century was virtually identical with classical theory. Schlözer in his *Anfangsgründe der Staatswirtschaft* (2 vols. 1805-07) adopted with some change in terminology Smith's doctrine of value and prices, and C. J. Kraus declared that Smith's conception of labor as the measure of value ranks in importance with Galileo's discovery of the measure of velocity. As late as 1843 Eiselen's *Die Lehre von der Volkswirtschaft* expounded the theory of value and prices in essentially the same way as it was taught by Smith. But German authors soon began to pay attention to demand factors and in general to the subjective elements of value and price. In his well known *Staatswirtschaftliche Untersuchungen* (1832) Hermann still followed in the main classical teaching, but he also pointed out many of its defects. The importance of psychological factors which he already emphasized was brought out more fully and forcefully by K. Thomas in his *Theorie des Verkehres* (1841) and in a masterly fashion by Gossen in 1854.

Classical economics found its rebirth in Marshallian theory, offering a synthesis of the doctrines of the classical and marginal utility schools. With the increasing popularity of neoclassical teachings, at least among the academic economists in English speaking countries, the virulence of opposition to classical economics which marked the closing years of the nineteenth century has gradually subsided. The hundred and fiftieth anniversary of the publication of the *Wealth of Nations* was celebrated in all quarters. Instead of general denunciation of Ricardo for shunting the car of economics on to wrong tracks voices are heard here and there calling back to Ricardo as the grand master of economic science.

KARL DIEHL

Marginal Utility Economics. The founders of modern utility theory are generally recognized to be W. Stanley Jevons, author of *The Theory of Political Economy* (1871), Karl Menger, author of *Grundsätze der Volkswirtschaftslehre* (1871), and Léon Walras, the first instalment of whose *Éléments d'économie politique pure* appeared in 1874. These three men, working independently and belonging to different branches of European culture, came practically at the same time to the same position. Yet the central doctrine of marginal utility, now one of the most familiar in economic theory, was not a new discovery made by them or by any other writer usually associated with the marginal utility or Austrian school. After the work of the founders received general recognition, numerous statements of similar doctrine, varying in clearness and elaboration, were found scattered through the earlier literature. Some were by men who had been recognized in their day on other grounds, others by men who had died unheard of. If the most pathetic case is that of Gossen, the strangest is that of the famous economist Senior. This thinker, characterized by brilliant insights and inability to build upon them, not only stated the utility principle but especially emphasized its main consequence, namely, that cost affects price only indirectly through supply; yet he worked out his value theory as a whole on the Ricardian principle of subjective cost, without incorporating this premise. The utility theory had apparently to wait for the "fulness of time" and to be stillborn many times before it could live.

At the present time marginal utility analysis, in one or another of its numerous variants, is firmly established in the economic thought of

all important countries. The country where utility theory first rose to dominance is Austria, hence the identification of "Austrian school" with marginal utility doctrine. The great triumvirate of Vienna, Menger, Böhm-Bawerk and Wieser, were the first to sketch in the main outlines of the new theory; they enlisted an imposing array of followers including Sax, Philipovich and Zuckerkandl, and trained a number of younger economists of whom Schumpeter and Hans Mayer are probably the best known. In Germany utility theory encountered opposition from the historical school, which was rapidly attaining prominence after the middle of the nineteenth century. Menger found himself therefore fighting the battle not merely of marginal utility but of the "exact" deductive method in social science; and allied with him was Dietzel, an economist who was nearer to the classical theory than to the Austrian school. The opposition in Germany was overcome only very slowly; not until after the war did marginal utility receive its full share of academic recognition in that country. In France the ground for utility theory was prepared by the writings of Condillac and J. B. Say. Although the mathematical performances of Walras met with disfavor, the theory was not forced to fight for survival; yet except for Walras French economics made no significant contribution to the theoretical exploitation of the utility principle. Italian economists, led by Pantaleoni and Pareto, took up particularly the mathematical variant of the new theory. Among other continental writers of the marginal utility orientation must be specifically mentioned Wicksell in Sweden, Pierson in Holland, Birk in Denmark and Bilimović in Russia.

In the English speaking countries the acceptance of marginal utility was a reaction from the theories of the classical school, which had dominated economic thought since the publication of Adam Smith's *Wealth of Nations* (1776). In England the new theory was popularized by William Smart, the translator of Wieser and Böhm-Bawerk, and P. H. Wicksteed, a follower of Jevons. Despite an obvious reverence for the classical tradition and no less pronounced coolness toward Jevons, Marshall was even more responsible for the acclimatization of a modified form of marginal analysis in England. In the United States, where classical doctrines were not as strongly entrenched, Carey's influence was on the wane when utility theory found a thoughtful and original exponent in J. B. Clark.

The other American writers with marginal utility leanings are Patten, Fetter and Irving Fisher, all of whom made original contributions on specific problems.

It has always been recognized—it could not fail to be, as soon as the phenomena came under scrutiny at all—that a thing must be desirable in order to have power to command value in exchange. But the Smith-Ricardo school considered desirability only a condition of exchange value; they rejected it as a determinant of value on the empirical ground that there seems to be the widest discrepancy in fact between the usefulness of commodities and their prices. Smith cited the example of water and diamonds, previously used by Locke and Law; Ricardo, that of gold and iron. Dismissing utility as a cause of price, they fell back upon cost, which likewise had necessarily been recognized as a factor from the beginning of speculation on the subject. Smith believed that in a primitive state commodities might be expected to exchange on the basis of labor costs, and that in a developed exchange economy the cost which determines price consists of the money payments made by producers for the labor, capital and land necessary to produce a commodity. Ricardo's highly abstract mind disliked the pluralism of Smith's treatment and his failure to integrate arguments proceeding from different standpoints. He conceived the idea that the theory of value could be made simple and unitary on the basis of labor cost alone. Several difficulties stood in the way, of which the most important were the roles of land and capital in production. The surplus theory of land rent, which had been stated by Smith, Hume and Anderson and was getting recognition through West and Malthus and according to which rent is the effect and not a cause of price, seemed to Ricardo to remove the difficulty in the matter of land and was therefore used by him as the corner stone of a new system. If Ricardo was dissatisfied with the assumption of uniform capital outlays in various branches of production, the device by which he got rid of capital as a major cause of price differences, Senior's concept of abstinence, reduced capital cost to homogeneity with labor cost in terms of subjective sacrifice. After him the formulation of value theory on the basis of sacrifice cost remained unshakable down to the "revolution" inaugurated by the marginal utility theorists. Yet the recognition of "non-competing" strata of laborers by Mill and Cairnes

made it impossible longer to take the labor cost theory literally. At the same time the classical theory of distribution, also built around the surplus theory of rent, was placing an increasing strain on every mind free from prepossession and was virtually abandoned in J. S. Mill's overhauling of the classical system. When Mill also recanted on the wages fund theory, the wreck was so complete that a new start became inevitable.

In formal statement the new doctrine of Jevons and Menger seemed revolutionary indeed. It explained price in terms of utility, summarily rejected by the writers of the old school, and squarely inverted the accepted relation between cost and price by holding cost to be derived from price and not its cause. The key to the change of view was the recognition of the homely fact that commodities are esteemed not in accordance with their significance in general, but with that of any small unit of the available supply. All the units of any commodity being alike, that unit which is employed for the most important use can be replaced by the unit in the least important employment, and an equal value must attach to both. Hence the effective use value of any good decreases rapidly as the supply increases, and the paradoxes seen by the earlier writers vanish. The use value of a unit of either water or iron is very small, because it is so abundant that it is available for trivial uses; but it would increase almost indefinitely if the supply were reduced, while gold and diamonds would be little esteemed if abundant.

This conception of the use value of the single unit of a commodity, determined by the importance of the "last" unit, or the unit in the least important use, is now generally called "marginal utility," Smart's rendering of the German *Grenznutzen* of Wieser (in his translation of Wieser's *Der natürliche Werth* in 1893). The term was not used by any of the founders of the theory. In his paper delivered before section F of the British Association in 1862 (reprinted in 4th ed. of the *Theory*, p. 303-14) Jevons called it "coefficient of utility" and in the book of 1871 "final degree of utility." Menger's term was simply "importance," that of Walras, "rarity." Jevons and Walras defined the notion with quantitative precision, using the mathematical theory of infinitesimals; Menger spoke only of units or portions as understood in everyday usage.

In attempting to explain price in terms of

marginal utility the Austrian theorists encountered considerable difficulty when they found that the utilities of articles of the same price must be very different to rich and poor buyers. The difficulty was really imaginary and was due to reasoning in terms of absolute rather than relative utilities. Jevons saw and emphasized the truth that the doctrine of utility determining price involves only comparisons by each individual buyer for himself of the different uses for his purchasing power large or small; no comparison as between one individual and another, whether of utilities or disutilities, is called for.

From explaining price on the basis of use value as in turn dependent on scarcity, it seemed a natural step to reason that where goods come into existence through production, as most of them do, the means of production, or cost goods, will be valued to the same extent as the products to which they give rise and on the same principles. Any one unit of a productive resource will be valued in accordance with the least important unit of product for which it is available, i.e. according to the satisfaction actually dependent on its use. It is due primarily to Menger that the foundation was laid for a new approach to the valuation of "indirect goods," "goods of higher order" or productive resources. Jevons had a deeper insight at some points but did not break away from the influence of the older British approach completely enough to develop his theory of supply systematically, and the later Austrian writers became confused over side issues. The values of production goods constitute at the same time the money costs of production and the incomes through which product is distributed. The fruits of the new viewpoint were ultimately greater in the field of distribution than in that of the explanation of price.

As regards price theory, critical reflection soon revealed that the revolution was by no means so great as it appeared to be from the change in form of statement. On the one hand, men found a great deal of utility theory implicit in the treatment of the classical economists; and, on the other, there was much cost theory in Jevons and Menger. Smith argued that if in a primitive community it costs twice as many days' labor to kill a beaver as to kill a deer, then one beaver will exchange for two deer. With reference to this statement two observations must be made. The first is that if the labor is not of the same kind, freely trans-

ferable from one occupation to the other, the reasoning loses all force and meaning. The second is that the reasoning is valid not only for labor but also for any other cost good, such as an acre of ground, which is freely transferable from one employment to another. If the society for any reason has its choice between definitely limited amounts of two commodities, the above reasoning will still hold without any cost being involved. The real argument, not stated by Smith but necessarily implied, is that value depends on amount produced, producers being supposed to employ the resources in the production of the more valuable product. Far from being opposed to the utility principle, the cost theory presupposes its operation at every moment of the adjustment. It is clear also that Ricardo and his successors were fully aware of the role of demand. On the other hand, both Menger and Jevons saw, the latter the more clearly, that if price depends on utility as determined by scarcity, then scarcity in turn is generally the result of the high cost of production. Jevons gave the utmost typographical prominence to the words (*Theory*, 2nd ed. p. 179):

"Cost of production determines supply;
Supply determines final degree of utility;
Final degree of utility determines value."

The essential achievement of marginal utility in price theory was that of forcing a new realistic approach to the problem as a whole, centering attention upon the behavior of actual human beings in competitive relations, each attempting to make the best of his situation in the buying-and-selling economic system. In this marginal utility theory was really following the example set by Adam Smith. Ricardian economics ran in terms of a sort of metaphysical necessity; the actual workings of competitive processes in bringing about the results contended for were assumed rather than clearly expressed, and for this reason much error as well as misplaced emphasis crept into the statements.

The greatest improvement introduced by the marginal utility viewpoint came in the field of distribution theory as a by-product of the changed view of cost. The classical Ricardo-Senior-Mill theory of distribution was utterly unrealistic. It did not consider the problem as one of the valuation of services furnished to production, under competition or monopoly, but as a matter of the successive slicing off of the social income by the three main economic classes found in the society of postfeudal Eu-

rope. Smith and Malthus, basing themselves upon an entrepreneur cost theory of price, afforded clear intimations of a realistic approach, but the building of a pain-cost theory of value around the pillar of the residual theory of rent threw all into the discard. It was the truly revolutionary contribution of the utility approach to force consideration of costs and distributive payments as integral parts of one general valuation problem, which has been gradually recognized as that of explaining economic organization under the influence of price facts and motives of individual self-interest.

In the formulation of explicit laws of price the utility theorists were no nearer the truth than the classical economists. The case of the deer and the beaver itself proves that the classicists were wrong in so far as they held that pain-cost has anything essential to do with price fixing. But prices are no more determined by psychological utilities than psychological disutilities. The essential principle is that producers choose the larger return from any productive activity irrespective of its being painful, pleasant or indifferent and that amount produced in relation to demand fixes prices. When any two commodities can be produced with the aid of the same resources of whatever sort, freely transferable from the one use to the other, the prices of those commodities must in equilibrium be such that the alternative products of the same or equal units of resources exchange for each other. Price is determined by cost rather than utility but by cost in a physical, technical sense, not that of pain or sacrifice.

Comparisons of sacrifice, however, may be and commonly are involved in greater or less degree, and the operation of the utility principle is the basis of the whole process of adjustment. This is the alternative cost theory which is definitely the product of the utility approach. But alternative cost requires much explanation and qualification to fit it accurately to the facts of economic life. The reasoning assumes that all productive resources are freely and continuously transferable from one use to another, so that, as more of one good and less of its alternative are produced, the amount of the latter given up in increasing the output of the former by one unit remains unchanged. But this condition of constant cost rarely describes the situation exactly. In general, some of the resources are freely transferable, others not; and frequently some factors are available only

in very large blocks, so that the most efficient organization requires very large scale production. The first condition will give rise to increasing cost, and the latter to decreasing cost in the earlier stages of expansion of an industry. Given an indefinitely long time for readjustment, including changes in form of capital, retraining of labor, and whatever else may be involved, the law of constant cost is not far from the truth. Under such circumstances utility determines quantities produced but cannot affect the final equilibrium price. On the other hand, the factors of production are hardly transferable instantly in any degree; for a very short period the condition approximates that of fixed supply. In so far as this is the case, price is determined by the relative utilities of the supplies as they stand, cost exerting no influence at all. Problems actually encountered fall between these two limits; the longer the period over which one looks ahead, the greater the extent to which prices at the end of it will correspond to physical cost conditions and the less the role of utility. For ordinary producers' calculations the role of cost is certainly far the greater, but the actual quoted price at any moment, the price at which consumers buy from dealers, reflects rather the demand conditions, supply being "given." The influence of relative utility as compared with that of relative cost depends on the comparative elasticities of the two curves. In the short run, supply is highly inelastic and demand conditions predominate; in the long run, supply generally has practically infinite elasticity and predominates over demand, the latter being always of intermediate elasticity.

Where increasing cost is due to the more intensive exploitation of the non-transferable factors with increasing proportions of factors drawn in from without, utility and cost work together in determining price, the relative influence of each depending on the elasticities of the two curves. Where increasing cost is due to the fact that production depends on cost goods of special qualities, the supply of which is actually an increasing function of price, the price may be said to depend on the effects of both utility and cost, the latter in the sense of disutility. In general, however, the supply of labor is little dependent on disutility considerations; nor is the supply of capital for short periods, since it is an accumulating good. Moreover, labor and capital are employed so generally over the field of production that

changes in the supply of either have to be very extensive to exert much influence on the relative supply of different commodities and hence on their prices.

The Austrians admitted the effect of cost on price through control of amount produced but held that cost is finally measured by the value of cost goods, which is derived from the value of products, and hence that utility finally controls price. The premise may be accepted as true, but the conclusion is fallacious. In so far as the costs of two commodities consist of different quantities of the same cost goods, these costs are relative physical magnitudes and are not measured by utility; this condition is much more typical for costs generally than that of distinct factors producing distinct products.

Similarly in the field of distribution the utility theorists gave the correct approach but in formulating the general principle fell into confusion. It is true that the distributive shares are simply the values of the productive services and that these are derived from product values. But in the effort to make utility the sole explanation these writers tended to argue as though different cost goods have different products or groups of products. In so far as that is true, the values of the cost goods may be said to reflect the relative utilities of the products. But the general situation is rather that ultimately all the productive resources cooperate in making each product. Hence the relative "utilities" of units of different resources depend on the relative physical quantities which they respectively contribute to each product. This sets the problem of imputation (*Zurechnung*), the division of a joint effect among co-operating causes.

Imputation was discussed by the Austrians at great length, but they reached no agreement among themselves and did not arrive at a clear and sound analysis. Here the first attempt was the best. Menger gave a fairly clear, if brief, sketch of the process of competitive imputation based on the essential fact that, while the factors almost always have to cooperate in production, any single one being practically ineffective alone, the proportions in which they are employed are variable; this makes it possible to divide the product of their joint activity among them by finding the effect of substituting a small quantity of one factor for a small quantity of another. Most of the school failed to see that the proportions are in fact variable almost without physical limit and that the pro-

ducer's problem is precisely that of deciding upon the correct proportions of factors along with the problem of fixing the output for the enterprise. The main difficulty was that economists as a class had remained ignorant of the fundamental logic of quantitative variation applicable to problems of joint causation, which had been worked out in connection with physical mechanics a century or more before. The way out was pointed especially by Marshall in England and J. B. Clark in America. The purchase of productive services by entrepreneurs follows exactly the same principles as the purchase of final products by consumers. The complementary relationship may be present or absent in either case. Buyers substitute small quantities of one productive service (or commodity) for small quantities of any other until they arrive at such proportions—varying from buyer to buyer—that they obtain from the last unit of each productive service (or commodity) equal additions to the final product (or to “total satisfaction”); competition sets all the prices in such a way as to clear the market.

The problem of interest presents a special difficulty in distribution theory, because the payment takes the form of an abstract arithmetical rate and not of a specific sum for the use of a concrete productive instrument. Ricardian economics had discussed the share of capital in the social income but had done nothing significant toward explaining the return as a rate, and the problem became a favorite one with the utility school. While Jevons made a brilliant attack on it, which was never adequately appreciated, Menger's work was very weak at this point. Böhm-Bawerk made it his main life work (*Kapital und Kapitalzins*, 2 vols., 1884–89) and under his influence and stimulation notable work has been produced in America (Fetter, Fisher and others). As Böhm-Bawerk interpreted the problem of developing a theory of interest in harmony with marginal utility principles, it involved refuting productivity and use theories as well as Senior's abstinence doctrine (which Senior unaccountably never employed to explain the rate of interest but only the role of capital in connection with the prices of goods) and explaining the phenomenon in terms of a difference in subjective appreciation of present and future goods. Some critical students think this is what Böhm-Bawerk actually achieved. Undoubtedly a more general view is that, after almost a thousand pages of prolix argumentation, he gave in a few pages a none too clear but reasonably correct

statement of the productivity theory, somewhat vitiated by the admixture of the wages fund view of the relation between capital and wages. The utility approach does not necessarily call for a psychological explanation of interest, in such terms, for instance, as the discount of future satisfactions; the simple theory that interest is a ratio between the net value product of capital goods and their money cost, as held by Wieser, would seem to be quite adequate.

It is generally claimed that the marginal utility doctrine and movement is responsible for two contributions of great scientific value. First, it focused attention on demand, which had been passed over and taken for granted by the Ricardians. In this connection the importance of its contribution cannot be overestimated. Demand has ever since been recognized as the driving power behind economic activity and economic organization, although generally physical cost relations exercise a much greater control over the superficial fact of exchange ratios. In the second place, it is claimed that utility theory carries the analysis of demand beyond the surface facts of quantity and price, that it “explains” demand. On this issue there is wide disagreement and the keenest controversy. On the one hand, some form of marginal utility theory is almost universally presented in textbooks, and it seems impossible to discuss economic behavior in a utilitarian civilization without using utility concepts. On the other hand, the theory is not merely rejected by able critics as unreal and preposterous; it is in fact a favorite point of attack for the enemies of abstract theoretical economics as such.

The issue involves all the philosophical problems connected with the concepts and methodology not merely of economics but of all the sciences dealing with man. The utility theory should be seen as the culmination, historically and logically, of the rationalistic and individualistic intellectual movement of which the competitive economic system itself is one aspect and modern science and technology are others. To its admirers it comes near to being the fulfilment of the eighteenth century craving for a principle which would do for human conduct and society what Newton's mechanics had done for the solar system. It introduces simplicity and order, even to the extent of making it possible to state the problems in the form of mathematical functions dealt with by the methods of infinitesimal calculus. Moreover, in harmony with eighteenth century crav-

ings, it claims to furnish a guide for social policy; it can be harnessed to the very practical purpose of proving that if only the state will limit itself to the negative function of defense against violence and predation and leave men free to pursue their own interests, individual self-seeking directed by market competition will bring about a simultaneous maximum of want-satisfaction for all concerned, which in this world view is the desideratum back of all thought and activity. The utility theorists were contemporary with Herbert Spencer and were philosophically his comrades in arms.

The reaction against utility theory is in part the natural reaction against the view of the world and of man which it embodies, in favor either of a more spiritual or less mechanistic view or one less apologetic and more radical; but in part also it is a reaction in precisely the opposite direction, toward more "scientific" conceptions. Under the first banner march those critics to whom the "economic man" is a caricature or a calumny or both. Some insist on treatment in terms of organic social purpose, historical forces or culture patterns. Others insist on a degree of freedom and spontaneity or of realism in detail that would exclude any treatment except the recording of events as they happen and their imaginative interpretation. Of some of these protesters it must be said briefly that they do not understand either the logic or the purpose of the utility analysis. As a matter of course, the utility description of behavior as an affair of comparing and choosing is valid only in so far as men compare and choose; no one in his senses has thought of it as the exclusive form of all activity in all historic time. More specifically, the "patterning" of interests does not invalidate the principles of utility analysis at all, so long as substitution is possible through varying proportions; and that is clearly the fact over a considerable field, whatever its precise extent may be.

In the more rigorous versions of the theory, however, there is an element of paradox and unrealism. The notion of increments of satisfaction undoubtedly implies that the value of life as a whole is some definite increasing function of the quantities of the various means of satisfactions available, which hardly agrees with common sense. It also implies the well known consumers' surplus, a quantity of free satisfaction representing the difference between what is paid for goods at the uniform market price

per unit and what an omniscient monopolist could theoretically make the consumer pay by selling to him successive small portions at the maximum price for each separately. It would be hard to locate this free satisfaction in the consciousness of a typical consumer. It is necessary at least to distinguish sharply between valuing goods as increments to a supply of goods and valuing them as increments to a total satisfaction. In fact, the entire theory is much more convincing in the loose, common sense formulation of Menger than it is in the more refined mathematical version of Jevons and Walras.

Critics of utility theory from the opposite direction contend that it is subjective and unscientific and advocate a treatment of economic phenomena by statistical methods using only physical magnitudes, quantities and prices. They deny that utility explains demand or adds anything to the demand curve or schedule taken as a fact. Logically, they can put up a strong case. The analogy of utility theory with Newtonian principles does not stand up well under examination. In mechanics, if the forces are not directly accessible, at least the conditions under which they act and the effects are measurable and do repeat themselves accurately from one case to another. In economic behavior the opposite is the case. Under no real circumstances can the behaving subject himself, not to mention any outside observer, ever know even afterward whether or not he actually performed in such a way as to realize maximum possible total satisfaction; and it is even less possible to repeat the choice experimentally with controlled variations. Indeed, on the basis of knowledge gathered from one's own experience and intercourse with others it seems that men do not balance alternatives correctly. All that can be claimed is that there is an effort to do so, with more or less approximation to this result; but the introduction of error into the reaction puts the whole relation on a categorically different basis from cause and effect in nature. On the other hand, the advocates of a purely statistical science do not seem to realize that economics, if it is to have any relation to human problems of means and ends, must be concerned with goods and services not in themselves, but as representing values or sacrifices. These cannot be treated as physical things but must be defined in the same vague and shifting terms as the human impulses, successes and failures which the scientific mind finds such unsatisfactory material.

FRANK H. KNIGHT

Mathematical Economics is a set of economic propositions and arguments presented with the aid of mathematical symbols. It may be considered a school of economic thought only in the sense that there is a division of opinion among economists as to the applicability of mathematics to economic reasoning. It is a distinction in method used rather than in subject matter and approach that differentiates mathematical economists from others, for the differences of approach among mathematical economists are almost as great as between recognized economic schools.

The most cogent reason for the use of mathematics in economic theory is that mathematics is a method of reasoning, a branch of logic. The relation of mathematics to any science which happens to employ it has been correctly described by Ludwig Wittgenstein. He states that "mathematics is a logical method. The propositions of mathematics are equations, and therefore pseudo-propositions. . . . In life it is never a mathematical proposition which we need, but we use mathematical propositions *only* in order to infer from propositions which do not belong to mathematics to others which equally do not belong to mathematics" (*Tractatus logico-philosophicus*, London 1922, p. 169). To provide a *raison d'être* for mathematical economics it would be necessary to prove that mathematical methods can be applied to economic reasoning and that their application is indispensable or at least useful. As to the former, there is no a priori reason why it should not be possible to use mathematics in the social sciences in general and in economics in particular. The inappropriateness of mathematics, if such be the case, can be established only if it is shown that the character of specific economic problems is such that there exists no adequate mathematical technique for dealing with them. The objections to mathematics in this connection are that mathematics deals with quantities which vary continuously from positive infinity to negative infinity and presupposes a "mechanical" relation between such quantities, whereas economics is not entirely limited to quantities, economic quantities are finite and discrete and the relationships among them are not "mechanical." These objections tend to identify mathematics with infinitesimal calculus and overlook the existence of such branches of mathematics as are adapted to dealing with qualities and discrete quantities; moreover, mathematics is no more to be identified with the "mechanical" than ordinary logic.

If economic theorists are interested in getting

an insight into concrete phenomena, if they start with premises bearing on economic realities and end up with conclusions relevant to the understanding of the concrete phenomena, then the specific variety of logical method used in passing from the premises to the inferences is irrelevant to the value of the conclusions. The problem that presents itself in connection with the mathematical method, so long as the question of its applicability is settled, is one of preference: is it of greater utility than other methods, and are there cases in which it is the only method possible? So far there have been found very few instances in which mathematics is absolutely necessary, but there are more examples in which the application of mathematics facilitates the prosecution of the argument. In this connection several forms of the application of mathematical methods and formulae to economic theory may be distinguished.

The simplest and least far reaching use of mathematics is the employment of mathematical symbols and graphs for purposes of exposition. It facilitates the presentation of complex and abstract conclusions; graphs particularly are found useful for didactic purposes. Although this type of mathematics is often resorted to in a subordinate capacity by many eminent mathematical economists it does not yield a genuinely mathematical economics. The mere translation of propositions established by other means into mathematical symbols is quite different from the use of mathematics as an important or even indispensable tool in reasoning. In the latter case the translation of the reasoning into non-mathematical terms often encounters serious difficulties, whereas the reverse procedure should always prove possible. This is not to say that it is always advantageous: the outstanding example of a scarcely profitable rendering of literary theory into mathematical terms is that of Whewell, who translated the doctrines of the classical economists into a rather clumsy algebra (in Cambridge Philosophical Society, *Transactions*, vol. iii, 1830, p. 191-230).

A more important and fruitful use of mathematics is the application of mathematical methods of reasoning to specific economic problems selected because of their particular susceptibility to mathematical treatment. The problems so selected are too complicated to be treated by ordinary means; their translation into mathematical terms at once simplifies the premises and permits the achievement of a higher degree of precision in the solution. The undisputed master

of the mathematical treatment of separate problems was Alfred Marshall, who maintained that "the most helpful applications of mathematics to economics are those which are short and simple, which employ few symbols, and which aim at throwing a bright light on some small part of the great economic movement rather than at representing its endless complexities" (*Memoirs of Alfred Marshall*, ed. by A. C. Pigou, London 1925, p. 313). The outstanding example of this type of mathematical economics is the theory of partial equilibria, but it is to be borne in mind that the problem of partial equilibria can be also treated without recourse to mathematics.

The most far reaching use of mathematics in economics is that in which the whole body of economic theory is organized into an interdependent set of propositions stated in mathematical terms. The only example of this type of mathematical economics is the theory of the Lausanne school, or the theory of general equilibrium, whose outstanding representatives are Walras and Pareto. They start with the notion of the mutual interdependence of all economic quantities, which is represented, in apparent analogy to certain conditions in physics, by means of a set of simultaneous equations. The problem is determined when there can be obtained as many equations as there are unknowns. In contrast to the mathematics of the kind which Marshall employed, simplicity is here sacrificed for the sake of completeness.

The first example of the application of mathematics to economics is Giovanni Ceva's *De re numeraria, quoad fieri potuit geometrice tractata* (1711). A mathematician and hydraulic engineer by profession, he was characterized by Pantaleoni as the first clear sighted mathematical economist. Half a century later his countryman Cesare Beccaria employed algebra effectively in an essay on the hazards and profits of smuggling ("Tentativo analytico sui contrabbandi" in *Il caffè*, 1765). Later two works employing mathematical methods were published anonymously: *An Essay on the Theory of Money* (1771), the authorship of which is imputed to Henry Lloyd, and *Traité des richesses* (1781) by A. N. Isnard. The latter is particularly interesting; it deals primarily with monetary theory and does not venture beyond first degree equations, but it anticipates the idea of interdependence developed a century later by Walras. Although N. F. Canard's *Principes d'économie politique* (1801) was crowned by the French Academy of Sciences

it presents merely a translation of literary theory into algebraic symbols and is worthless because of many mathematical errors. The first German contribution to mathematical economics is von Thünen's *Der isolierte Staat* (2 pts., 1826-63), containing a number of mathematical formulae of which the best known is the expression \sqrt{ap} for the natural wage, where a stands for the subsistence minimum and p for the full product of labor.

Cournot's *Recherches sur les principes mathématiques de la théorie des richesses* (1838) passed unnoticed until Walras called attention to it in 1872. It has since exercised an enormous influence and is even at present considered a masterpiece of mathematical economic reasoning. In it infinitesimal calculus is applied for the first time to an analysis of economic problems; the results are particularly telling in the discussion of monopoly. Beginning with the determination of monopoly price as that value of p which will maximize the monopolist's net revenue, or $p \cdot F(p) - \phi(D)$, where $F(p)$, or D , is the amount demanded and $\phi(D)$ the cost of producing this amount, Cournot shows that price is determinate also in the case of imperfect monopoly; from that he passes to the condition of perfect competition. Cournot's propositions regarding prices under conditions of duopoly were later attacked by Bertrand, Edgeworth, Pareto and others, but more recently economists like Wicksell and Amoroso have come to their defense. Cournot also gave the first exact formulation to the theory of cost; thus if y is the cost of x or $y = f(x)$, then the laws of increasing, constant and diminishing costs may be briefly stated as follows: $y'' \gtrless 0$. Cournot had also some inkling of the ideas of integral interdependence of economic quantities and of marginal analysis, but he did not attempt to develop them.

In his "De la mesure de l'utilité des travaux publics" and "De l'influence des péages sur l'utilité des voies de communication" (in *Annales des ponts et chaussées*, 2nd ser., vol. viii, 1844, p. 332-75, and vol. xvii, 1849, p. 170-248) the French engineer E. J. Dupuit worked out independently of Cournot both the analytic expressions and the graphs for demand and supply functions. Although he offered no systematic theory, the concepts of diminishing utility and consumers' rent were quite clearly stated by him and presented in graphical form. His definition of utility is almost as formal as that of Pareto's ophelimity. Dupuit also maintained that the price of one commodity depends upon the prices

of other goods. The presentation in quite a modern fashion of the demand and supply graphs and the assignment of market price to the point of their intersection were found later in the works of the economist Mangoldt (*Grundriss der Volkswirtschaftslehre*, 1863) in Germany and of the engineer H. C. Fleming Jenkin (*The Graphic Representation of the Laws of Supply and Demand and Their Application to Labour*, 1868) in England, but their mathematical contributions attracted little notice.

Even less attention was given at the time to Gossen's *Entwicklung der Gesetze des menschlichen Verkehrs* . . . (1854), a work containing a symbolic and graphic statement of diminishing utility with increasing consumption and of the equalization for single individuals of the utilities of different commodities at the margin. Gossen was a vigorous proponent of the mathematical treatment of economic problems, but the mathematical apparatus employed by him is extremely simple; thus in his graphs he consistently limits himself to straight lines. Although he may be considered a forerunner of both the marginal utility and the integral mathematical orientations in economics, he founded no school.

In 1871 the principle which underlay Gossen's work was independently rediscovered by three scholars. W. Stanley Jevons coined the phrase final utility, Carl Menger spoke of marginal utility and Léon Walras used the term rarity, but all of them were dealing with the same concept. Although Menger did not employ mathematical symbols he is listed by Irving Fisher in his bibliography of mathematical economics and quite properly so, for Menger resorts to mathematical methods of reasoning. This is true also of many later representatives of the Austrian school. The emphasis on subjective processes of valuation opened a new chapter in the history of economic thought. It offered a starting point for the systematic development of mathematical economics in an increasingly close relation to the generally accepted doctrines of economic theory.

The great advantage of the concept of marginal utility is that it makes it possible not only to explain the economic behavior of single individuals but also to uncover such behavior at the basis of the complex phenomena of prices, wages, interest and the like. From the fact that the total utility of a commodity is such a function of its quantity that its second derivative is negative may be deduced the negatively inclined demand curves, and these in their turn serve as a basis for the theory of exchange. The ratio of ex-

change of two commodities held by two individuals is presented by Jevons as follows:

$$\frac{x}{y} = \frac{\phi_1(a-x)}{\psi_1(y)} = \frac{\phi_2(x)}{\psi_2(b-y)},$$

where x and y stand for the quantities of the two different commodities that change hands as a result of the exchange transaction, a and b for the quantities of the two commodities held by the individuals 1 and 2 prior to the exchange, ϕ_1 and ψ_1 for the utility functions of individual 1 for the two commodities and ϕ_2 and ψ_2 for the utility functions of individual 2 for the same commodities. The law of exchange is formulated verbally thus: ". . . whenever two commodities are exchanged for each other, and more or less can be given or received in indefinitely small quantities . . . the ratio of exchange . . . will be inversely as the final degrees of utility of the quantities of commodity available for consumption after the exchange is effected" (*The Theory of Political Economy*, 1871, p. 95-96, 101). This formulation by Jevons is identical with Walras' solution of the same problem.

From this point Walras proceeded to develop the theory of general equilibrium which represents his major contribution to economics. The problem is one of determining prices and quantities in which commodities a, b, c . . . to the total number of m will exchange among themselves on the assumption that the exchange relation between a and b , for example, is influenced by the exchange relation not only of a with commodities other than b but also by each and every exchange relation existing among commodities b, c, d This condition is designated as one of general equilibrium because it posits a condition of equilibrium not only in the exchange relations of a and b, a and c and the like but also in the relations between the separate markets, such as those where a exchanges for b, b for c and the like. For each of the m commodities equations of two different types may be set up: one stating the demand for it in terms of one other commodity and having the form, $D_{ba} = F(P_{ba}, P_{ca}, P_{da} \dots)$; the other stating the equality of the value of that quantity of it which exchanges for one other commodity with the value of that quantity of the other commodity which is given in exchange. Since each commodity exchanges for $m-1$ other commodities, the number of simultaneous equations that it is possible to set up for each commodity is equal to $2(m-1)$ and the total number of equations thus obtained would be $2m(m-1)$. The number of unknowns is also $2m(m-1)$, one half of the unknowns being

the prices of each commodity in terms of every other commodity and the other half being the quantities of each commodity given in exchange for every other commodity. Since the number of unknowns is equal to the number of simultaneous equations, it follows that the problem of general equilibrium is capable of a theoretical solution. The theory of general equilibrium Walras extended also to producers' goods; in so doing he made use of constant coefficients of production, that is, he assumed that the proportions in which factors are combined in a process of production remain constant. Pareto dropped this important limitation when he substituted variable for constant coefficients.

In his *Manuale di economia politica* (1906) Pareto brought the theory of general equilibrium to the point of highest perfection. He introduced into it the concept of indifference curves adapted from Edgeworth and Irving Fisher. If an individual attaches equal ophelimity to different combinations of a number of goods—for example, if he has no preference between combinations of 1 of x , 0.9 of y and 0.8 of z on the one hand and of 1.1 of x , 0.8 of y and 0.7 of z on the other—then the equation of the line of indifference is $I = F(x, y, z, \dots) = F(\psi)$, where ψ stands for the ophelimity function of the individual. If I is constant then the first derivative of this expression will be $0 = \psi_x dx + \psi_y dy + \psi_z dz + \dots$; it is an equation expressing the equalization of the utilities of different commodities at the margin. The advantage of the method of indifference curves is that it presupposes merely the comparability and not the exact measurability of value and that it makes possible a more exact study of the relations of complementarity among commodities.

The Lausanne school, whose leaders have been Walras and Pareto, counts among its followers such scholars as Amoroso, Antonelli, Barone, Boninsegni, Furlan, Pietri-Tonelli, Ricci and others. They have all made original contributions without, however, introducing fundamental modifications into Pareto's system. Amoroso has studied particularly the theory of monopoly and the problem of dynamics; some of his contributions are incorporated in his textbook, *Lezioni di economia matematica* (1921). Barone is distinguished for his brilliant theoretical constructions in the various branches of applied economics, while Pietri-Tonelli's main work, *Lezioni di scienza economica razionale sperimentale* (1921), is a systematic reformulation of Pareto's manual. Ricci has done work in

all branches of theory, more particularly on utility curves and saving.

English mathematical economists under the influence of Marshall never abandoned the theory of partial equilibria. Perhaps the most distinguished of them is Edgeworth, who dealt in his *Mathematical Psychics* (1881) and in numerous articles (collected as *Papers Relating to Political Economy*, 3 vols., 1925) with virtually all problems of economic theory. Among other things he originated the idea of the contract curve, which presents the indeterminateness of conditions of exchange between two individuals; it should be said, however, that Menger before him treated the same notion in a non-mathematical form.

Continental scholars outside of the Lausanne school have also made numerous but scattered contributions to mathematical economics. The Austrian economists Auspitz and Lieben have produced in their *Untersuchungen über die Theorie des Preises* (1889) noteworthy constructions of cost and supply curves and formulated a number of general propositions on utility and price theory. Their work was entirely original and contains many ideas which are still of value. The Swedish economist Knut Wicksell has made a successful attempt to synthesize the Austrian psychological approach with a mathematical formulation. He also made valuable contributions to the theory of monopoly and to taxation theory. By his work on money, particularly through the distinction between real and nominal interest, he laid the foundation for the explanation of business cycles in terms of the expansion and contraction of the supply of money and credit. His countryman Cassel is better known, although he is not quite so original. Cassel took over Walras' equations in a simplified form, but in his presentation there are more equations than unknowns; that is, the conditions of equilibrium are overdetermined.

Quite recently many efforts have been made to adapt mathematical economics to a study of dynamic conditions. The Americans Roos and Evans attempted to achieve this by introducing the time element as one of the conditions in the fundamental equations. Their premises are thus made to approximate reality more closely, but the mathematical technique to which they must have recourse is more complicated than has been common heretofore. For example, in their analysis of monopoly price they employ the calculus of variations rather than infinitesimal calculus, because they work with variable price functions.

The Italian Amoroso has also been devoting himself to problems of dynamics; he places considerable reliance on analogies from physics. In general, problems of dynamics are coming more to the fore in current economic discussions, and the questions posed by the mathematical economists will undoubtedly attract the attention of literary economists.

In order to complete this survey it is necessary to mention a group of economists who work with mathematical tools in the field of inductive study. They attempt by utilizing statistical data to translate the general formulae of theory into empirical equations with numerical values for constants. Unlike other descriptive and statistical economists these investigators are not antagonistic to abstract theory; on the contrary, they regard their work as the building of a statistical complement to and as the inductive verification of pure theory. So far they have been concerned mainly with the statistical determination of demand and supply curves. Although this question was broached as early as 1838 by Cournot and although several noteworthy attempts in this direction were made by Pigou, Mackeprang and others in the beginning of the twentieth century before the development of modern methods of economic statistics, really significant work in this field was not done until very recently. A leader and in a sense the founder of a school in this type of research is the American H. L. Moore, whose *Synthetic Economics* (1929) is the systematization and crystallization of the work of a lifetime. Moore introduces statistical numbers, such as trend values, directly into the Walrasian system of equations and claims to have transformed thereby the equilibrium of static theory into a moving equilibrium. His work has elicited a number of interesting reviews and will remain for some time to come the subject of animated discussion.

The history of mathematical economics leads to the conclusion that mathematical methods of reasoning have an important place in economic theory. At times methods and types of approach which looked promising at the start had to be given up in the end, but such occasional failures do not militate against the general conclusion. In the future an increasing use of mathematics for purposes of both deduction and induction may be confidently expected. Another mark of progress would be the achievement of a closer integration between the psychological and mathematical orientations, a development which would not be hindered by any fundamental dis-

agreements between the exponents of the two types of economic theory.

OSKAR MORGENSTERN

The Cambridge School. The foundations and essential propositions of neoclassical theory were developed by the English economist Alfred Marshall (1842-1924), who taught at the University of Cambridge for over forty years; the theory is therefore often referred to as Marshallian and those who followed and elaborated upon Marshall as the Cambridge school. Marshall, who in his early days was greatly influenced by Henry Sidgwick and on particular points by Cournot and Roscher, imbibed the Ricardian tradition through the medium of J. S. Mill, whose *Principles* were at that time the gospel of political economy in England. At the same time he was arriving independently at many of the novel ideas expounded by Jevons in *The Theory of Political Economy* (1871) and developed in the seventies and eighties by the leaders of the Austrian school. By training a mathematician and in original intention a missionary of the gospel, Marshall combined an interest in formal problems of semimathematical analysis with a practical desire to make economic theory an engine of social betterment. Cambridge economics has accordingly combined a devotion to "pure theory" with a definite humanistic tendency. The social philosophy underlying it represents, like that of J. S. Mill, 19th century bourgeois liberalism with a bias toward social reform. Although it has retained in the main the classical *laissez faire* and emphasized the harmonies of competitive equilibrium and the function of individualist enterprise, it has also laid special stress on the limitations and exceptions to *laissez faire*. Marshall was the first economist in the Ricardian tradition to pass from specific exception to the harmony of *laissez faire* to a general stress on its limitations; in the work of Pigou, who succeeded him, these exceptions have formed the special theme; and in the less academic writings of J. M. Keynes, notably in his pamphlet on *The End of Laissez-faire* (1926), the liberal tenets of the classical school have received a more specific denunciation. Indeed, it is the Cambridge economists who in English academic circles take at the present time the lead in the departure from nineteenth century liberalism. It is hardly a misrepresentation therefore to say that the Cambridge school has been identified in the later phases of its development with an eclectic system of thought.

Theoretically the Cambridge school has always embodied a certain amount of eclecticism, or, as its apologists would say, it represents a synthesis of the substantial truths which have lain behind the differences of phrasing and emphasis of other schools. Marshall was fond of mathematical methods as an intellectual shorthand but distrusted the snare of oversimplified abstraction and emphasized the need for concrete study of particular situations and the search for practical results. He borrowed from the German historical school a keenness for the study of origins and of development, but he strictly subordinated such study to the requirements of analysis. He laid the foundations for his theory on the rock of Ricardian conceptions—"real cost" as the basis of value, the distinctiveness of rent, the concept of "a normal rate of profit," the basic theory of money and of foreign trade—but he built upon them the superstructure of marginal utility and demand curves and adorned it with a rococo façade of "exceptions" and modifying "additional hypotheses." Yet in it all Marshall's eye sought the design of a unified system. He found the unifying concept in economic equilibrium, where quantities balanced at the margin were poised between the fundamental forces of utilities, or satisfactions, expressing themselves through demand, and the no less fundamental forces of disutilities, or "efforts and sacrifices" (the classical "real costs"), expressing themselves through supply. It is to be noted, however, that both utility and disutility figure in Marshall's system not directly as psychological forces but indirectly as represented by their monetary equivalents. Marshall was conscious that his system was not complete. There were gaps, where conditions of equilibrium could not be consistently postulated or where the conditions necessary to determine it agreed too little with the real world; and these loose ends he always hoped to tidy before his life work was closed. Part of this work his successors, particularly Pigou, have done for him. But in recent years doubt has increased rather than diminished. The post-war generation is more skeptical than its sire and is more conscious of the loose ends that still remain untied; it recognizes that particularly in the theory of distribution there is still much that is confused and uncharted, perhaps internally inconsistent.

The neoclassical theory of value is a theory of particular equilibrium as contrasted with the theory of general equilibrium characteristic of some other schools, especially the Lausanne, or

mathematical, school. The determination of the value of a particular commodity is treated by Marshall in isolation, the prices of all other commodities being assumed to be given and constant. In this way a simplified set of equations representing the demand for the commodity and the conditions of supply of it, expressed as a demand function or demand schedule and a supply function or supply schedule, is obtained. Value is determined by the equilibrium, or balancing point, of these two sets of forces; it is given by the solution of these simplified equations. By this device of isolation certain things can be treated as constants which could not otherwise be so treated. For instance, this method neglects that reaction of a change in the consumption of a certain commodity on its price which may take place either through the effect on the amount of income spent on other commodities and on their price or through the possible alteration in the value of factors of production due to changes in the amount of them used in producing this commodity. The neglect is justified by the consideration that such reactions will ordinarily be of "the second order of small quantities."

In application to the theory of distribution, that is, to the determination of the value of the factors of production—land, labor and capital—this method meets with stricter limitations. For while it is possible to determine the value of each factor of production separately, on the assumption that the problem of distribution is solved for all other factors, i.e. that their values are given, it is more doubtful whether, if they are all treated as variables at the same time, the complete system of simultaneous equations is capable of satisfactory solution. Solution is possible on certain assumptions such as that the technical coefficients and the supply of the various factors of production are constant; but without these assumptions the result is more complex and at the same time more questionable.

Unlike the Austrian school and Cassel, who assume the supply of the factors of production to be determined independently of the price paid for them and so treat them as constants in their equations, the Cambridge school employs the important distinguishing conception of a supply price for the factors of production other than land, the schedule of supply prices relating the supply of them to the prices offered. In equilibrium the price of each factor equals its supply price at the margin of its use; and this in turn represents the real costs, the efforts and sacrifices

involved, as measured in money. The result is an imposing symmetry: just as utility, or satisfaction, underlies demand and figures as the quantity to which the system of demand schedules is related, so disutility, or effort and sacrifice, underlies supply and represents the "real costs" to which the system of supply schedules is related.

In the theory of distribution the lines of the classical tradition show most strongly. The Ricardian concept of rent is retained as the example of a surplus par excellence—the return to a factor which involves no effort or sacrifice in the supplying of it and no supply price. It was characteristic, however, of Marshall's treatment that he considerably softened the rigidity of the distinction between rent and profit. Rent of land was not a unique and exceptional phenomenon in the field of distribution; "it was but the leading species of a large *genus*." In the case of capital and labor a surplus payment would also appear, in so far as interest and wages, determined as they tend to be by the marginal supply price, exceed the average real cost and the average supply price of the total amount of capital and labor employed. Hence the appearance of a number of types of "producers' surplus," symmetrical with the "consumers' surplus" on the side of demand, or the surplus utility which buyers obtain because they can purchase commodities at a lower price than they would pay rather than lose the enjoyment of them entirely.

In the treatment of surpluses Marshall made particular use of the conception of time. In fact, in his handling the border line between a rent payment and other payments reduced itself to a time differentiation. In a period shorter than the duration of life of fixed capital the supply of such capital was as unchangeable as that of land. Moreover, the real cost involved in its creation was a thing of the past, exerting no direct influence on the present. Hence the return which this capital received was determined at any given time by conditions of demand and bore no precise relation to its supply price. For the yield of fixed capital viewed in its short period aspect Marshall coined both the term and the conception of quasi-rent. The conception also extended to various short period fixities in the supply of labor, e.g. skilled labor which required a period of training and education to produce it. But from a long period standpoint the supply of such capital would adjust itself responsively to the reward it was obtaining; and in conditions of static equilibrium interest would tend to equal the normal supply price of capital—the aspect of quasi-rent

would disappear. It is to be noted that in contrast to a number of American and European economists the Cambridge school includes profit, as the earnings of business enterprise, in this general framework. From a short period standpoint profit represents a pure surplus, which can be taxed without any effect on cost of production. But in the long period the supply of business enterprise tends to adjust itself to the actuarial expectation of profit, so that long period normal profit in the "representative firm" of an industry tends to equal the normal supply price of business enterprise.

In the theory of increasing returns Marshall was responsible for clarifying a great deal of confusion. This he did by his distinction between internal and external economies of large scale production, the former being relevant to the size of the firm and the latter to the size of the whole industry. On this he based the distinction between the supply curve of an individual firm and the supply curve of the whole industry; the latter represents the equilibrium costs, i.e. the costs at the point where marginal and average costs are equal, of the representative firm in the industry at different stages of the industry's growth.

Pigou has considerably developed the theoretical conception of his predecessor in relation to a number of problems of applied economics. Taking as his norm the desirability of maximizing economic welfare, he has laid down important criteria of economic desirability. Thus, other conditions remaining unchanged, a given amount of wealth will yield more welfare the more equally it is distributed. And again, *ceteris paribus*, the production of wealth will be maximized if productive resources are so distributed that the net social yield to a marginal unit is equal in all uses. He then proceeds to an inquiry as to the extent to which laissez faire and various conditions of monopoly tend to fulfil or to violate these principles and as to the circumstances under which state interference would promote a closer approximation to the optimum. In particular, developing a hint of Marshall's and using the latter's important conception of external economies, he has established the proposition that conditions of laissez faire will result in a scale of investment and output less than the "desirable" in industries subject to increasing returns.

The Cambridge school has always given an important place to the theory of money and of foreign trade, both of these being treated as particular cases of the general theory of value. Here especially the main lines of the classical tradition

have been closely followed. Marshall restated Ricardo's theory of purchasing power parity and of the mechanism of gold movements in relation to the foreign exchanges; and he developed the classical theory of foreign trade in terms of elasticities of demand. In recent years a significant formal change has taken place in the statement of the theory of money, the demand for money being conceived as "the volume of wealth, the command over which people desire to hold in the form of money balances"; changes in this demand are regarded as of equal importance with changes in the supply of money in governing the level of prices. Most recently Keynes in *A Treatise on Money* (2 vols., 1930) has formulated an entirely new set of "fundamental equations," the gist of which consists in an emphasis on the ratio between saving and investment as affecting the level of prices and the volume of production and employment and on the influence of the action of the central bank on these two factors, particularly through the discount rate.

In the last decade two tendencies have shown themselves among the younger members of the school. On the one hand, there has been a tendency to concentrate on practical problems, particularly the problem of the business cycle (Pigou, D. H. Robertson and Keynes). On the other hand, there has been a certain tendency to question and to revise. Thus Sraffa has raised some important questions concerning the adequacy of the conception of costs. H. D. Henderson has dissented from the orthodox distinction between rent and other payments. The adequacy of the theory of distribution has been questioned by Maurice Dobb. Keynes and Robertson have effected important restatements of the theory of money. How far the school will continue to be marked by its characteristic uniformity and which direction its contributions may take in the future time only can show. But so far the most noteworthy feature of neoclassical theory has remained its attempt to create a unifying concept of economic equilibrium by effecting a synthesis of the classical and the Austrian points of view. It is by its success or failure to achieve this unity that it must ultimately be judged.

MAURICE DOBB

The Historical School. The historical school is German in its origin and the character of its teaching. Unlike the classical school and the school of marginal utility, it did not formulate a set of positive doctrines, having attained its uni-

ty at first through opposition to classical theory as transplanted to German soil. In its German adaptations classical economics comprised several variants. At the beginning of the nineteenth century it was mixed with a considerable dose of traditional cameralism. Later some expositions emphasized Smithian doctrines, other Ricardian economics and still others followed in the main J. S. Mill. In the heyday of "liberalism" it exercised a most far reaching influence in the distorted form of Manchesterism. It is not surprising therefore that even greater differences are to be found among the writers of the historical school. The later exponents of *Historismus* were quite aware of these divisions. They regarded List as the forerunner, Roscher, Knies and Bruno Hildebrand as the founders of the older school, which they distinguished from the younger school, whose most outstanding representatives may be considered Schmoller, Bücher and Georg Friedrich Knapp. These distinctions may now be regarded as obsolete. List was assigned a separate position because he was an academic outsider and because his importance for theory was not recognized by his first biographer, Ludwig Häusser, in 1850 and was generally ignored for a long time. Since the discovery in 1925 in the archives of the Institut de France of the manuscript of his Paris prize essay, *Das natürliche System der politischen Ökonomie* (1838; tr. from the French and ed. by E. Salin and A. Sommer as vol. iv of *Schriften, Reden, Briefe* . . . , Berlin 1927), there is no further reason for not considering him a member of the historical school proper. Similarly the division into an older and a younger school is no longer fundamental. It is true that Roscher was an industrious compiler working from secondary sources and that Schmoller, influenced by Ranke, attempted in his work on economic history to go back as far as possible to original sources. Yet in the final analysis this was merely a personal difference of no greater importance than other personal differences found within each of the two schools. Nor was it really characteristic of the distinction between the two schools; Sombart, for example, is in this respect closer to Roscher than to Schmoller.

Other more significant distinctions may be observed between the older and the younger schools, but none of them really impairs the fundamental unity of the historical school. One of these distinctions is found in the attitude toward classical theory: whereas the older school was satisfied merely to supplement it, some rep-

representatives of the younger school thought to supersede it entirely. The establishment of the proper relation between history and theory was one of the most important achievements of the historical school, and these different attitudes were merely stages in the process by which the school arrived at the correct conclusion. Another and perhaps the most comprehensive distinction is that the older school, active before the founding of the German Empire in 1871, was preoccupied mainly with economic theory, while with the younger school emphasis shifted to problems of economic policy. The members of the older school, none of whom resided in a capital city, had scarcely any occasion for work in the field of economic policy and Roscher carefully avoided such entanglements, whereas Schmoller, who during his thirty-five years in Berlin was in close touch with the rising empire, was temperamentally impelled to influence the making of policies by the weight of his academic authority. The founders of the Verein für Sozialpolitik (1873) were anxious to help in the building of the empire; they were particularly concerned with the rise of socialism, which was interpreted as a threat to the young empire, and hoped to undermine its power by working out a consistent policy of social reform. Thus it came about that in opposition to the classical economists' preoccupation with static relationships the older historical school put its chief emphasis on problems of development and the younger school on the formulation of norms for the future. From the vantage point of the present this distinction too does not appear as significant as it once was; it may be treated as a difference between successive phases of a unitary development, which the historical school represents in the history of economic thought.

When in the beginning of the nineteenth century the doctrines of classical economics began to spread to the continent, they needed a great deal of correction and adaptation to prove acceptable to the non-English student. Based on factual material almost exclusively English and designed to influence English economic conditions, this theory bore in many of its parts a national English stamp. The fact that English scholars naturally were not aware of this made it possible for them to claim universal validity for a body of theory which was so distinctly a product of English conditions. In Germany efforts were soon made to supplement and rectify it.

The first of such efforts made by List grew out of his practical experience. As business man

and politician in both the United States and Germany he became convinced that the chief task of the economic policy of both countries must be a defense against the superiority of English industry. England might well be content to preserve what a kind fate had given her; a passive policy of free trade was entirely in accord with her interest. Other countries had still some way to go before they reached the point at which England stood; they must therefore consider a purposeful policy of development of their "productive forces." For those countries which lagged behind England an active and consistent economic policy, especially a policy of protection, was requisite. So long as List remained interested in purely practical purposes he demanded that every country should evolve independently of the English tradition a national economic policy in accordance solely with its own needs and develop a national economic science to correspond with the policy. But he soon realized that such a solution was logically impossible. Like every other science economics cannot renounce the principle of universal validity; even for practical purposes such a renunciation would betoken a dangerous weakness. He thus became aware of the necessity for supplementing classical theory in such a way as to make it applicable not only to England but also to countries not so highly developed. He attempted this in his doctrine of stages.

The need of supplementing classical theory in another direction was also early perceived by List. The importance of the great developments in the field of transportation which occurred after Smith and Ricardo had passed from the scene was virtually ignored by their followers. Having been able to observe the beginnings of the railway in England and having taken a leading part in Pennsylvania in the building of one of the first American railways, List recognized the economic significance of the fact that with the introduction of steam the principle of large scale production was extended from manufacturing to transportation. In numerous articles in periodicals he formulated the principles of railway and waterway policy and ranked it as almost equal in importance to commercial policy. In this field List's role was that of a practical railroad man who benefited his country and science by the rich fund of his early experiences. It was Knies who first attacked the problem of transportation and communication as a scholar (*Die Eisenbahnen und ihre Wirkungen*, 1853; *Der Telegraph als Verkehrsmittel*, 1857). Only twenty

years later were such studies resumed on a larger scale by men like Gustav Cohn and Alfred von der Leyen. The historical school was thus responsible for pioneering work in the scientific treatment of the economics of transportation.

Although the third lacuna in the classical doctrine was not so apparent it has proved to be an even greater obstacle to the acceptance of classical theory. The great agrarian reforms of the early nineteenth century turned the interest of science toward the study of agrarian regimes. Hanssen, who began his work in the thirties, was the first to undertake this study in a large way. He taught that the existing agrarian institutions, at least those of the European continent, can be correctly understood only as a product of the past and the types of village settlement only as a function of the national genius. He showed thereby that the study of economic history may be of service for practical purposes. Of the school which he founded Georg Friedrich Knapp is the outstanding representative. Knapp became the most distinguished student of German agrarian conditions and displayed an unequaled ability in stimulating and training other students of the subject. It was due largely to Hanssen and Knapp that the systematic pursuit of agrarian studies has become one of the solid characteristics of the historical school.

These additions to the body of classical economics—the scheme of developmental stages, the new discipline of transportation and the study of agrarian history—laid the foundation of the historical school. It is clear therefore that the school was deeply rooted in German soil, that it was a response to the practical needs of German economic life of the time and not, as Karl Menger believed, a superficial imitation of the developments in related sciences, an artificial creation of ambitious scholars. It is true, however, that the intellectual climate of the period also favored the creation of such a school.

At the opening of the nineteenth century the new emphasis on the idea of evolution and the progress of the historical method produced an efflorescence of a number of social sciences in Germany. Roscher wanted to build a historical economics along the lines of historical jurisprudence created by Savigny and Eichhorn, and Bruno Hildebrand took comparative philology for his model. As stated by Roscher, they thought it necessary to institute an economic comparison of all the peoples for whom information was available. Roscher carried out this notion but rather superficially. He read through all the more

important secondary works in German and foreign tongues and noted carefully everything that seemed to depart from, or to agree with, the classical doctrines. One result of this study was to ascertain the extent to which the general laws of economics applied to agriculture and forestry, industry and trade, in the various countries. Thereby Roscher became the true founder of the discipline of applied economics. Rau was the author of the first German text of the new discipline, which he called economic policy. He treated it in juxtaposition with, but without any organic relation to, the theoretical economics of the English classical writers; and he had included in it in addition to many elements of the old cameralist lore a quite unsystematic collection of practical counsels and rules. In contrast with this Roscher, who denied the possibility of a science of economic policy, wished to effect a connection between the special branches and the central theory of economics by treating them "as a geographical map rather than as a travel guide." It was due to Roscher that an interest in applied or special economics has become traditional with the historical school. Later writers again partly lost sight of the connection between applied and theoretical economics; instead, attempts were made to build up a comprehensive science of society, the feasibility of which Roscher denied.

In the field of theoretical economics Roscher has left fewer traces. It is true that he proposed the transformation of classical economics into a study of the laws of economic development and distinguished periods in the course of such development. But he did not get beyond establishing a superficial analogy with the life of an individual and distinguishing accordingly periods of infancy, adolescence, maturity and senescence in the life of nations; occasionally he used also the factors of production as the basis of his classification. The decisive advance in this field was made by List. In contrast with Roscher's superficial periodization he set up the doctrine of the progressive evolution of productive forces, and by grafting this form of evolutionism upon the body of English static economics transformed the latter from the mere intellectual reflection of English economic supremacy into a true science of universal applicability, thus validating its formerly unjust claim. Thereby he provided the same theoretical justification for the protective and educative economic policy of other countries as the incomplete doctrine of classical economics had previously furnished for England only. This was a great achievement in the field of

theory, which was not recognized until very recently.

Since the time of List the doctrine of stages has been an integral part of German economics, but List's own scheme of stages was subjected to many specific criticisms. Bruno Hildebrand has certainly not improved on List; the principle underlying his scheme is illogical. Schmoller's scheme emphasized political and administrative organization rather than economic factors. Karl Bücher was the first to find a really satisfactory solution. By making use of the idea of a self-sufficient domestic economy, which engaged the attention of Rodbertus, and by adopting from Schönberg as well as Bruno Hildebrand and Gierke the concept of a city economy, Bücher succeeded in setting up a scheme of stages which brought to the surface the forces that lead to a transition from one stage to the next. This contribution completed in outline the process of universalization of classical economics.

Yet the actual execution of this task still required considerable effort. It was not merely a question of intensifying historical study. As the historical school became increasingly opposed to the deductive character of classical economics it welcomed every means of dealing with factual material. Along with the historical studies encouraged by Roscher and Schmoller came the statistical studies which Knies especially sought to advance. In 1850 Knies published a monograph, *Die Statistik als selbständige Wissenschaft*, which attempted to clear up the bewildering confusion in the theory and practise of statistics. Later the discussion of the problems of statistics, to which Knapp also gave some attention, came to be increasingly detached from historical economics and formed a separate discipline handled by statisticians.

With the ever growing amount of concrete work done by the school, it was pressed more and more to pay attention to methodological questions, to give itself an account of the meaning and scope of its activity. Such questions have been recurrently raised ever since the crystallization of a science of economics. Even among the mercantilists and physiocrats, between Ricardo and Malthus, J. S. Mill and Senior, they have come to a head in polemical discussions. Among the classical economists, however, these disagreements were limited to personal differences of opinion which did not disturb the unity of the school on fundamental points; the doctrines of Smith, Ricardo and Mill maintained their sway. It is only with the ap-

pearance of the historical school that disputes about method assumed the proportions of a conflict between schools. Methodological discussion in which the historical school engaged has passed through three successive stages.

In the first stage Knies stood in the foreground. Although unlike Roscher and Hildebrand he was not a true historian and has but sparingly applied the historical method in his writings, he has become the theoretical founder of the historico-psychological economics in Germany, as Schmoller correctly observed. His *Die politische Ökonomie vom Standpunkte der geschichtlichen Methode* (1853) was the first book on economic methodology. In this work he dealt exclusively with that tendency in the classical school which refused to recognize the hypothetical character of its abstractions and which regarded its theory as an undistorted conceptualization of reality. Like List and Roscher he combated the absolutism of the theory, which claimed equal validity for all ages, countries and nations. He proclaimed that rigidity contradicts the very idea of life; more specifically, the two concepts most important for economics, private property and self-interest, are not logical but historical categories. It was still possible to establish laws about those attributes of economic phenomena which persist as the common element alongside of individual variations; but these generalizations must assume the form of evolutionary laws, the content of which varies with the stage of development; even for limited stages they cannot be regarded as absolute norms because of the importance of irrationality, the unpredictable of the personal equation. It will be observed that Knies' moderate position in no wise challenged the *raison d'être* of the classical school.

In the second stage of the discussion the historical school went much further, although not without some hesitation and partial recantation. Schmoller, who was the chief spokesman at this stage, regarded the classical theory as a "premature generalization." He thought it essential first to fashion in careful monographic studies of the past and present the bricks with which the structure of general theory would later be built. Only thus could the closet speculations of abstract economists be transformed into a living science rooted in experience. Only after an examination, from all possible angles, of those elements in economic life which have so far been insufficiently studied, particularly the "psychological-ethical" factors, will there be a science of

economics "in the strict sense of the term." It will emerge imperceptibly out of monographic research and will differ from the theory preceding it by conceiving differently the function of morals and law in economic life and by assigning to the state a position altogether different from that which it was given by classical theory, because the latter concentrated so much upon the individual that it often overlooked social formations of which he was a part.

Schmoller later abandoned this very extreme position. Apparently under the influence of the criticism of Karl Menger, the head of the Austrian school, and of his friend, the Berlin philosopher Dilthey, he admitted that "the historical school had perhaps been too cautious regarding generalization and theory" and even that there may be a justification for abstract theory as a part of general economics. He desired "not at all to neglect theory but only to build the necessary groundwork for it."

In this significant change Schmoller may have been influenced by the turn which discussion took in the third stage, associated chiefly with the name of Max Weber. In this stage two questions were mooted. Debate waxed warmest over the place of value judgments in science: should science confine itself to an analysis of what "is," or may it not also set up ideals, lend the weight of its authority to some notions of what "should be"? It was sought to draw more clearly and sharply the line of demarcation between science and politics, which had hitherto been thoughtlessly ignored. Even if an overlapping could not be avoided in practise, it was still necessary to impress the essential difference between the two upon the mind of every scholar at the beginning of his career.

The second question, which was discussed more calmly and had a more stimulating effect upon subsequent scientific developments, related to the typological method. This method involves simplifying the picture derived from experiential reality in order to obtain a tool for a more satisfactory understanding of the particular and individual. In this process emphasis is laid not upon the generic but upon the historically significant which is isolated and crystallized into what may be called ideal limits or "marginal ideas," with which the concrete reality is to be compared. This device, which was called by Max Weber (following Jellinek) the method of ideal types, can be effectively used only by a scholar of broad erudition and sure grasp.

The typological method was no new dis-

covery. Since Plato and Aristotle it had been repeatedly applied unconsciously by prominent writers. The same was true of the historical economists, whose doctrine of stages is a good illustration of this method. In the continuity of the historical process no stages are discernible; they are merely conceptual devices which facilitate the understanding of the specific features of this or that historical development. The two members of the historical school who worked best with this method, Bücher and Knapp, combined theoretical analysis with factual study, and as a result their theory more or less inevitably assumed the form of a series of ideal types. Bücher applied this method with an increasing awareness of its technique and implications. After employing it successfully in his schemes of stages for general economic history he used it quite as effectively in his studies of industrial organization and of division of labor. Knapp, who was inclined to think in concrete images, had unconsciously taken the same route. In agricultural and industrial economics, the special branches of applied economic science in which they worked, Bücher and Knapp achieved by using this method that blend of theory and description which was desired and insisted upon by Roscher. In the work of these two scholars may be found the most valuable specific achievements of the historical school.

Sombart took another road. Impressed at the beginning of his scholarly career by Marx' *Das Kapital*, he set out to continue Marx' economic work, to present the economic history of Europe as a process revolving about the rise and development of capitalism. While Bücher and Knapp attempted an intensive study of important special aspects and areas of economic development in order to arrive at specific type constructs, Sombart desired by taking the present economic order as his point of departure to organize the totality of economic life into "economic systems." Thus he arrived at the distinction between periods of precapitalism, early capitalism, fully developed capitalism and late capitalism. Unlike the clear cut ideal types these constructs are so complex that they cannot be very helpful as a framework for picturing the variegated complexity of economic reality. Sombart's contribution has also been confused by the fact that in the course of his protracted labors on *Der moderne Kapitalismus* (3 vols., 1902-27) he changed from an adherent of Marxism to its opponent and in connection with this shifted his emphasis from the materialistic conception of a

"striving capital" to the psychological factors, the mentality and ideals of the economic agents. Thus despite his intentions Sombart's historic systematization cannot be regarded as the realization of the program of the historical school. His work is similar in this respect to Roscher's *System der Volkswirtschaft* (5 vols., 1854-94) and Schmoller's *Grundriss der allgemeinen Volkswirtschaftslehre* (2 vols., 1900-04). However admirable as an achievement of amazing scholarship, neither of these works may be viewed as an important turning point in the progress of economic theory.

The real accomplishment of the historical school is to be sought not in this or that specific contribution but in securing recognition for the historical and statistical methods of economic investigation. In the first phase of the development of the historical school this recognition had not yet been adequate, since Roscher treated history merely as raw material for theory. In the second phase Schmoller had taken the stand at the other extreme by assigning to history primacy over theory. In the third phase historical and descriptive studies were brought into proper relation to theory in the methodological contributions of Max Weber and the correct relation between the historical and the theoretical approaches exemplified in the work of Bücher and Knapp. History and theory must be treated as correlative and mutually interdependent approaches. The ascertainment of facts and of causes, of the universal and of the particular, must go hand in hand. The economist must not overlook, to use the words of Dilthey, "the relation of the abstracted part to the living whole," nor must he avoid the use of abstraction. Theory alone remains partial knowledge, and history without theory is unsatisfactory. These are considerations which must be constantly borne in mind; the mature scholar must follow them in his researches, and the beginner must make them an integral part of his instinctive approach to the subject.

The achievements of the historical school have not been won without grave errors and onerous sacrifices. Although it inspired great hopes and stimulated scholars to industrious researches the unqualified hegemony of the historical school led to a considerable degree of stagnation in German economics because of its isolation from the movement of economic thought in other countries. The criticism and later the complete rejection of classical doctrines barred German economists from taking an interest in the refine-

ments upon classical theory produced by foreign scholars. The violent polemic between Schmoller and Menger turned German economists away from marginalist economics, which had been more popular throughout the world than any other school of economics. The slighting of theory and the consequent lack of serious criticism of socialist doctrine helped Marxism to strike deep roots in Germany. The consequent isolation of German science from the international community of economic scholarship and the resulting provincialism of German economics have been overcome only slowly and with difficulty.

The historical school has extended its influence beyond Germany and found adherents in England and in the United States, in France, Italy and the Scandinavian countries. In none of these countries, however, has there been a school resembling the German, because the following has been limited to a scattering of individual economists. The success of the historical school outside of Germany can in no way be compared with that attained later by the school of marginal utility.

A movement bearing a superficial resemblance to the historical school began quite recently and has been meeting with increasing international recognition. It is different in its origin from the historical school and is related to statistics rather than to history. While the historical school came into being in order to cope with the problems of immaturity in economics, the new school is a response to the needs of a mature if not excessively mature economics. When the historical school attempted to adapt English classicism to conditions in other countries, its task was to supplement and rectify classical doctrines by impregnating them with factual material bearing on economic conditions outside of England. At that time such material was scarce, and in order to fill this gap the school proceeded to its lasting credit to encourage all types of factual study, qualitative and quantitative, historical and descriptive. At present there is no lack of such material in the larger countries, and the most advanced suffer from a superabundance of it. The daily mounting quantity of factual material has become so enormous that no single investigator is able to master it or even to obtain a clear view of it. It has become necessary to devise new methods in order to facilitate the handling and utilization of the material for scientific as well as strictly practical purposes. The new methods are important not only in order to make the most of

available statistical data but also to prevent the superabundance of statistics from destroying the unitary framework and impairing the scientific character of economics. It is the superabundance of factual data that leads to ever growing specialization among economists; even by now this has progressed so far that with the passing of the older generation there will be scarcely anyone to claim mastery of the entire domain of economics. Should economics lose its unitary character it will cease to be a science of the economic life of society and will become a loosely coordinated series of business disciplines. The present day statistical school is thus called upon to perfect new methods for the effective utilization of a stupendous mass of statistics for purposes of economic generalization and to integrate these generalizations with the main body of economic theory. It is obvious that the problems of the new school and the sphere in which it is apt to render its greatest service are quite different from those which gave an impetus to, and earned lasting recognition for, the historical school.

HERMANN SCHUMACHER

Socialist Economics. Socialism is not an economic theory nor a school of economic thought in the sense of the classical school or that of marginal utility. It is a term attaching to a series of movements which rest more or less upon a foundation of social and economic doctrine. The movements derive their vigor from ethical and to a certain extent religious convictions, and in so far as they make use of economics the elements are borrowed from all currents of economic thought. Yet socialist theory tends to emphasize the notion of objective labor value and conceive of economic theory not as the analysis of a universal economic process, but as the establishment of laws of development of capitalist economy.

With regard to economic theory a distinction must be drawn between the older socialism and the modern socialism. The older socialism is the product of a social will that seeks to combat and abolish all injustice and exploitation, all want and misery, by calling social forces into play, by creating a new distribution of power in society and in particular by abolishing private property. The newer socialism is rooted in the pauperism produced by early capitalism and later in the will of the modern industrial proletariat; it lays bare the structure of capitalist production and the place of the proletariat within it and calls for a socialization of the productive

forces, the control of all production by society or the proletariat.

The older socialism comprises all those religious, ethical and political doctrines which aim at abolition of mass poverty and the injustices of government. It includes also the so-called socialist mass movements which at the close of the Middle Ages and in early modern times resulted from the impoverishment of the peasantry. These movements are naturally characterized by an attack on large private fortunes and even on private property in general and by a questioning of power derived from the possession of large landed estates. But their ideology is not based upon an analysis of the economic system nor have they attempted to disclose its driving forces, to discover the laws of economic change. From this point of view the older socialism includes also the whole range of social utopias, beginning with that of Thomas More, and the entire literature of social reform characteristic of the age of Enlightenment. Older socialism appealed either to the religious and moral sense or to the intelligence of the ruler; sometimes it relied upon the power of the organized poor. It was quite clear as to the goal but was ignorant of the social processes which might lead to it. Since it was not cognizant of the underlying social structure it tended all too easily to mistake political transformation for social reorganization.

Not until the nineteenth century was socialist ideology linked to a recognition of economic realities. Such recognition did not come suddenly; it appeared piecemeal in the work of various writers. The factor chiefly responsible for the change was the association in revolutionary movements of the proletarian masses with the liberal bourgeoisie and with their demands for autonomy in social and economic affairs. It is significant in this connection that Saint-Simon both propounded the doctrine of industrialism which laid the theoretical foundation for large scale enterprise and originated a trend of thought which was socialist in character and denied justification to private property.

Marx was the first to combine socialism with a historical and theoretical analysis of economic processes and to transform socialism from a utopia into a science. Just as the intellectual comprehension of capitalism made possible the deliberate building up of modern industrial society and the establishment of the primacy of industrial interests in economic, social and political life, so Marx' economic analysis laid the foundations for a modern labor movement.

Marxian socialism grew out of a study of industry, particularly English industry, and yet it is not merely an analysis of this economic form from the point of view of labor. It attempts a comprehensive analysis of the historical process, whose peculiar characteristic, the class struggle, is most marked in the industrial phase of European development. The understanding of the historical process is so decidedly the main problem of Marxian socialism, the laws of economic development are so definitely associated by it with the laws of social, political and even spiritual change, that the theoretical analysis of industrialism and the concepts employed in this analysis are assumed to contain an indication of the social superstructure of industrialism and of its underlying trends toward socialism. To call this theory mechanistic is therefore grossly to misrepresent it. It is really the first attempt on a large scale since physiocracy to grasp modern economic life in its totality and to treat it as a generating force of the corresponding forms of social organization and development.

As an economic theory Marxian socialism takes classical economics as its point of departure; indeed, as a by-product of his study of classical doctrines Marx produced a most valuable technical analysis of them (*Theorien über den Mehrwert*, 3 vols., published posthumously, Stuttgart 1905-10). It adopts from the classicists particularly the notion of labor value, although not as an eternal and unchanging principle, and investigates its operation in industrial society. For the economics of Marxism is not merely a conceptualization of economic processes *in vacuo* but an attempt to solve the enigma of capitalist economy. Like all presocialist economic systems capitalism rests on exploitation. This exploitation does not assume a political form, is accomplished not through the use of sheer force and political domination as in feudalism, which squeezed out of the peasantry a part of their earnings in feudal services and taxes, but is concealed through the operation of the laws of exchange.

These allegedly eternal laws of exchange are only the rules of the game in a society divided into classes and in a "free" market in which people meet on the basis of a mere formal or legal equality. In this market the entrepreneurs, who monopolize all the means of production, bid for the labor power of the workmen, who although personally free are without means of subsistence and hence must sell their services. Had

the laborers owned property they could have utilized their labor power themselves; there would then be no category of capital, that is, no dependence of labor upon the possessors of the means of production. It was not hard work and thrifty habits that brought about the concentration of capital in the hands of the capitalists, as some of the primers of economics for the nursery would have one believe. The concentration of the means of production, including land as well as capital in the narrow sense, was accomplished through the processes of original accumulation—the use, direct and indirect, of political compulsion, the levy of war tributes, the exploitation of colonial resources and populations. In the course of the ensuing capitalist development the accumulation and concentration of capital was based on the exploitation of labor, which is possible as a continuous process because the bargain in the labor market is not a bargain between equals but an exchange "between a money-bag and a hungry stomach."

The economic power possessed by the employer is part and parcel of a system functioning in accordance with certain laws. The great law of economic action, the law of value, controls all spheres of economic life; it regulates the relationships in the labor market and thereby determines the mode and rate of exploitation of the labor power of the propertyless worker. The only commodity possessed by the worker is labor power, and as a commodity it is subject to certain peculiarities. It is not a material object but a potential quantity of human labor. Two different types of value attach to labor power: one is its production value, derived from the fact that labor power itself must be produced; and the other is the value produced by labor power. Labor power is produced through the consumption of means of subsistence in such quantities as are necessary to maintain the worker and to support his family in order to allow for the continuation of the race. On the other hand, every employer who has purchased labor power is also acquiring the opportunity to use it in producing a greater value than that of the labor power itself. Whether a surplus of value is to be produced depends on the average upon the length of the "necessary working time," i.e. upon the cost of production of the labor power, and upon the customary length of the workday. If, for example, all the means of subsistence requisite for the production of a day's unit of labor power of an adult man can be produced in six hours while the worker is kept at work for twelve

hours daily, then the employer will be in possession of a surplus value of six working hours. Thus a surplus, a profit, which becomes in the capitalist economy the most important source of new capital, can be continually obtained entirely in accordance with the economic law of value.

The exploitation of labor power does not signify an injustice by the standards of the capitalist system, for the workman receives the price of his labor power in accordance with the law of value. It is not the ill will or the chicanery of the individual capitalist that holds the proletariat in a vise, but the economic system as such, the relations of production. Within the capitalist system labor power must be sold in the market as a commodity and must serve therefore as an object of exploitation. The operation of the law of value in the labor market, the transformation of the labor market into a commodity market, is intimately connected with the "relations of production," the polarization of society into capitalists and proletarians. With the collapse of these "relations of production"—for instance, with the abolition of private property in the means of production or with the creation of means of production freely available to everyone—the capitalist system of production would break down, because the laborer would not be forced to submit to the conditions hitherto prevailing in the labor market. The only solution is therefore to transform labor into a free personal service, i.e. to destroy the polarization of society, to break down class stratification, to appropriate for society the power to dispose of the means of production, and thus to abolish the exploitation of man by man.

The law of labor value in a socially and economically polarized society explains the exchange relationships of all commodities, including the exchange of labor power for commodities and the existence of interest and rent, which are merely diverse forms of surplus value; i.e. value created by the worker for which he receives no equivalent in wages. The worker is the only productive force that creates new additional values. Capital, the means of production in the broadest sense of the term, imparts to the product as much value as it possesses itself but it is not a source of new value. The average rate of profit is determined by the amount of capital in society and by the efficiency of the labor force; i.e. by the number of the "necessary" hours of labor, the duration of the average

working day and the number of workmen. The average rate of profit is thus merely the ratio of the aggregate surplus value to the value of the total capital of society. The specialization of production by branches, the division within these into individual concerns and the existence of commerce which is not productive in the Marxian sense produce a discrepancy between prices and the values determined by the labor law of value. This discrepancy is governed by the organic composition of capital in the various enterprises; i.e. by the relation between the constant portion of capital, invested in raw materials, equipment and the like and merely reproducing its value in the final product, and the variable portion of capital, representing outlay in wages and resulting in the creation of surplus value. Prices are theoretically explicable just as values are; contrary to Böhm-Bawerk's opinion their theoretical derivation does not disregard the law of value of capitalist society.

Capitalist production for profit is by its very nature dynamic; it strives for an increase in the quantity of output in order to increase profit. Each entrepreneur seeks to expand his business and thereby lets loose dynamic forces which through a process of dialectic development prepare the dissolution of capitalist industrialism. The most important dynamic factor is technical progress. It brings about the displacement of handicrafts at the central points of production, the transformation of small concerns into large, a reduction in the number of enterprises, a concentration of capital, an increase in the mass of the proletariat and, by heightening the efficiency of labor and creating an industrial reserve army, a rise in the rate of surplus value and of profit. Thus the number of proletarians grows at the same time that the number of capitalist entrepreneurs declines; economic crises, the result of planless production, become ever more serious; and the capitalist system comes nearer and nearer a social revolution in which society will take over control of the productive forces. This will mean the destruction of the capitalist class, the abolition of class stratification and the inauguration of the direction of production by society in accordance with social needs rather than with the exigencies of profit making.

In the socialist system of thought all concepts are not only economic but also sociological, and economic theory is concerned not with the comprehension of universal economic processes but with the elucidation of the capitalist production

process. For this reason the concepts dealt with are by their very nature dynamic and envisage a development whose end is the abolition of the present economic system. This development is regarded therefore as a historical process in which the form of economic action and particularly the social structure of the economic body will undergo a radical change.

The linking up of theoretical economic with sociological and historical concepts is characteristic of all varieties of modern scientific socialist thought. Pre-war revisionism, as represented in Germany by Bernstein, had no objections to offer against this synthesized consideration of economic and social processes. In the purely economic sphere it attempted merely to take account of the points of view introduced by the marginal utility school. It also criticized many of the forecasts of future development made by orthodox Marxians, particularly the law of concentration and the thesis that economic crises will become increasingly serious and will lead to dialectic revolutionary reversions from capitalism to socialism. Revisionism defended an evolutionary point of view and attached more weight to voluntaristic factors. But like orthodox Marxism revisionism envisaged economic processes in historic flux and objected to an analysis of economic phenomena in terms of universal laws and to a conception of a market which overlooked the facts of social stratification.

The further development of the economic doctrine of socialism is to be looked for particularly in the writings of Rudolf Hilferding and Rosa Luxemburg. They have attempted to interpret the economics of developed capitalism from the standpoint of socialist thought. Thus Hilferding's *Das Finanzkapital* (Vienna 1910) is an analysis of that stage of capitalism in which under the influence of large financial and banking institutions the small independent entrepreneur is displaced by large aggregations of capital in the form of corporations and cartels. It offers a closer analysis of the processes of concentration and their consequences, of the aggravation of maladjustments between the various branches of production and of the intensification of the frequency and severity of crises. While Hilferding's book is a theoretical analysis of concrete economic developments, the *thema probandum* of Rosa Luxemburg's *Die Akkumulation des Kapitals* (Berlin 1913) is that capitalism needs an external outlet for its products; otherwise a part of the commodities representing surplus value cannot be marketed. Just as at

first capitalism built on the ruins of the pre-capitalist European economy, so later it became dependent upon the outlets provided by new colonial regions. With advancing colonization, however, the extent of colonial territories still to be brought within the orbit of capitalist exploitation is constantly shrinking. The struggle for untouched regions becomes ever more violent; capitalism turns into imperialism, resorts to wars on a world scale and sweeps on not only to economic but to political catastrophe. This conception, which rests upon the interpretation of the process of circulation of goods in the capitalist economy as it was first presented by Marx in the second volume of *Das Kapital*, is founded upon the erroneous theory that a special market is needed for the realization of at least part of the surplus value, whereas the transformation of the entire amount of surplus value into new means of production within the closed system of capitalistic markets may be easily conceived, at least in theory.

A comparison of socialist theory, which ranges all the way from abstract economic concepts to historical generalizations, with the economic theories of other schools is scarcely possible. As an economic theory socialism is linked with the doctrine of labor value, which served as the point of departure for Ricardo, but the doctrine has been impregnated with sociological connotations and elaborated quite independently. Moreover, the theory of marginal utility is also represented in socialism. The socialist conception of the labor market and of the commodity character of labor as well as the theories of concentration of capital, of the industrial reserve army and of economic crises may be easily brought into accord with the fundamental notions of marginal utility analysis. For, as Schumpeter once observed, marginalist analysis is but an organon of thought which may be applied to any concrete set of facts. The economic significance of class stratification in capitalist society may easily be evaluated by the methodology of the marginal utility approach, and the production of surplus value may be explained in terms of the special situations obtaining in the labor market. It is clear therefore that socialism does not rest on a specific, clear cut type of economic dogma, although economic theory as the theoretical interpretation of the existing social order will always constitute the core of the doctrine of modern scientific socialism.

The significance of socialist theories in the history of economic thought is that they were

the first successfully to eliminate the unhistorical approach and to set up as a problem the analysis of the specific features of capitalist economy. Indirectly, by making the theory of labor value appear inseparable from its socialist implications, they have paved the way, at least in Germany and Austria, for the acceptance of marginal utility theories and the adoption of more refined techniques for the analysis of market phenomena. They have strengthened the interest of economists in studying concrete situations. They have inspired research students to undertake investigations of social conditions, of the history and significance of handicrafts, of the concentration of capital and of similar subjects, studies which have been quite numerous since the last quarter of the nineteenth century. Finally, they have provided a most powerful stimulus for social and labor legislation.

EMIL LEDERER

Socio-Ethical Schools. As a revolt against the central classical traditions of economic theory socio-ethical economics must be distinguished from the historical and institutional schools on the one hand and on the other from the socialist school. Historical and institutional economics seek to supplement and correct classical doctrine on a factual plane, while socialist theory intends to remain on the level of the causal or functional discourse set by the classical economists even though it begins with or leads to certain ethical attitudes toward economic life. It is more difficult to draw the line of demarcation from the romantic authors and schools, whose protest against economic classicism likewise originated in the specifically human or emotional viewpoints and values neglected by classicism; indeed the boundary between socio-ethical and romantic economics assumes the character of a broad strip of common ground. And yet there are pronounced differences between the underlying principles of the two tendencies. The background of romanticism remains metaphysical or aesthetic, while that of the socio-ethical schools is more akin to religious or rationalist ethics. While romantic tendencies in economics, which have so far been related to historical and institutionalist tendencies, seem to lead to more positive and apologetic attitudes toward economic realities, socio-ethical tendencies lead up to more critical positions and consequently to manifold relationships with socialism in its various forms.

The doctrines of classicism which provoked the resistance of moralists were of very different origin, and perhaps none of them was without reservations that could have softened down its harshness in a more benevolent or even fair interpretation. Malthus' conception of the laws of population was at bottom the agriculturist's warning against industrialism and in its recited form went a long way to meet moralist objections and hopes. Ricardo's view of social progress as hemmed in by the laws of rent and of wages was originally just the opposite of Malthus' warning and hence strove even more to conciliate the "friends of humanity"; it actually furnished all the necessary weapons to socialism. Yet it was not unfairness of interpretation alone that made the amalgam of classical doctrines repulsive to the ethical critics of the "dismal science." The emphasis of that science rested on the central idea of the more or less mechanical laws of competition that came to sweep away the harassing and even immoral restrictions of mercantilism and of the "police state" at the dawn of the industrial revolution. As soon as the promised paradise of economic freedom began to reveal its specific defects and its hidden substructure of class interests, criticism was reawakened as unavoidably as the revolution of 1789 was followed by those of 1830 and 1848. To such criticism even the cautious empiricism and humane benevolence of Adam Smith might have seemed to be infected with the sordid or commonplace materialism that was thought responsible for the tragedies of the early capitalistic age. It is surely Smith's famous passage on the "romantic hopes" of the soldiers as a part of "the whole price of their blood" (*Wealth of Nations*, bk. i, ch. x, pt. i) that inspired Ruskin in *Unto This Last* with the no less famous praise of the soldier, to whom "the consent of mankind has always, in spite of the philosophers, given precedence . . . because he holds his life at the service of the State . . . does, in reality, die daily" (1899 ed., p. 25-26).

The English reaction against the classicists comes at times very near that French or German romanticism which after the Restoration was rediscovering the piety and chivalry of the "dark ages" despised by liberalism. Indeed, the economic teaching of Ruskin, like that of his master Carlyle, had that strong element of aesthetic emotionalism that made him and his followers more important for English art than for English economy. Yet the dominant strain for the whole line of thinkers was the ethical, from the militant Puritanism of Carlyle to the political socialism of

William Morris the artist. The explanation for this seems to lie in the practical genius and the religious tradition of the English.

Through its alliance with utilitarianism English classicism had anticipated many of the ethical criticisms later directed against what was bound to appear, in the light of the succeeding economic development, as its crude naturalism and even amorality. And its stoical attitude of making the best of an economic world which by its very nature cannot be the best of worlds makes its ethical critics often look inconsistent in wavering between the imperatives of better action and the assumption of better realities. The dignity of the English moralist writing on economics was therefore found mainly in the more or less conscious upholding of the religious ideals that had been attacked by the utilitarians and were to be definitely thrown over by Marxian socialism.

It is not without significance that Carlyle's principal economic book, *Past and Present* (1843), was suggested to him by the reading of a mediaeval monastic chronicle by Jocelyn de Brakelond. The description of the patriarchal rule of a great abbot attracted his attention to the religious forms of social organization, the continuity of which was in England less disturbed by the Reformation than in any progressive country on the continent, whether Catholic or Protestant. So the foundations of what on the continent came to be called social policy were in England deeply rooted in the religious traditions that reasserted themselves in nonconformism as well as in the Church of England, and in the evangelical no less than in the Oxford movement. At the same time liberalism, even as represented by a Quaker like John Bright, stood aloof, on the ground of the preestablished harmony of self-interest and competition, from most of the urgently pressing readjustments of the acquisitive society.

In this broad religious setting ethical economics has tried since Ruskin to engage in battle with the classicists not only in the sphere of practical action but also on their own ground, the plane of theory, and to dispute their fundamental theses as to the nature of wealth, the economic motive, the determination of exchange value and the causes of economic crises. As laymen in economics the moralists began with attacking the more simple generalizations, such as the place of manual labor in industry, before they passed on to the more complicated problems of functional economics. But that by no means deprives even

their earlier writings of scientific interest. Ruskin's protest against the principles of the liberal Poor Law of 1834 is a forerunner of the still unsettled controversies on world unemployment after the World War. Their avowed ethical viewpoint prevented these economists from ever conceiving of a mechanical generation of surplus value such as the early English socialists and Sismondi had believed in. But their doctrines resemble somewhat liberal socialism in that the institutions of property, inheritance and freedom of contract are postulated as ethical values rather than rejected in the manner of socialist theory or assumed as systematic premises along the lines of classical economics.

As with the progress of industrialism classical economics lost its former aggressiveness and grew apologetic in character, the writers of the socio-ethical trend came increasingly to consider themselves the legitimate and genuine successors of that "free thought in the social sciences" inaugurated by Adam Smith. John A. Hobson, the author of the book using this phrase as its title, regards himself and actually is the principal follower of Ruskin the economist; the emphasis of his economic reflections is, however, no longer on the religious but on the liberal and rationalist ethics. Yet in the numerous and somewhat prolix restatements of his fundamental conceptions he seldom reaches the scientific level of his neoclassical adversaries. Like most socialist liberals he hardly attempts to reconcile the interventionism of his opinions on arbitration and unemployment relief with the non-interventionism of his tenets on international free trade. His conviction of the ethical soundness of property makes him, quite in accordance with socialists like Sidney Webb, limit his attacks upon capitalism to the Ricardian rent concept and the Marshallian concept of quasi-rent. In his lifelong struggle against marginalism, which he feels instinctively to be the most dangerous weapon in the defense of economic reality and in the offensive against economic utopias, he has not so far rectified the elementary mathematical misapprehensions pointed out to him by Edgeworth and Marshall. At one important point he does strike upon a real weakness of the neoclassicists: their inconsistency, inherited from utilitarianism, in first neatly distinguishing economics as a formal science of means from "non-economic welfare" as a realm of social ends, and afterward introducing by a variety of back doors the kind of bourgeois ethics that prevailed in England in the first half of the nineteenth cen-

tury. But even at this point the critic's sin is graver than that of the criticized: what he would have the neoclassicists do is not to keep to their first cautious promise, but to go further and achieve the impossible by deducing from their factual premises an express system of rationalist liberal ethics.

Only recently has the leaven of socio-ethical viewpoints produced a group in English economics whose technical equipment is on a par with the apparatus of neoclassical analysis and which has therefore better prospects of fruitful cooperation with it. The school headed by Henry Clay is inspired not by individualist liberalism but by an appreciation of the economic duties and possibilities of government and hence by a more conservative bias and a skepticism of liberal socialism, which is in many respects akin to the pre-war German state or "professorial" socialism (*Kathedersozialismus*). This orientation of present day ethical economics is significant because the situation produced by the post-war disturbances of world economy and their scientific reflection in an intensified study of crises and business cycles is in many respects similar to that in which Carlyle and Ruskin first pronounced against the glories of the competitive harmony. On the plane of theory the chief object of an ethical remolding of economics has now become the attempt to supplement in terms of the Austrian school the study of functional distribution by that of personal distribution, to advance from mere abstract "factors of production" to their empirical counterparts in actual social classes and income groups.

While in England landlords and farmers have scarcely had friends among theoretical economists since Ricardo's victory over Malthus, in Germany the first protest against classicism, apart from romantic economists like Adam Müller or historical economists like Friedrich List, came from the ranks of the large proprietor farmers, titled and bourgeois, who had profited little from the individualistic legislation of the *Bauernbefreiung* and who for the most part began to feel early the pressure of capitalist markets, the scarcity of agricultural credit and the hardships inflicted by the consequent mobilization of land. Placing himself on the theoretical foundations laid by the French socialists and German idealistic philosophy Karl Rodbertus voiced this protest in a decisive attack upon the Ricardian rent concept and a corresponding call to both farmers and labor to offer united resistance to the exploitation of financial capitalism. Ideolog-

ically even more than through his intercourse with Lassalle, Rodbertus represented the potential coalition against liberalism between the old Prussian ruling class of country gentlemen and the labor and middle classes, which were as yet scarcely touched by trade unionism and Marxian socialism, a political combination relied upon by Bismarck in his earlier domestic policies. Although Rodbertus' agrarian socialism might at first sight appear to be a kind of casual crossing of antiliberal tendencies, his untiring attempts to make socialism "acceptable to Society" (*salonfähig*) must be recognized as the theoretical basis of that great social insurance legislation of the eighties and nineties which made the new German Empire a model of social policy the world over; and his conception of land as a peculiar "fund" incapable of being subjected to a purely capitalistic valuation and encumbrance has proved one of the chief stimuli to the more critical study of the concept of capital in the United States and elsewhere.

Rodbertus' central ethical position, the conservative belief in government as symbolized in the *suum cuique* of the Hohenzollern monarchy, rather than the sharper edge of his socialism or of his agrarianism, was taken over by Adolf Wagner, his pupil and admirer. Wagner, who hailed from southern Germany, blended Rodbertus' ethical views with the fine old traditions of German cameralism, a comprehensive theory of the economic aims and possibilities of government, which persisted longest in the middle sized states of southern Germany and of which he was the last great master. His restatement of the German science of public finance was not merely a great technical achievement but also the conscious continuation of that older line of German theory which in the hands of Rau and Hermann had striven to reform rather than supersede the English classical teaching. It is significant in this connection that Wagner was antagonistic to Schmoller's historical school and loved to call his master Rodbertus the "Ricardo of socialism."

A last stage in the development of German socio-ethical economics came with the hardening of German socialism into political Marxism and with the peace concluded between the bourgeoisie and the government. This stage is marked by the predominance of a legal formalism. Rudolf Stammler, the leading legal philosopher of official pre-war Germany, thought of the relation of economy and state-made law no longer as primarily a combat for supremacy in society but rather as a fundamental identity be-

tween economic "matter" and legal "form." This conception of "just law" (*richtiges Recht*), however bitterly it might be attacked by an authority of the rank of Max Weber, was broad enough in both its ethical and its social science aspects to furnish food for theoretical reflection to economists like Karl Diehl and Rudolf Stolzmann. In Stolzmann's many works, devoted almost exclusively to the methodology of economics, there appears to be a strong vein of liberal individualism laying stress on might as the necessary corollary of right, on individual wants as the material of social coordination and on economic policy as aiming to remove disturbances from the free cyclical movement of production and consumption rather than to substitute another economic order for it. Diehl, the reeditor of Baumstark's commentaries on Ricardo, has been mainly occupied with the social and legal foundations not only of capitalism but of economic systems in general.

The French branch of socio-ethical economics represented by Léon Bourgeois' *solidarisme* reflects the condition of French social and political life at the end of the nineteenth century. The theory was the result of an attempt of Bourgeois' parliamentary party, the Radical Socialists, to translate into economic and sociological theory their plan of an ideological compromise between the radical liberalism of the schools of Say and Walras and a decisive socialist or at least state socialist break with this liberalism. The relation of mutual rights and duties which this theory posits for all members of society recalls the organismic societal theories from Menenius Agrippa to Spencer and Schäffle but is so weak a reflection of both these and the religious theories of mutual responsibility of man to man that it is not altogether undeserving of Pareto's bitter description as an "excuse for those who like to profit by the other man's labors." Yet in a society of a peculiarly individualistic and conservative type, like that of France, such a compromise between liberalism and socialism had a mission to fulfil in assisting movements of voluntary joint action such as cooperation and trade unionism and in promoting moderate forms of government intervention such as factory legislation, social insurance and progressive taxation. Solidarity was thus the exact French counterpart of the Rodbertian and Wagnerian influences on the social policies of modern Germany.

While solidarity is a consciously secular theory and, like French laicism generally, represents only one of the two main streams of socio-

ethical thought in France, the other, to which solidarity is more or less sharply opposed, is the clerical or Roman Catholic stream that has been running on powerfully since the Restoration in contrast to the ideas of 1789. This division into solidarity and social Catholicism weakens the effectiveness of the theoretical constructions of socio-ethical economics in France, but it also offers the practical advantage of a double opportunity for French socialist thinkers to blunt the edge of revolutionary criticism by compromises either with liberalism or with Catholicism. While the school of Fourier has been largely merged into solidarity, the schools of Saint-Simon, Louis Blanc and Comte were closely related to the Roman church. There is also an unbroken tradition of less decidedly socialist Catholic economics reaching from Lamennais' friend de Caux, Buchez and Huet down to Marc Sagnier's *Sillon*.

Outside France and outside the more strictly theological economic conceptions taught on the basis of Aristotle and Thomas Aquinas in all other Catholic countries there has been only one other instance of theoretical economic system building for religious purposes, that of the German Jesuit Heinrich Pesch of Cologne. Educated in the atmosphere of the old scholasticism of the Rhineland and the Netherlands and influenced by the "social bishop" Ketteler of Mainz, Pesch had the chance and the courage to establish contact with the followers of Rodbertus and afterward to study with Adolf Wagner at Berlin, with the result that his researches culminated in a broad if not very deep system of economics that cuts a path between liberalism and socialism somewhat on the lines of Pope Leo XIII's famous encyclical *Rerum novarum*. Like Stolzmann, Pesch stresses the teleological unity of economic society as a system of material means for moral ends, like Le Play he insists on the importance of the family as the primary social group, and like German romantic conservatism he wants to uphold or restore the organic differences and interrelations of corporate classes (*Stände*) as an incarnation of the religious idea of divine "vocation" and as a solid bridge between the family and the state. By the readiness to take into this system the modern technical reasoning on production and distribution Pesch rises above the level of mere religious sociology and is distinguished from the many practical forms of "Christian" economics in his own church, in the Anglo-Saxon churches and sects and in German Protestantism, which in so far as they take up

economic problems in earnest develop definite leanings toward socialism. Before Pesch produced his economic system there was a moment at which the Protestant and conservative Christian Social party founded by Adolf Stöcker at Berlin in 1878 seemed to be approaching a position of its own, chiefly through the assistance of Adolf Wagner. But after Wagner left the party this opportunity was lost, and it has not returned.

CARL BRINKMANN

Romantic and Universalist Economics. Although it was accorded universal acclaim throughout Europe Adam Smith's *Wealth of Nations* could stimulate a development of indigenous economic thinking along classical lines only in those countries where, as in France, the prevailing spiritual atmosphere was favorable. As Friedrich List clearly showed in his celebrated writings of the 1840's, the theoretical and practical acceptance of "English political economy" in Germany would have checked all industrial progress. The political will for the development of the country into an "agricultural-manufacturing-commercial" state was bound therefore to prevent at least for a time the victory of free trade economics. Yet this political opposition would perhaps have come too late to be effective had not philosophical opposition already become strongly entrenched by the end of the eighteenth century. The latter took the form of romanticism, which rejected the philosophy of the Enlightenment and weakened the tenability of economic theory based on it. Eighteenth century philosophy had postulated a rationality pervading all forms of life, reduced all phenomena to the manifestation of a single principle and all institutions to a typical contractual arrangement of free individuals, proclaimed the sovereignty of natural law embodied in a series of causal relationships and believed in the existence of a natural order which would suit equally well all nations and all ages. To this calculating and analyzing rationality of the Enlightenment the romantics opposed their feeling that life is manifold, limitless, unfathomable. And so they came to stress doctrines of organic growth and of physical and spiritual acclimatization; to focus their attention on the growth of individuals and the history of nations, on the evolution of symbols and cultures, of the political and the economic order; to oppose the conception of a developing and living whole to the notions of causally linked atoms and of rationally grouped individuals. This *Weltanschauung* underlies romantic economic theory.

The romantic economists did not, however, constitute a school of thought. The poet Novalis, the philosopher Franz von Baader, the political journalist Josef Görres and the publicist Adam Müller developed their views on politics and economics quite independently of one another and none of them found disciples to continue his work. There are therefore only a few economic propositions common to them all; and an idea of romantic economics could best be obtained by uncovering the specifically romantic elements in the teachings of the foremost representative of romanticism in the social sciences, Adam Müller, the author of *Die Elemente der Staatskunst* (1809) and the *Versuche einer neuen Theorie des Geldes* (1816).

According to Müller the constitutive economic principle is not free competition but the integration of individuals and classes into a living community, whose spiritual bonds set a limit to the logically limitless division of labor and specialization among men. The emphasis on material wealth leads to a neglect of the more essential "ideal" production and of the importance of the whole for single production processes and individual articles. Value does not inhere in the product; it is derived from the fact that the product is available in society. Money, the foremost embodiment of value, can be understood only within the framework of the society and the state and as a reflection of them.

Romanticism stimulated the development of the historical sense in the nineteenth century; in fact, general historiography as well as the legal and economic history of this age of *Historismus* can be understood only in the light of the influence exercised by romanticism. But on economic theory in the stricter sense the latter left no significant impress. Müller failed to develop his ideas into a formal theoretical system and the rising tide of liberalism paralleling the growth of industrialism consigned to oblivion the abiding verities in Müller's work along with its obsolete and reactionary elements. The account of romantic economics and the treatment of economic life and the state along romantic lines in Othmar Spann's *Haupttheorien der Volkswirtschaftslehre auf lehrgeschichtlicher Grundlage* (1911), in which his views, later developed in many directions, were first propounded, came therefore as an entirely new discovery. According to Spann an economy is in its objective aspect "a system of means" and in its subjective aspect "the selection and adaptation of means to ends"; all economic phenomena are therefore

"organic parts of a structure of services." The ideas of organic relationship to a whole and of service ability in regard to the whole are applied to every primary economic action and unit. A hierarchy of "wholes" is established, at the apex of which are the national and world economies and finally the state. The state is not merely another form of association alongside the economic community but, on the contrary, the economic system is but a manifestation and a foundation of instrumentalities for the purposes of the state, whose institutions and laws are to be viewed as creative economic factors, as capital of a higher order. From this point of view non-sociological economic theory based on abstraction and mental isolation is inconsistent with the nature of social economy and of the state. Individualism must be charged with failure to recognize the significance of wholes and of justice, the supreme principle of the political and economic order.

Spann designates this social, political and economic doctrine as universalism; and the name universalist may be applied to his school in order to distinguish it in the field of economics from the classical school. Yet the universalist outlook, even according to Spann's conception, is not limited to this small group but constitutes the common characteristic of a continuous line of philosophers, political thinkers and economists extending from antiquity to the present. This universalism embraces the totality of social life, as may be clearly seen from a few of Spann's fundamental propositions. The first of them is that the individual is not autonomous and self-sufficient, because his life is an organic part of a larger whole. The whole therefore comes before and is superior to the part. The individual is not thereby deprived of spiritual dignity or moral autonomy; for the whole is after all a certain organic combination of its members, who are endowed also with a life of their own. Another of Spann's propositions related to society, which far from being merely a sum of the individuals composing it is a creative living whole whose members are essentially interdependent and mutually complementary. Aristotle's *justitia distributiva* in its more modern form of *suum cuique*, the perfect expression of the eternal principle of justice, is the law determining the structure of society.

Spann has attempted not only the statement of all the ramifications of universalism but, also with the aid of his pupils, the building of a comprehensive doctrinal system based on universalist principles. An introduction to this system is

contained in the collection of his articles *Tote und lebendige Wissenschaft* (1921) and in the textbook of the history of economic doctrines, the *Haupttheorien* mentioned above, while a sketch of the system is attempted in his *Fundament der Volkswirtschaftslehre* (1918). The methodology of universalism is presented in his *Kategorienlehre* (1924), the sociology in his *Kurzgefasstes System der Gesellschaftslehre* (1914), the social philosophy in his *Gesellschaftsphilosophie* (1928), the political science in his *Der wahre Staat* (1921) and the philosophy in his *Der Schöpfungsgang des Geistes* (1928). Some of his pupils have undertaken a further development of universalism in application to philosophy (Karl Faigl, *Ganzheit und Zahl*, 1926), to the theory of business cycles (Walter Heinrich, *Grundlagen einer universalistischen Krisenlehre*, 1928) and to public finance (Wilhelm Andreae, *Grundlegung einer neuen Staatswirtschaftslehre*, 1930; and *Bausteine zu einer universalistischen Steuerlehre*, 1927).

The central doctrine of universalist economics is not the theory of prices, as in individualistic economic systems, but the theory of services. In a theoretical construction which conceives an economy as a system of means service is naturally not to be understood as a technical causal category, but rather as a concept bearing on structure, on the articulation of the parts with the whole. The doctrine of services thus interpreted is supplemented by the doctrine of differentiation of the whole of the highest order into wholes of lower orders and their constituent elements. The explanation of value and price is thus undertaken not with the aid of such concepts as marginal utility, but through the establishment of relationships which the goods, conceived as a means for a given purpose, bear to the whole.

Whereas the trend of individualistic price theories since the time of Adam Smith has been away from such metaphysical notions as normal value and natural value and toward a closer concern with actual or market price, universalist economics has attached the greatest importance to just these meta-economic concepts. The important task of a price theory, the universalists would say, is not the explanation of prices preferably in terms of a single cause, but the ascertainment of the degree of correspondence between prices and the underlying structural relations of parts and wholes. The structural relations in the economic system are normative for prices, and the universalist correct price, unlike the scholastic *justum pretium*, is thus determined

by strictly economic criteria. An economist is supposed to go even beyond that; where prices are found to be incorrect, suggestions should be forthcoming for a rearrangement of parts and wholes to bring about the correction of structural faults.

The concept of service makes it possible for the universalists to reject both utility value and labor value, and together with the latter the Marxian theory of capitalist appropriation of surplus value. In opposition to the doctrine of sole productivity of labor the universalists maintain that a great many general costs are incurred in the process of production and must be covered from its proceeds. Thus in addition to wages, interest, compensation for risk and services of the entrepreneur there are salaries of government officials and other costs of local administration; the cost of maintenance of the productive capital of society collected in the form of taxes; the necessary contributions to capital invested in the education of the young, to capital needed for the employment of the increasing population of workers and to capital increases requisite to insure economic progress. The residuum represents pure profit, which is not an exploitation income but a compensation for the services of leadership exercised by the entrepreneur.

The universalist theory of money rejects the view that money is only the reflection and measure of commodity value. On the contrary, money is a productive instrument and its function is to bring about a proper coordination of primary economic elements, parts and wholes of various orders. In this sense it is an essential constitutive element of value. The objection to the older monetary theories like the quantity theory is that they concentrate on the quantitative aspects of money value and overlook the importance of studying the nature of money value as such.

Universalist economics regards business crises as disturbances in the proper coordination of means which constitute the economic system. These disturbances may arise from a shifting in purposes to which the means are subservient or may follow a shift in the relationships of the various means. Examples of the latter are a change in the relation of a single national economy to the world economy; the effects of new inventions; change in capital of the higher order, i.e. commercial treaties, tax legislation and the like.

Those to whom economic theory means clas-

sical, marginal utility or neoclassical doctrine regard the essential parts of universalist economics as metaphysical and as having no relevance to the science of economics as such. It is not surprising therefore that some surveys of German economic theory do not even mention universalism. A more intelligent appreciation of the role of universalism must rest on recognition of the fact that the development and acceptance of different variants of economic theory are historically conditioned phenomena and that no theory may justly claim eternal and universal validity. In fact, except for a few doctrines, such as the law of diminishing returns and the law of differential rent, accepted by all schools of thought economics today is divided between two diametrically opposed points of view giving rise to two essentially different types of theory. It is comparatively unimportant whether one distinguishes them with Spann as universalist and individualistic or with Sombart as *Geistwissenschaft* and natural science theories or with Harms as synthetic and analytic or with Salin as intuitive and rationalistic, so long as the essential difference in the underlying approach is kept clear. Müller's romantic economics and Spann's revival and further development of it in the form of universalist economics may be best understood and evaluated as a variant of economic theory based on a philosophy rejecting the individualist, rationalist, analytic, natural science approach. It is significant in this connection that classic individualist theory was developed in England, the home of utilitarianism, and that the universalistic theory is a creation of the German spirit, which left its impress also on historical economics, another form of theoretical opposition to English utilitarianism and atomism. But universalism is not simply a nationalist German contribution to social thought. At the time when the individualistic-liberal state is passing through a crisis in many countries and in others new political and economic forms are gradually emerging, universalism offers the first well developed organic theory of society, the state and economic life.

EDGAR SALIN

The Institutional School. The form assumed by the dissent from orthodox economics has differed from country to country and from period to period. In the United States such dissent has come in the twentieth century to be increasingly and indeed almost exclusively associated with what has been called the institutional school.

Yet the numerous proponents of the institutional approach to economics differ so markedly in their views concerning the purpose, content and methodology of institutional economics and the bonds of spiritual unity among them, engaged as they are in diverse and vaguely related tasks, are so intangible that the use of the term school is justified only if the loosest possible meaning is attached to it. Nor is it to be inferred that the institutional approach to economic theory is exemplified only in the work of American economists or that before the twentieth century an institutional emphasis in economics was unknown.
